The improvements introduced by Arnold are too numerous and of too technical a character to be fully described here; but those which attracted most notice were the detached escapement, which allows the vibrations of the balance, which is the real measurer of time, to be more free and equal than an ordinary timepiece, by completely detaching it, during the greater part of each vibration, from the train of wheels; and the expansion-balance, which, being formed of two metals of unequal expansibility, varies in form in such a manner with changes of temperature as to vibrate in nearly equal periods of time at any degree of heat or cold to which a chronometer can be exposed. Subsequent discoveries have proved that the principle of the expansion-balance, as used by Arnold, is radically defective when the instrument is liable to considerable changes of temperature; yet it was a great improvement upon the principle introduced by Harrison, which consisted in applying a compensation for changes of temperature to the balance-spring, on the same plan as the regulator of a common watch, excepting that the compensation apparatus was self-acting, instead of having to be altered by hand. Since the time of Arnold the compensation-balance has been used almost universally, and with scarcely any alteration from the form in which he left it. The French chronometer-maker Le Roy, appears to have invented previously, but unknown to Arnold, both the escapement-balance, and an inferior form of the compensation-balance. Two experimental watches made by Arnold, and now in the possession of the Royal Society, appear to contain his first attempts at the detached escapement.

Another very important improvement introduced by Arnold, and adopted by all his successors, was what is commonly called the cylindrical balance-spring, which is more perfect in its action than the ordinary spiral balance-spring. He appears also to have been the first to make balance-springs of gold, for the sake of avoiding corrosion; and he applied silver and platinum to the formation of balances, in order to avoid the evils which had been discovered to arise, during a thunder-storm, from the magnetism of steel. In addition to his mechanical improvements, Arnold may be considered the first manufacturer of chronometers in England, or the first who, by systematising the business of chronometer-making, reduced the price of those important machines to such an amount as to render them generally available.

In 1780 Arnold published, by permission of the Board of Longitude, 'An Account kept during Thirteen Months in the Royal Observatory at Greenwich, of the going of a Pocket Chronometer' made by him, with his newly-invented balance-spring, and his expansion-balance, in which he observes that the greatest difference from mean time shown by his chronometer in any one day had never amounted to four seconds of time, or one mile of longitude, which, he observed, enabled it to determine the longitude to as great precision as the latitude was generally determined; and during the thirteen months there were but three days on which the difference amounted to three seconds a day. The whole accumulated error of the thirteen months was not greater than the difference to which two observations of the moon on the same day were liable. He had then, he states, applied himself for nearly thirteen years to the improvement of the chronometer, and he continued to do so until his death, on the 25th of August, 1799. Though a highly ingenious man, he was not a very expert or delicate workman, and the models made by his own hand are comparatively clumsy; but Earnshaw, who was one of his assistants, and who subsequently obtained notice as a labourer in the same department of ingenuity, was well able to make up for this deficiency of mechanical dexterity.

Shortly after the death of Arnold, Earnshaw laid claims before the Board of Longitude, which Arnold's son, the late John Roger Arnold, who died on the 26th of February, 1843, thought fit to contest, in the name of his father. The decision of the board in 1805 gave an equal reward (3000*l.*) to both. In the following year the board published, in a thin 4to volume, illustrated with plates, 'Explanations of Time-Keepers constructed by Mr. Thomas Earnshaw and the late John Arnold.'

(Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge.*)

ARNOLD, SAMUEL, Doctor in Music, was born in 1740, and patronised from his birth by the princess Amelia, daughter of George II., who placed him among the choristers of the royal chapel, under Mr. Bernard Gates: he afterwards completed his musical studies under Dr. Nares. His first production was an air, 'If 'tis joy to Wound

a Lover,' which immediately spread itself far and wide, and made the author popular. At the age of twenty-three he became composer to Covent Garden theatre, and in 1766 also undertook to fill the same office at the Haymarket, then the property of the senior Colman. In the discharge of these duties he produced about forty musical pieces, the most popular of which were—'The Maid of the Mill;' 'The Son-in-Law;' 'The Castle of Andalusia,' in which are 'Flow, thou regal purple stream,' and 'The Hardy Sailor;' 'Inkle and Yarico,' &c. Of music of the graver cast, he composed Dr. Browne's sacred ode, 'The Cure of Saul,' which was allowed to be the best work of the kind since the time of Handel. This was followed by the oratorios of 'Abimelech,' 'The Resurrection,' and 'The Prodigal Son,' which were performed at the Covent Garden and Haymarket theatres for several years during Lent. The latter was chosen for performance at the installation of Lord North as Chancellor of the University of Oxford, when the composer was honoured with the degree of Doctor in Music. In 1769 he purchased Marylebone Gardens, then a place of very fashionable resort, for which he wrote many songs, &c.; but he had to abandon this speculation with the loss of 10,000*l.* In 1783 he was appointed organist and composer to the king. In 1789 he succeeded Dr. Cooke as conductor of the Academy of Ancient Music, and in 1793 became organist of Westminster Abbey. In 1786 Dr. Arnold commenced publishing an edition in score of Handel's works, encouraged by George III., who liberally supported him in his arduous undertaking, which proceeded to the extent of about forty volumes. He also printed, in four large volumes, a collection of sacred music, as a continuation of Dr. Boyce's admirable work, to which it has proved a most valuable addition. During many years he carried on the oratorios at Drury-lane theatre, and while these were in his hands he produced 'The Redemption,' a compilation from Handel's works; and 'The Triumph of Truth,' selected from various composers. Dr. Arnold died in 1802, and was interred in Westminster Abbey, with more than usual marks of respect. A simple tablet, near Purcell's monument, marks the place where lie his remains.

ARNOLD, THOMAS, D.D. The events in the life of this able man and distinguished schoolmaster are comparatively few. Thomas Arnold was born at Cowes, in the Isle of Wight, June 13, 1795. His father, William Arnold, was collector of the customs in that place, where the family, originally from Lowestoft in Suffolk, had resided for two generations. His education when a child was under the direction of his aunt. At the age of eight he was sent to Warminster, and four years afterwards to Winchester College. As a boy he was remarkably shy and indolent, a character which presented a strong contrast to the frankness and activity of his subsequent life. At school his favourite pursuits were history and poetry. Having written a play, and a long poem after the manner of Scott, he was called Poet Arnold, to distinguish him from another boy of the same name. In 1811, in his sixteenth year, he was removed to Oxford, having obtained a scholarship in Corpus Christi College. Here, stimulated by the love of the real, which was one of the prominent features of his character, he devoted his attention chiefly to the philosophers and historians of antiquity, among whom his favourite authors were Aristotle and Thucydides. He is represented by those who knew him to have been at this time fond of discussion and vehement in argument; fearless in advancing his opinions, and stiff in maintaining them; extremely liberal in his views, which he held with a firm conviction of their truth, but which often startled the Church and State Tories by whom he was surrounded. With this intellectual boldness and independence he combined no arrogance or conceit, but a disposition so generous and affectionate, that those who differed most widely from him in opinion never failed to respect and love him, many of whom continued his friends to the latest period of his life. In 1814 he took a first-class degree, and the year after was elected Fellow of Oriel College. In 1815 and 1817 he was chancellor's prizeman for the Latin and English essays. Having overcome certain scruples respecting some points in the Thirtynine Articles, with which he appears to have been harassed about the time he graduated, he was ordained deacon in 1818, and priest in 1828, when he undertook the chaplaincy of Rugby school. In 1820 he married Mary, youngest daughter of the Rev. J. Penrose, rector of Fledborough, Notts, having in the previous year settled at Laleham, near Staines, where he employed himself in the preparation of seven or eight young men for the universities. Here a great and decisive change came over his character. The indolence and restlessness by which his early years had been marked entirely disappeared, and he acquired those settled, serious, earnest views of the nature and purpose of life, which actuated him ever after. It was this "intense earnestness" which gave him so much power over his pupils, and which roused every one who came within the sphere of his influence to the consciousness that they had powers to cultivate, duties to discharge, and a mission to accomplish. The time which was not occupied with his pupils was devoted to collecting materials for his edition of 'Thucydides,' writing articles on Roman history for the 'Encyclopædia Metropolitana,' and preparing the way for his 'History of Rome,' which he did not live to finish.

In August 1828 he entered upon his duties as head master of Rugby School, to which he had recently been elected. Here his great talents for instruction and the management of young men acquired a suitable sphere for their activity. The result was soon apparent, not only in

the eminence which Rugby rapidly obtained, but in the beneficial change which, by its example, was impressed upon other institutions of a similar nature. Dr. Arnold retained the old classical basis of tuition, but gave it breadth by connecting it with other departments of learning; inspired it with life and vigour by the practical views to which he directed it; and imparted to it elevation and dignity by what had heretofore been wanting in public schools—the introduction of a high moral and Christian element: so that Rugby became in the true sense of the word the seat of an enlightened and Christian education. He treated his pupils with the affection of a friend and the courtesy due to gentlemen, as well as with the authority of a master. As he could not come into frequent personal contact with every one among them, he governed the school, and made his influence felt through the whole of it, by means of the sixth form, or highest class of boys. To add to their authority, and for the sake of maintaining order and government among the boys themselves, he kept up the system of flogging; but he stripped it of its repulsive features and invested it with a moral force, by making it the ground of a solemn responsibility on the part of those who exercised the power. His views on this subject will be found in the 'Journal of Education,' 1834-5, to which there is a Reply by Professor Long, the editor of that work.

In this occupation he spent the last fourteen years of his life: and during that period, though so diligently engaged in his own proper duties, took the deepest interest in all the public events and political questions of the time. He was one of the most decided opponents of the Oxford new school of theology. His idea of a Christian church was first given in his pamphlet on 'Church Reform,' which he was induced to publish in 1833, in consequence of the apprehensions he entertained of the danger which then threatened the establishment. His theory is much the same as Hooker's, that the church and state are identical—that a church is a Christian state. His views on this subject are again stated in his 'Fragment on the Church,' subsequently published; in which he hits the key-stone of the Tractarian heresy, in attacking what he considers to be their false notions of the Christian priesthood.

In 1835 the office of a Fellowship in the Senate of the new London University was offered to Dr. Arnold by Mr. Spring Rice, the Chancellor of the Exchequer, and the office was accepted. Dr. Arnold at first consented to join the University "without insisting on a Scriptural examination, on the alleged ground of fact, that such an examination was not practicable on account of the objections of different classes of Christians, and on the hope, which he distinctly expressed, that the Christian character of the University might be secured without it." But he subsequently became convinced that "the Scriptural examination was both practicable and all but indispensable, and he gave notice of his intention of recommending the introduction of the Scriptures as a part of the classical examination for every degree." In December 1837 he succeeded in carrying a resolution "that, as a general rule, the candidates for the degree of Bachelor of Arts shall pass an examination either in one of the Four Gospels or the Acts of the Apostles in the Original Greek, and also in Scripture History." In consequence of the remonstrances from various bodies of Dissenters and from the Council of University College, London, and partly in consequence of the strong representation of the Secretary of State (Lord John Russell), through whom an appeal had been made by the remonstrants to the law officers of the Crown, a larger meeting of the Senate of the University of London was held in February 1838, in which the former motion was overruled, and in its place it was resolved, "the examination in the Hebrew text of the Old Testament, and in the Greek text of the New, and on Scripture History, shall be instituted in this University; and that all candidates for degrees in arts may, if they think proper, undergo such examination." The Senate immediately proceeded to institute a voluntary examination, with prizes, in the texts of the Old and New Testaments and in Scripture History. Dr. Arnold finally withdrew from the Senate of the London University in November 1838, being led, "after the fullest consideration and inquiry, to the conclusion that the voluntary examination would not be satisfactory" (Letter to the Earl of Burlington, Stanley's 'Life of Arnold,' ii. p. 126), or, as he expresses himself in another passage of the same letter, would not "satisfy, either practically or in theory, those principles which appeared to him indispensable." The history of this transaction is given at length in Stanley's 'Life of Arnold' (ii. p. 10, &c.), and Dr. Arnold's views and opinions appear from various letters in the same volume (pp. 13, 83, 91, 94, 107, 126).

Dr. Arnold's mind was early directed to the social condition of the working classes of this country; and many efforts were made, and a variety of plans devised by him, not only for improving it, but for directing the attention of the public to a subject of so much importance. For this purpose he gave lectures at the Rugby Mechanics' Institute, started a newspaper in 1831 expressly for the use of the lower orders, and in the same year, and also in 1832, wrote letters in the 'Sheffield Courant' and subsequently in the 'Herts Reformer.' He was one of the first to perceive the necessity of introducing a moral element into the measures intended for the social benefit of the masses; without which the extension of the franchise would be useless, if not pernicious.

The Whigs, to which party he was more nearly assimilated in opinion

than to any other, offered him some preferment, which he did not accept. The year before his death, however, he was appointed by Lord Melbourne to the Regius-Professorship of Modern History at Oxford—an appointment which gave him the most lively satisfaction. But he lived to deliver only his introductory course of lectures. When at the very summit of his reputation as a teacher, and at the time when the odium in which, for the liberality of his religious and political opinions, his name had been held by men of his own profession was fast disappearing, and the grandeur of his character was every day becoming more manifest and more distinctly understood, he was seized with a fatal disease, which carried him off in a few hours. He died on the 12th of June, 1842, of spasm at the heart, and was buried in the chapel at Rugby. He left a widow, with five sons and four daughters. Scholarships to his honour, bearing his name, have been founded by subscription.

His correspondence is the best record of his life, and affords the most vivid representation of his character. It presents us with the progressive development of his mind and views, till the one reaches the vigour and the other the comprehensiveness for which at length they became distinguished. He combined the intellectual and the moral in a degree and with a harmony rarely found. The most strongly-marked feature of his intellect was the strength and clearness of his conceptions. It seemed like the possession of an inward light, so intense that it penetrated at the instant every subject laid before him, and enabled him to grasp it with the vividness of sense and the force of reality. Hence what was said of his religious impressions may be used to characterise his intellectual operations:—"He knew what others only believed; he saw what others only talked about." Hence also perhaps arose in a great measure the vehemence with which he opposed views and notions contrary to his own. Of his moral nature, honesty and fearlessness, earnestness, and love of truth and justice, were the prominent qualities. And though these were calculated to give an aspect of sternness to the outline of his character, yet they were tempered with an expansive benevolence, and combined with a tenderness of disposition, which rendered him an object of the most devoted attachment to all about him. It was said by one who knew him well, that "he loved his family as if he had no friends, his friends as if he had no family, and his country as if he had neither family nor friends."

His great work, and the one by which he will be remembered, are his three volumes of Roman History, comprehending the period between the origin of the state and the end of the Second Punic War; with another volume comprising his contributions to the 'Encyclopædia Metropolitana,' and carrying on the history to the time of Trajan. In the Notes and Dissertations to his edition of Thucydides, he has given a social and political as well as a critical interest to his author. History and divinity—man and man's relation to God—were his favourite studies. In both he preferred the practical to the theoretical. His five volumes of sermons demonstrate with what earnestness and devotion he laboured to bring religion into the daily concerns of men, and to invest every act of life with a Christian character.

His remaining productions are—a volume of 'Lectures on Modern History,' delivered at Oxford, and 'Miscellaneous Works,' which include many articles written for Reviews, &c., and Essays.

(Stanley, *Life and Correspondence of Dr. Arnold.*)

*ARNOTT, DR. NEIL, was born in 1788. His father was of the Arnotts of Upper Dysart, near Montrose, on the east coast of Scotland, of whom several had rank in the public service. His mother was the daughter of Maclean in Inverness-shire. His early years were passed partly at Dysart, and partly at the house of Blairs, on the Dee-side, a few miles from Aberdeen.

In 1797 he went to the Grammar School at Aberdeen, where Lord Byron happened to be then also a scholar. In 1801, having at the annual examination obtained the first prize in his class, he left the school for the University. In the competition for bursaries or scholarships there, he was also a successful candidate. He then chose as his business for life, the medical profession, and his course of study was shaped accordingly. Natural philosophy, as an important scientific foundation, was a favourite study. In 1806, having taken his degree of M.A., he went to London to complete his professional education. He there became the pupil of Sir Everard Home, Surgeon of St. George's Hospital. Through the influence of his preceptor he obtained at an unusually early age the appointment of surgeon in the naval service of the East India Company. This position afforded him not only opportunities of witnessing the influence of climates on health and disease, but also, during his residence in the many places visited, of testing and amplifying the general scientific conceptions formed at the University. Many of the striking facts and incidents in geology, astronomy, natural history, navigation, &c., presented to him during these voyages were used by him afterwards as illustrations in his work entitled 'The Elements of Physics.'

In 1811 he settled in medical practice in London. The knowledge which he had acquired of modern European languages served to widen his connection amongst strangers in London. In 1813 he gave at the then flourishing Philomathic Institution, near Tavistock-square, an elementary course of lectures on chemistry and natural philosophy. In 1815 he was appointed physician to the French embassy in London, and subsequently also to the Spanish embassy. In 1823-24 views

were promulgated by Sir David Barry, and others, on the circulation of the blood, irreconcilable with the laws of hydraulics. Dr. Arnott's opinion was requested by Dr. Armstrong, then Lecturer of Medicine at the Borough hospitals, and by others of his professional brethren. He was induced by these circumstances to deliver a course of lectures on Natural Philosophy in its application to medicine. In the year following he was requested to repeat these lectures; but not having the time to spare, he published in 1827 the substance of his course with additions under the title of 'Elements of Physics, or Natural Philosophy, General and Medical, explained in plain, or non-technical Language.' Of this work five editions, amounting to 10,000 copies were called for within six years, and the work was translated into all the European languages except Italian. The author published originally only the first half-volume; and he had become so occupied professionally that the chapters on Light and Heat were ready only with the third edition, and the two remaining chapters on Electricity and Astronomy had to wait until still further leisure. Although the profit was tempting, and the copies of the extant editions when met with were selling for more than the original price, the author did not choose to republish the work until he could complete it, and add the account of various new appliances to physical means for attaining professional objects which had occurred to him during his studies and practice—such as, for instance, the water-bed, or floating mattress, which in cases of patients confined to bed has been used with such happy results.

In 1838, however, seeing that a large part of the art of guarding the public health, or preventing disease, depended on the right management of the great physical influences, among which temperature and purity of air are the chief, he attempted to awaken public attention to these, and the prevalent misconceptions regarding them, in a short 'Essay on Warming and Ventilating,' in which new means of avoiding some common evils were described. Considerable progress has since been made in this kind of knowledge; but the history of late attempts to warm and ventilate the Houses of Parliament, shows how little opinions are yet settled on the subject.

For the inventions and novel applications of Dr. Arnott above referred to, and further modifications of these—of which the smokeless fire is one—the Council of the Royal Society awarded to him in 1854 their Rumford Medal; and for these and other novelties bearing on the treatment of disease, and the preservation of the public health, for medicine, surgery, and hygiene, the Jurors of the Class of the Universal Exposition of Paris in 1855, awarded to him the great Gold Medal, which was accompanied by the Cross of the Legion of Honour given by the Emperor.

In 1835 Dr. Arnott was placed by the Government among the members of the Senate of the University of London then created. In 1837 he was named one of the Physicians Extraordinary to the Queen. In 1838 he was elected a Fellow of the Royal Society, and has twice been member of the Council. In 1854 he was requested by the President of the General Board of Health to be one of his Medical Council. He has now retired from the more active business of his profession to complete his literary and scientific undertakings, and it is understood that the sixth edition of his 'Elements of Physics,' with the chapters on 'Electricity and Astronomy,' will soon appear.

One of the most remarkable characteristics of Dr. Arnott is the disinterestedness with which he has thrown open his inventions for the general benefit of mankind. In the case of the water-bed it could scarcely have been otherwise, with one of such practical benevolence. It was invented by Dr. Arnott upon a sudden emergency; and it saved the life of the patient who was first placed upon it, as it has saved many other lives. But if the 'Arnott Stove' and the 'Arnott Ventilator' had been patented, the inventor would have realised a large fortune by their almost universal use. He judged otherwise; and he has had something higher than a money-reward. A particular notice of Dr. Arnott's contrivances for health and domestic comfort, will be given in the division of ARTS AND SCIENCES.

AROMATARI, JOSEPH OF, a learned physician and naturalist, was born about 1586 at Assisi, a town of the duchy of Spoleto, in the Papal states. His father was a physician, and carefully trained his son for the same profession. His studies were begun at Perugia, and continued at Padua, where he studied successively logic, philosophy, and medicine. He obtained his degree of Doctor of Medicine in his eighteenth year, and immediately afterwards established himself as a physician at Venice, where, notwithstanding the most tempting offers and solicitations made to him by the Duke of Mantua, the King of England, and Pope Urban VIII., he continued to practise until his death, July 16, 1660.

During this long period he devoted himself to his profession, to the study of the mode of generation or reproduction of plants and animals, and to literature. He accumulated an immense library, extremely rich in manuscripts. His best known publication connected with polite literature was, 'Riposte alle Considerazioni di Alessandro Tassoni sopra le Rime del Petrarca,' Padua, 1611, 8vo. To which Tassoni having replied under the assumed name of Crescenzo Pepe, Aromatari answered under a fictitious name, in the following work: 'Dialoghi di Falcidio Melampodio in riposta agli Avvertimenti dati sotto nome di Crescenzo Pepe a Giuseppe degli Aromatari,' Venice, 1618, 8vo. He also under the pseudonym of Subasiano edited a col-

lection of the works of several authors, in 8 vols., 4to, Venice, 1643, entitled, 'Raccolta degli Autori del ben parlar.' His contributions to medicine and natural history consist in 'Disputatio de Rabie Contagiosa, cui preposita est Epistola de Generatione Plantarum ex Seminibus,' Venice, 1625; and Frankfurt, 1626, 4to. The 'Epistle' has been repeatedly reprinted; it appears in the 'Philosophical Transactions,' vol. xviii. p. 150, London, 1694. This 'Epistle,' addressed to Dr. Bartholomew Nant, does not occupy more than three pages, and gives only the outline, or heads of chapters, of a large work which he intended to write on generation, but which his numerous professional engagements and delicate health prevented his accomplishing. But it is remarkable inasmuch as the views, however imperfectly developed, are far more in accordance with those of the most distinguished vegetable anatomists and physiologists in the present day, than many of those generally entertained for a long period subsequent to the time in which he lived. He taught that the so-called seeds of plants were not, as a whole, the new plant, but the ova of plants, and that a very small portion of a seed (the embryo) possessed the principle of life, the rest, which he called the milk of the seed, being intended for the nourishment of this part. The development of this embryo, he says, takes place in a twofold direction, a portion of it ascending, and constituting the plumule, the other descending, and constituting the radicle. His principles respecting the generation of animals were adopted, and promulgated by Harvey in his treatise 'De Generatione.' His views respecting seeds appear to have been overlooked, except by a very few.

ARPAD, the founder of the kingdom of Hungary, succeeded his father Alom, a chief of the Magyars; according to some writers in A.D. 889, according to others in 892. It was about the former year, according to Mailath, that the Magyars, a wandering warrior tribe, crossing the Carpathian Mountains from Galicia, first entered the country, which they subsequently conquered, and which their descendants have since retained. The country they entered was then subject to many princes, mostly of Slavonic origin. Arpad sent an embassy to one of them, named Zalan, offered him twelve white horses as a present, and demanded in return all the land from his camp to the river Sajó, which Zalan, unprepared for resistance, durst not refuse. Gelo, prince of Transylvania, who returned defiance, was defeated and slain, and Transylvania became subject to the Magyars. The emperor Arnulf, instead of endeavouring to check the advance of the invaders, invited their assistance against his Slavonic enemy, Zwentibold, prince of the Marahans. The Magyars readily accepted the offer, and on their march totally defeated Zalan, who, having collected an army, attacked them at Alpar, in the hope of recovering his rash concession. They were equally successful against Zobor, the commander of Zwentibold's army, whom, after their victory, they hung. The whole country between the Theiss and the Danube was now in their power, but their career of conquest was not yet finished; Glado, another Slavonic prince, was vanquished, and his country taken possession of. Maróth, who succeeded in repulsing them on their first onset, fled on their second approach, and sent large presents, offering his daughter as the wife of Zoltan, Arpad's infant son. By the acceptance of this proposal his dominions fell as effectually under the Magyar power as if they had been taken by the strong hand. Arpad fixed his residence in an island of the Danube, called Tsepel, from which he thenceforward governed all Hungary. Some of his chieftains afterwards pressed onward into Italy and besieged Venice, but were repulsed; others broke into Bavaria, where they plundered without check, but were afterwards defeated by the margrave Luitpold. Arpad died in the year 907, leaving for his successor his son Zoltan, then a boy of thirteen. The line of Arpad continued to occupy the throne of Hungary till the death of King Andrew III. in 1301.

(Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge.*)

ARRHIDÆUS, a bastard son of Philip III. of Macedonia, who, on the death of his half-brother Alexander (B.C. 323) was elected his successor, under the name of Philip, by acclamation of the Macedonian troops (Diod. xviii. 2) and consent of Alexander's generals. His title was strengthened by marrying Eurydice, grand-daughter of Perdicas, Philip's elder brother. Being of weak intellect, he was a mere tool in the hands of others; and at length, falling into the hands of Olympias, was, with his wife Eurydice, put to death (B.C. 317). [ANTIGONUS; ANTIPATER; PERDICAS.]

ARRIANUS, FLAVIUS, a native of Nicomedia in Bithynia, was born towards the end of the first century after Christ; he probably assumed the name of Flavius Arrianus when he acquired the rights of a Roman citizen. He was governor of Cappadocia in the twentieth year of Hadrian, or A.D. 136. Arrian was a pupil of Epictetus probably during that philosopher's residence at Nicopolis. Epictetus, with other professors of philosophy, had been banished from Rome in the reign of Domitian, A.D. 89, and it does not appear that he ever returned there. Arrian first made himself known by publishing the doctrines of his master Epictetus; and to the reputation which he thus acquired, assisted probably by the friendship of the Emperor Hadrian, who had been on intimate terms with Epictetus, he owed his future promotion. He first obtained as a reward the Athenian citizenship, subsequently that of Rome with the rank of senator. According to Heliconius, who is cited by Suidas and Photius, he

attained the consulship, but his name does not appear in the *Fasti Consulares*. In A.D. 137, Cappadocia was disturbed by a native chief, Pharasmanes, whom Dion Cassius (ix. 16, Reimar's ed.) calls the leader of the Albani; but the disturbance was checked by fear of the Roman governor.

Hadrian died in A.D. 138, and we hear no more of Arrian in public life. He may have retired to his native city, where he held the priesthood of Demeter and Persephone—a post of honour, and probably of profit also. It was in the latter part of his life that he wrote those numerous works, some of which have come down to our time, and have preserved his name and reputation. He lived to an advanced age, but the date of his death is unknown. The following are the extant works of Arrian:—1. The *History of Alexander's Conquests*, entitled 'The Anabasis, or Ascent of Alexander,' that is, into Asia, in seven books, is a work of great merit, and if viewed with reference to the importance of the subject, and the want of other trustworthy authorities, one of the most valuable histories that are extant. The contemporary historians of Alexander are lost, but Arrian's 'Anabasis' supplies their place. It begins with the death of King Philip, B.C. 336, and contains the events of Alexander's life from that date to the death of Alexander at Babylon, B.C. 323. The narrative of Arrian is simple and concise, without any affectation of rhetorical ornament; the military operations are clearly described; and a tone of good sense and moderation pervades the book. Alexander, his hero, is a favourite with him, and his faults are gently touched, but they are not concealed. Our present knowledge of Asia, and more particularly of the basin of the Indus, enables us to test the accuracy of Arrian as a geographer, and in this important requisite of an historian he is not deficient. Some critics are of opinion that Arrian was a young man when he wrote this work; but this is very improbable, as well from the character of the work as the account which he gives in it of himself and of his previous employments. The first edition of the Greek text of the 'Anabasis' was by V. Trincavelli, 1535, 8vo, Venice. The most recent editions are by J. E. Ellendt, Königsberg, 1832, 2 vols. 8vo; and C. W. Krüger, Berlin, 1835, 1 vol. 8vo, which contains the text and the various readings. There are German, French, and Italian versions of the 'Anabasis.' It was translated into English by John Rooke, London, 1729, 2 vols. 8vo. 2. The little work entitled 'Indica' contains a sketch of India, of the inhabitants, their habits, and the animals and products of the country, founded on the authority of Eratosthenes and Megasthenes. It also contains an abridgment or *Journal of the Voyage of Nearchus* (c. 20, &c.), who was appointed by Alexander to conduct his fleet from the Delta of the Indus to that of the Euphrates. This work is written in the Ionic dialect. It may be considered a kind of Supplement to the 'Anabasis.' The 'Indica' is one of the most interesting monuments of antiquity; as, with the exception of the brief notices in Herodotus and the strange stories in Ctesias, it contains the first authentic account of the nations of India, and also the details of the first European navigation along that desolate coast which lies between the Indus and the entrance of the Persian Gulf. The authenticity of the *Journal of Nearchus* has been established by Vincent, in 'The Voyage of Nearchus,' London, 1807. The more exact acquaintance which we have obtained in recent times with the coast along which the fleet of Nearchus sailed, has established the veracity of the *Journal*, in a way which will satisfy the most sceptical critic. An edition of the 'Indica' by Schnieder, in 8vo, appeared at Halle in 1798. The best modern editions of the 'Indica' are those by Ellendt and Krüger. 3. 'The Periplus of the Euxine Sea' contains a brief account of Arrian's coasting voyage along the Black Sea from Trapezus (Trebizond) to Dioscurias, then called Sebastopolis. The rest of the Periplus to Byzantium is not founded on Arrian's personal knowledge, but on other authorities, as is apparent from the work. It is printed in Hudson's 'Minor Geographers,' &c., vol. 1, with Dodwell's Dissertation 'De Aetate Periplus Maris Euxini.' There is an anonymous 'Periplus of the Euxine and Maotis,' which is not by Arrian. (Dodwell, 'Dissertatio de Auctore Anonymo Periplus Euxini Maris.') 4. Of the 'Alan History' the fragment entitled 'The Order of Battle against the Alans' is probably a fragment. Photius mentions an Alan History by Arrian; and it is possible that the passage in Dion Cassius, already referred to, in which he speaks of Pharasmanes, and this fragment may refer to the same events. But the true reading in the passage of Dion Cassius appears to be 'Albani,' and not 'Alani' (Dion Cassius, ix. 15, ed. Reimar, and the note); and perhaps this work ought to be entitled 'Albanian History.' This fragment was first edited by J. Scheffer, Upsal, 1664, 8vo; and it is contained in Blancard's edition of Arrian's minor works, Amsterdam, 1683, 8vo. 5. The 'Discourse on Tactics' was written in the 20th year of Hadrian, as the author states in a passage of the 'Tactic.' What remains is apparently only part of a large work; it treats chiefly of the discipline of the cavalry. It was first edited by J. Scheffer, Upsal, 1664, 8vo; and is printed in Blancard's collection. 6. The 'Discourse on Hunting' was written by Arrian in imitation of Xenophon's treatise on the same subject, and to supply its defects. The author says that he "bears the same name (Xenophon), and belongs to the same city, and from his youth up has been busied about the same things (as the elder Xenophon), hunting, generalship, and philosophy." The Greek text was first edited by Lucas Holstenius, Rome and Paris, 1644, 4to, with a Latin version. There is an English version of the treatise, which

was published at London, 1831, with notes, and embellishments from the antique. Gellius (l. 2) says that Arrian digested the discourses of Epictetus ('Dissertationes Epicteti'), and Photius speaks of eight books of the discourses of Epictetus by Arrian. There are now extant four books of a work entitled the 'Epictetus of Arrian.' Photius also attributes to him a work in twelve books 'On the Conversations of Epictetus;' and Simplicius says that he wrote on the life and death of Epictetus, but it is uncertain whether he means to say that this was a separate work, or a part of one of the two works above enumerated. The consideration of these works, and of the 'Manual of Epictetus' belongs to the 'Life of Epictetus.' [EPICTETUS.]

Arrian was a voluminous writer. Besides his extant works he wrote a work in seventeen books, entitled 'Parthica,' on the wars of the Romans under Trajan against the Parthians; a history of the events which followed the death of Alexander, in ten books, the loss of which is much to be regretted, as there are few good materials for the history of this busy period. Photius has preserved a list of the contents of this work; the history of Timoleon's expedition against Dionysius of Syracuse, and the history of Dion of Syracuse, and his contest with the second Dionysius, are mentioned by Photius; a history of Bithynia, his native country, in eight books, from the mythical times to the death of the last king, Nicomedes, who bequeathed his kingdom to the Romans; and the Life of Tilloborus, a distinguished Asiatic robber.

The 'Periplus of the Erythrean Sea' is printed in the first volume of Hudson's 'Minor Greek Geographers,' with the dissertation of Dodwell, 'De Aetate Periplus Maris Erythraei ejusdemque Auctore.' It contains an account of the commerce which was carried on from the Red Sea and the east coast of Africa to the peninsula of India, in the first or second century of our era. The 'Periplus of the Erythrean Sea' was first published by Froben at Basle, 1533, with a Preface by the editor Gelenius. Whatever may be the authority for calling it the 'Periplus of Arrian,' it can hardly be by Arrian of Nicomedia. The author appears from the work to have been an Egyptian Greek, who sailed from Egypt, as far at least as the Bay of Cambay. The 'Periplus of the Erythrean Sea' consists of two parts: one part comprehends the coast of Africa, from Myos Hormos on the Egyptian coast of the Red Sea to Rhapta, and is elucidated in the first part of Dr. Vincent's valuable work on the 'Periplus of the Erythrean Sea,' containing an account of the Navigation of the Ancients from the Sea of Sues to the coast of Zanguebar, London, 1807, 4to. The second part also begins at Myos Hormos and follows the Arabian coast of the Red Sea and the ocean, and then, passing to Guzerat, follows the Malabar coast to Ceylon. It is elucidated in the second part of Vincent's work "containing an account of the Navigation of the Ancients from the Gulf of Elana in the Red Sea, to the Island of Ceylon." Vincent is inclined to fix the date of the composition about the tenth year of Nero's reign, and to place the alleged discovery of the Monsoons in the Indian Ocean by Hippalus, in the reign of Claudius. This 'Periplus' is a valuable record of the commerce of the Indian Ocean under the early Roman emperors.

In the fragment on the Alan War, Arrian calls himself Xenophon. Xenophon, the son of Gryllus, was the model that he proposed to himself, and the parallel between the elder and the younger Xenophon is curious. The son of Gryllus was an Athenian by birth; the Xenophon of Nicomedia was made a citizen of Athens. Xenophon recorded in his 'Memorabilia' the moral doctrines of his master Socrates; Arrian has preserved those of his teacher Epictetus. Xenophon gave to his history of the expedition of the younger Cyrus the title of the *Anabasis*; Arrian gave the same name to his history of Alexander. Xenophon wrote 'Hellenica,' or a general history of Grecian affairs, beginning from the point where the history of Thucydides ends; Arrian wrote a history of Alexander's successors. Xenophon and Arrian were both fond of field-sports, and both wrote treatises on hunting. If the parallel is not complete in all its parts, it is complete enough to show that Arrian came as near to his model as he could. He imitated the plain and simple style of Xenophon, and not unsuccessfully. He had a good share of vanity, and was courtier enough to know how to forward his interests; but he was apparently an honest man, and as an historian, geographer, and moral writer, he ranks among the distinguished names of the Greeks.

The complete edition of Arrian's works by Borheck, 3 vols. 8vo. Lemgo, is of no value. The editions of the separate works are very numerous.

(Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge*.)

ARRIAZA, JUAN BAUTISTA, one of the most noted modern Spanish poets, was born at Madrid in 1770. After his first studies at the seminary of nobles in that capital he entered the military college at Segovia, and on quitting it began to serve in the navy; but owing to an incurable defect of vision he was obliged to renounce that career in 1798, previous to which he had published a small volume of poems entitled 'Las Primicias.' After quitting the navy he came to England in quality of secretary to the Spanish embassy, and here completed his 'Emilia,' a didactic poem, chiefly referring to the fine arts and their influence (published at Madrid, 1803). After spending about two years at Paris, he returned home in 1807, just before the breaking out of the revolution in Spain, when he took an active and prominent

part as a supporter of legitimate monarchy. He published his sentiments first in his 'Poesias Patrioticas,' wherein he abjured his countrymen to maintain their national independence; and next in his prose 'Discursos Politicos.' This zeal on behalf of monarchy and legitimacy did not pass unrewarded by Ferdinand VII., who bestowed on him various marks of favour, and among other appointments that of secretary of council; also a post in the ministry for foreign affairs. He died at Madrid in 1837.

As a poet, Arriaza ranks high among contemporary Spanish authors. Six editions of his poems, exclusive of a Paris one, appeared in his lifetime. Independently of their political interest, to which undoubtedly a large share of their popularity must be ascribed, they are remarkable for felicity of style and beauty of versification.

ARROWSMITH, AARON, was born in Winston, Durham, on the 14th of July, 1750, and died on the 23rd of April, 1823. His father dying while he was young, his mother married again, and the second husband, a dissipated man, wasted the children's patrimony. Aaron was thus early thrown on his own resources; and the only instruction he ever received, except in the mere elements of reading and writing, was in mathematics, from the eccentric Emerson, who had ceased teaching, but was so taken by the boy's anxiety to learn that he taught him for a winter. Arrowsmith came to London about 1769 or 1770. He soon obtained employment from Cary, for whose large county maps he made most of the pedometer measurements and drawings. Arrowsmith continued with Cary till near 1790, when he published his large map of the world on Mercator's projection. He had by miscellaneous reading, and by inquiries of naval officers and others, accumulated a stock of materials that did not appear on any map, and employed the hours he could save from his employer's task-work to construct one of his own. When the map was ready he took a small house in the neighbourhood of Leicester-square, and had it advertised as published. For some time it hung upon his hands; but the captains of whaling ships soon appreciated its value and freely purchased it; and the map, from the distinctness of its engraving and the great additional information it contained, attracted general attention. From this period his career was one of uniform progress and prosperity. In 1794 he published his great map of the world on a globular projection, with a 'Companion' of explanatory letter-press. This was followed in a short time by his map of the northern regions of America.

Arrowsmith's maps obtained a high reputation throughout Europe for their distinctness, the result of good engraving and arrangement. It has been the fashion of late to undervalue his acquirements as a geographer; but though he is inferior to Berghaus, and some other map-makers of the present day, he was superior to any one in Europe at the time when he commenced his career. Those who depreciate him owe great part of their own superior knowledge to the impulse given to geography by the untiring assiduity of Arrowsmith in collecting new information. He was not a profound mathematician or man of science, but he had a complete understanding and mastery of the theory and practice of his art, as is shown by his 'Companion to a Map of the World,' published in 1794; his 'Memoir relative to the Construction of the Map of Scotland,' published in 1807, which appeared in 1809; and his 'Geometrical Projection of Maps,' published in 1825, after his death. He lived in London, a city more than any other in Europe favourable to the collection of geographical information, and in the age of Dalrymple, Rennell, and other distinguished promoters of geography, by whom he was appreciated and employed, and who not only imparted their views to him, but freely communicated their collections, while his European reputation as a constructor of maps caused materials to flow in upon him from the travellers of every country. His 'Memoir on the Map of Scotland,' published in 1807, contains abundant proof of his diligence in collecting information, and of the modesty and good faith with which he sought the advice and assistance of men eminent in science or letters. This map is the first map of Scotland that in the slightest degree approximated to accuracy. Arrowsmith's maps exceed one hundred and thirty. The school atlases and skeleton maps for Eton College, and the manuals of geography, ancient and modern, by Aaron Arrowsmith, are the works of his son.

(Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge*.)

ARSA'CES, the founder of the great Parthian monarchy, and whose name was borne by all his successors, who were thence called the Arsacidae. His descent is doubtful, but he was probably a Scythian. Justin speaks of him as being "of doubtful origin, but tried valour, used to live by robbery; who, in the belief that Seleucus (Callinicus) was conquered by the Gauls in Asia, attacked Andragoras, the governor of the Parthians, and took possession of the empire of the nation." (xli. 4.)

According to Arrian (ap. Phot. 'Bibl.' No. 58), a personal and family quarrel led him to raise the standard of revolt from the Syrian empire, B.C. 250, during the reign of Antiochus Theos, father of Seleucus, who, busied with his Egyptian wars, neglected this new source of disturbance until Arsaces had gathered a sufficient party to resist him successfully. Seleucus Callinicus made two expeditions into Parthia; the first failed, and in the second he was defeated in a great battle, taken prisoner, and died in captivity. The day of that defeat was long observed by the Parthians as the commencement of their independence. Arsaces reduced the neighbouring district of Hyrcania, and died, according to Justin, in a ripe old age.

Obverse.

Reverse.

British Museum. Silver.

The small coin which we here give must rather be considered as a specimen of the coinage of the dynasty than as one which can with certainty be referred to any individual of the Arsacidae. Eckhel ('Catalog. Mus. Cæsar. Vindob.' &c., i., p. 253) attributes this small coin to Arsaces I. or Arsaces II.; Frölich assigns it to Arsaces I. Visconti ('Iconographie Grecque') assigns the large silver medal (which is magnified to twice its linear measure) to Arsaces VII., and the small one to Arsaces II.

From Visconti.

ARSE'NIUS, the son of Michael Apostolius, a Greek man of letters, was born, probably in the island of Crete, towards the end of the 15th century. Arsenius conformed to the Latin church, and became an ecclesiastic. He lived in Rome in the pontificate of Leo X., but received no preferment from that pope. Under Paul III. he was made archbishop of Malvasia, or Monembasia, a town on the eastern coast of the Morea, not very far from the promontory of St. Angelo. He published a collection of Apophthegms of remarkable men in Greek; the apophthegms were collected by his father, and Arsenius prefixed to them a dedication in Greek to Leo X. He also published Scholia on the first seven plays of Euripides, taken partly from Moschopoulos, Lascaris, and Thomas Magister—partly from earlier sources. Venet. 1534. This work was dedicated to his friend and patron Pope Paul III. (Fabric. *Bibl. Gr.*, vol. i., p. 655-56; vol. x., p. 222 and 491, &c.; Crusius, *Turko-Grecia Libri Octo*, 146-51; Chardon de la Rochette, *Mélanges de Critique et de Philologie*, v. 1., 238; Bayle.)

ARSINOË, a daughter of Ptolemæus I., son of Lagus, king of Egypt, and of Berenice, was born about B.C. 316; and was married about B.C. 300 to Lysimachus, king of Thrace, then so far advanced in years that his eldest son, Agathocles, had already espoused Lysandra, the half-sister of Arsinoë. In order to marry Arsinoë, Lysimachus had separated from his wife Amastris, and on her death a few years afterwards he presented Arsinoë with the cities of Amastris, Dium, and Heracleia. Arsinoë desirous of securing the succession of her own children, prevailed on Lysimachus to consent to the death of Agathocles. Lysimachus found himself involved in war with Seleucus in consequence of this atrocious proceeding. He was defeated and killed on the borders of Cilicia, B.C. 281, and his kingdom of Macedonia was taken possession of by Seleucus. Seven months afterwards Seleucus was assassinated by Ptolemæus Ceraunus, the elder brother of Ptolemæus Philadelphus; who also treacherously put to death the two children of his half-sister, Arsinoë, after he had induced her under promise of marriage to admit him into the city of Cassandria in Macedonia, o

which she held possession. Arsinoë succeeded in escaping to the sacred island of Samothrace; whence she soon after went to Alexandria in Egypt, to become the second wife of her brother, Ptolemæus II. Philadelphus. This was the first example of an unnatural custom which prevailed among the Greek kings of Egypt, the origin of which it is difficult to account for. Arsinoë, who was now advanced in years, bore no children to her brother, but she was much beloved by him, and he called one of the districts of Egypt by her name. The architect Dinocrates was employed by Ptolemæus to erect a temple to her honour, and he intended it should be arched with loadstones, so that her statue, made of iron, might have the appearance of being suspended in the air. The death of the architect prevented its completion. We thus find that the Mohammedans of Medina were not the first to whom this strange idea had occurred. (Plin. xxxiv. 14.) Strabo (x. 460) attributes to this Arsinoë the founding of a city called by her own name on the banks of the Achelous in Ætolia. A statue of Arsinoë existed at Athens in the time of Pausanias (i. 8). The beautiful medal of Arsinoë, which we have given, with a cornucopia on the reverse, confirms what Athenæus says (xi. chap. 13), "that the kind of cup or drinking vessel called Ruton was first devised by Ptolemæus Philadelphus as an ornament for the statues of Arsinoë;" but the word ruton as applied to a kind of drinking cup is found much earlier.

British Museum. Gold.

ARSINOË, daughter of Ptolemæus III. Euergetes, was married to her brother, Ptolemæus IV. Philopator: she is called Eurydice by Justin, and Cleopatra by Livy. She was present at the battle of Raphia, fought between her husband and Antiochus the Great, B.C. 217, and is said to have contributed not a little to gain the victory. [ANTIOCHUS.] Ptolemæus afterwards, seduced by the charms of Agathocles, ordered Arsinoë to be put to death somewhere about B.C. 210. (Justin, xxx. 1; Polyb. xv. 33.)

ARSINOË, a daughter of Lysimachus, king of Thrace, was the wife of Ptolemæus Philadelphus, by whom she had three children, Ptolemæus, Lysimachus, and Berenice. Suspecting that she was plotting against his life, Ptolemæus banished her to Coptos, or some city of the Thebais. (Schol. Theocr. xvii. 128.) Niebuhr and some other authorities are of opinion that she escaped and fled to Cyrene, where she was married to the king, Magas, who was the half-brother of Ptolemæus Philadelphus. There is however great difficulty in identifying Arsinoë the wife of Magas with the daughter of Lysimachus. Magas, in order to put an end to the quarrel existing between Ptolemæus and himself, had betrothed his daughter Berenice to the son of Ptolemæus; but the death of Magas put an end to the negotiations, and Arsinoë gave her in marriage to Demetrius, son of Demetrius Poliorcetes, whom she summoned from Macedonia for this purpose. Demetrius, on his arrival, according to Justin, gave his affections to Arsinoë, instead of her daughter, which led to his assassination, and the marriage of Berenice and Ptolemæus III., by which the kingdoms of Cyrene and Egypt were again united. (Justin, xxvi. 3; Schlosser, Th. ii.; Abth. l.)

ARTABANUS, the last of the Parthian dynasty of the Arsacids, succeeded his brother Vologeses IV. Herodian relates that Caracalla, the son of Septimius Severus, having asked and obtained in marriage the daughter of Artabanus, entered the country with a Roman army, and in the middle of the festivities gave orders for a massacre, A.D. 216, in which numbers of the Parthians perished, and the king himself escaped with difficulty. Indignant at this gross treachery, Artabanus took the field with a numerous army. After a hard-fought and indecisive battle of two days, the Romans came to terms, by informing the Parthian king of the death of Caracalla, against whom he was chiefly incensed, and offering to restore the treasures seized by Caracalla, as well as to pay a large sum of money. But in this war Artabanus had lost a large part of his army and prisoners and booty taken at Ctesiphon. Artaxerxes, or Ardshir, took advantage of the losses sustained by the Parthians to incite the Persians to revolt. The Parthians were defeated in three great battles, in the last of which Artabanus was, after three days' hard fighting, taken, and put to death, A.D. 226. The Parthians in consequence became subject to the Persians, after having been their masters for 475 years.

ARTAXERXES, or ARTOXERXES, King of Persia, surnamed Longimanus (in Greek Macrocheir), from his right hand being larger than his left, was the second son of Xerxes I., and succeeded to the throne on the murder of his father and his elder brother Darius by Artabanus, B.C. 465. He himself narrowly escaped assassination from the same hand, but his superior strength saved him in the struggle, and Artabanus fell by a blow from his dagger. This event was fol-

lowed by the insurrection of his only remaining brother Hystaspes, who was satrap of Bactria; but the king soon succeeded in reducing the rebellious province. The Egyptians, thinking the disturbed condition of the kingdom afforded them a favourable opportunity to recover their independence, of which they had been deprived by Cambyses, rose in arms under Inaros, B.C. 460, and nearly freed their country from the yoke of the Persians. They at the same time received a numerous body of Athenian auxiliaries. Artaxerxes sent his brother Achæmenes to reduce them to obedience, but he was defeated and slain. In a second expedition which he sent under Artabazus and Megabyzus, the Athenians were obliged to evacuate the country, B.C. 455. They still however continued the war, and sent a body of troops under Cimon to take possession of Cyprus. Cimon defeated the Persians several times, and had nearly reduced the whole of the island when he was cut off by disease, B.C. 449. Peace was then concluded, according to the later Greek writers on very humiliating terms: but of these Thucydides was not aware, and they are now generally regarded as a subsequent fabrication. Soon after peace was concluded Megabyzus revolted, but was ultimately pardoned; and Artaxerxes seems to have spent the remainder of his life in peace. He died after a reign of forty years, B.C. 425, and was succeeded by his son, Xerxes II. (Thucyd. i. 104-110; Diodorus, lib. xi. xii; Ctesias, *Persica* in *Phot. Bibl.*, p. 119; or, Baehr's ed. of Ctesias, 1824.)

ARTAXERXES II., king of Persia, surnamed Mnemon from the excellence of his memory, was the eldest son of Darius II. and Parysatis, and succeeded to the throne on his father's death B.C. 405. His mother hoped to obtain the crown for her younger son, Cyrus, on the ground of his being the first born after the accession of his father. Artaxerxes suspected his brother, and would have put him to death but for the intercession of his mother, who obtained his pardon, and even his continuation in the command of the maritime provinces of Asia Minor. At Sardis Cyrus collected a large force with the intention of usurping the throne, and proceeded with these troops and a body of above 10,000 Greek mercenaries to attack the king. This is the celebrated expedition of which Xenophon has left us so interesting an account. A decisive engagement took place at Cunaxa, B.C. 401, about forty miles from Babylon, in which Cyrus gained the victory, but being himself slain in the battle, the result was the complete establishment of Artaxerxes on the throne. The Lacedæmonians were encouraged to enter Asia by the weakness of the Persian monarchy, which the expedition of the 10,000 had revealed to all Greece. Agesilaus, at the head of the Spartan troops, overran the greater part of the western provinces of Asia Minor, and would probably have reduced the whole of the peninsula, if Artaxerxes by bribery had not succeeded in exciting a Grecian war against Sparta. Agesilaus was recalled to the defence of his country, and the Persians soon afterwards gained a naval victory near Cnidus, principally by the assistance of Conon the Athenian, B.C. 394. The Spartans were at last induced to sign a treaty, B.C. 387, which gave up everything for which they had been contending. [AGESILAUS.] The only war which Artaxerxes conducted in person was an unsuccessful expedition against the Cadusii, a people inhabiting the mountains on the west and south-west side of the Caspian Sea. His efforts to reduce Egypt were fruitless. Artaxerxes was a weak and licentious man. During the early years of his reign he was under the influence of his mother, Parysatis, who governed with excessive cruelty through the agency of slaves and eunuchs. Artaxerxes had only three legitimate sons; but according to Justin he had by his concubines no less than 115 sons. He married his own daughters, Amestris and Atossa, the first example in Persian history of such an unnatural alliance. His son Darius he put to death in consequence of a conspiracy which he had formed against him. Artaxerxes died from grief on account of the bad conduct of Ochus, the youngest of his legitimate sons, B.C. 362, and was succeeded by Ochus. (Plutarch, *Life of Artaxerxes*; Diodorus, lib. xiii. xiv.; Ctesias; Xenophon, *Anabasis*.)

ARTAXERXES III., called Ochus before he ascended the throne, was the third son of Artaxerxes Mnemon. He began his reign by putting to death all those of the royal family from whom he thought himself likely to incur danger. He was cowardly as well as cruel, but by means of his Greek generals he succeeded in subduing the satrap Artabazus who had revolted, and in reducing Phœnicia and several towns of Candia and Egypt. He was at length, B.C. 339, assassinated by Bagoas, his favourite eunuch, an Egyptian by birth; who placed on the throne his youngest son, Arses. (Diodorus, lib. xvi. xvii.; Justin, x. 3; Plutarch, *Agessilaus*.)

ARTEDI, PETER, a distinguished naturalist, the second son of Olaus Artedi, was born 22nd February, 1705, at Anund in Angermanland, a province of Sweden. He was destined for the church, and in 1716 was sent to the school of Hernösand, and thence in 1724 to the University of Upsal; but he gradually abandoned theology and at length devoted himself entirely to natural history; adopting however medicine as his profession. Even when a school-boy he had spent most of his leisure hours in the study of fishes and the collection of plants; and by constant attention he had made himself so far master of the science that when Linnæus, who in 1728 went to Upsal to study medicine, on inquiries who among the students was pre-eminent, all answered Peter Artedi; on which Linnæus sought his acquaintance. At this time, according to Linnæus's description of him, he was tall,

thin, with long black hair, and a countenance resembling that of John Ray, judging by the portrait of the English naturalist. Their friendship continued through the whole period of their residence at Upsal, which was seven years. Their scientific studies were pursued in concert. Physiology, chemistry, and mineralogy they studied together. The study of fishes and the amphibia was assigned to Artdi, while Linnæus gave his attention to birds and insects. In testimony of their friendship, before the departure of Linnæus for Lapland and of Artdi for England, they mutually constituted each other heir to their papers and collections of natural history, the survivor pledging himself to publish whatever manuscripts might seem worthy of the public eye.

In September, 1734, Artdi sailed from Stockholm to London, where he met with the most courteous reception, particularly from Sir Hans Sloane, who gave him the free use of his fine museum. During his stay in London he wrote the preface to his 'Ichthyologia.' In 1735 Linnæus, after his Lapland tour, went to Leyden, where, after residing a few weeks, he was agreeably surprised to find himself joined by his friend Artdi. The means of Artdi being almost exhausted, he meditated a return to his native land; but a very different fate awaited him. Albert Seba, an old and wealthy apothecary of Amsterdam, who had collected an unrivalled museum of objects of natural history, had published two volumes descriptive of quadrupeds and serpents, and when about to publish a third volume on fishes, he requested the assistance of Linnæus; but he, too much occupied with other matters, declined the task, and recommended Artdi. Previous to this Artdi had assisted Linnæus in his great 'Systema Naturæ,' particularly in the departments of fishes, and in the umbelliferous plants. Having entered upon his new office, he drew up for the work of Seba, the descriptions, the synonymes, the genera, and species of nearly all that remained.

About this time, Linnæus, having finished his 'Fundamenta Botanica,' hastened to Amsterdam to show it to Artdi, who on his part showed Linnæus his 'Philosophia Ichthyologica,' which had been the work of several years' labour. But this friendly interchange of ideas soon experienced a melancholy interruption. Artdi, on the 21st September, 1735, when returning to his lodgings from the house of Seba, fell into one of the canals of Amsterdam, and no assistance being at hand, he was not discovered till morning. Thus, in the thirtieth year of his age, perished one whom Linnæus justly pronounced an honour and ornament to his country.

Linnæus found among the papers of Artdi the 'Philosophia Ichthyologica' alone finished; the 'Synonymologica,' a work of immense labour, complete, but confused; the 'Descriptions,' good; the 'Bibliotheca,' unfinished; and the 'Systema' nearly complete. He devoted more than a year to render these works complete, and then gave them to the world, preceded by a well-written life of the author, in 1 vol. 8vo, Leyd. 1738. Linnæus had previously availed himself of them, for the department of fishes, in his 'Systema Naturæ,' published at Leyden in 1735. The great work of Artdi was, as Cuvier observed, the first which gave a truly scientific character to the natural history of fishes, completing that which had been so well begun by Willoughby and Ray. Artdi's was a strictly natural arrangement, having founded his orders solely upon the consistence of the skeleton, upon the opercula of the gills (branchiæ), and the nature of the rays of the fins. In his botanical labours Artdi was not so successful. The researches of Sprengel, Kook, and Decandolle, have furnished an arrangement of the umbelliferous plants much superior to that of Artdi. Linnæus called a genus of umbelliferous plants after his friend, *Artdia*, of which only one species is known. *A. squamata*. Artdi's 'Ichthyologia' was reprinted and enlarged by J. Waldbaum, three volumes 4to, Lubeck, 1788, 1789, 1792.

ARTEMIDORUS, surnamed Daldianus, from Daldia, a small town of Lydia, which was the birthplace of his mother, is the author of a work in five books, entitled 'Oneirocritica,' or 'The Interpretation of Dreams.' He lived in the time of the Antonines, and collected his materials by travelling in Greece, Asia, Italy, and other countries, and registering such communications as he was favoured with by those who studied the interpretation of dreams. (Lib. I. cap. i.) The value of the work, which is written in very fair Greek, consists partly in the strange stories it tells, but more in the incidental notices of manners and usages, and in the view which it gives of the superstition about dreams in that age. It is also useful for the explanation of several mythological allusions and symbols. The first edition was by Aldus, 1513, 8vo; the last by Reiff, Leipzig, 1805, 2 vols., 8vo, one of text and the other of notes. An English translation was published in 1644, in 12mo, under the title of 'The Interpretation of Dreams, digested into five books, by that ancient philosopher Artemidorus.' Of this work a tenth edition was published in 1690. Artemidorus intimates that he wrote other works, but only the 'Oneirocritica' has come down to us.

ARTEMIDORUS of Ephesus wrote a treatise on general Geography, in eleven books, besides some other works. He wrote probably about B.C. 100. His geographical work is very often quoted by Strabo as authority, by Pliny in his 'Natural History,' by Stephanus of Byzantium in his 'Dictionary,' and by other writers. The passages thus quoted are collected in Hudson's 'Minor Greek Geographers,' vol. i. We can collect from Strabo that Artemidorus visited Spain, Rome,

and Alexandria. He was sent on an embassy from Ephesus to Rome, in order to recover two valuable salt-lakes near the mouth of the Cayster, which belonged to the temple of Diana, but had been seized by the Roman publicani (farmers of the taxes). Artemidorus was successful, and was rewarded with a golden statue placed in the temple of the goddess. (Strabo, xiv. p. 642.)

ARTEMISIA, the daughter of Lygdamis, became queen of Halicarnassus when her husband died. She was one of the most distinguished women of antiquity, if we may credit the account given by her countryman Herodotus. She attended Xerxes in his expedition against Greece, B.C. 480, and furnished five ships, which were second only to those of the Sidonians. In the council of war before the battle of Salamis, she strongly represented to Xerxes the folly of risking a naval engagement, and the event justified her opinion. In the battle she displayed such courage that Xerxes declared "the men behaved like women, and the women like men." To her Xerxes intrusted the care of his children, that they might be transported in safety to his kingdom. (Herod. vii. 99, viii. 87-103.) She was represented in the Persian portico, which was erected to commemorate the great defeat of the Persians. (Paus. iii. 11.) She is not subsequently mentioned in history; but of her death a fabulous account is given by Photius: having become enamoured of a young man named Dardanus of Mydos, and finding her passion not returned, she caused his eyes to be put out whilst he slept. This provoked the anger of the gods, and she was condemned by an oracle to go to the rock of Leucas, whence she threw herself into the sea. Other unfortunate lovers in antiquity, as will be remembered, are said to have followed her example. But most modern scholars agree in regarding the phrase of "leaping from the Leucadian rock" as merely a poetical expression, without any foundation in historical fact.

ARTEMISIA, daughter of Hecatomnus, king of Caria in Asia Minor, and wife of Mausolus, whom she succeeded on his death, B.C. 352. She reigned two years, carrying out in all respects the policy of her husband, for her attachment to whom she is indeed chiefly celebrated in history. She is said by Pliny to have mixed his ashes in her daily drink, and to have slowly pined away in grief for his loss. She proposed two prizes for the best panegyrics on her husband, one in poetry and another in oratory. The successful competitors were Theopompus and Theodectes. She caused a monument to be erected at Halicarnassus to the memory of Mausolus, which, for its grandeur and magnificence, was considered one of the seven wonders of the world. It was called 'mausoleum' from the name of her husband, and hence the name mausoleum came to be applied to such funeral monuments as are of more than usual splendour.

ARTEVELD, JACOB, a great popular leader in the early part of the 14th century, was a native of Ghent. Louis, then count of Flanders, had married a niece of Charles le Bel, king of France. On the death of his grandfather, Robert de Bethune, a dispute arose between Louis and Robert de Cassel, his uncle, about the succession, which was decided by the parliament of Paris, supported by the king of France's power, in favour of Louis. By his violent conduct Louis had made himself obnoxious to his subjects, particularly in the great commercial towns. The four principal chartered communes, or municipalities, of the county of Flanders, were Ghent, Ypres, Bruges, and the county or district of Bruges which was called Le-Franc, or 'free country.' Bruges repeatedly revolted against Count Louis, and at last took him prisoner, and kept him till the people of Ghent, who were then jealous of their neighbours of Bruges, rescued the count. Another and a more general insurrection of the Flemish was put down by Philip de Valois, who had succeeded Charles le Bel; he defeated the Flemish in a great battle at Mount Cassel in 1328, and obliged them to surrender at discretion. The leaders were put to death, and the towns were heavily taxed.

The war which broke out some years after between Philip de Valois and Edward III. of England, gave occasion to another revolt of the Flemish towns. This time Ghent took the lead, and the burghers elected for their captain Jacob Arteveld, a brewer according to Froissart, who superseded the authority of the count, and was in fact the ruler of Ghent. Jacob had the great qualities, as well as the vices, frequently found united in the character of a demagogue. He was active, eloquent, and bold; but violent, overbearing, and tyrannical. He flattered the people, proscribed the nobles, and divided their spoils among those of his own party. Edward of England having sent messengers to Flanders, for the purpose of bringing the Flemings to act with him against Philip of France, Arteveld declared for him, and induced the people of Ghent to form an alliance with the English Count Louis, who was attached to King Philip, opposed Arteveld's intrigues, and in a diet held in the town of Bruges, he caused one of the promoters of the English alliance to be seized and beheaded at Ruppelmonde. The people of Ghent, infuriated at this proceeding, marched to Bruges, and compelled its burghers to join the English alliance; and the insurgents, strengthened by the assistance of the English, defeated the count and his nobles, who were obliged to evacuate Bruges. The count withdrew to France, but returned again in 1338, and made an attempt to conciliate his refractory subjects. Having entered Ghent, he tried to persuade the popular leaders to side with him and with Philip of France; but the burghers shut the gates, made the count prisoner, and compelled him to sign a treaty of

alliance offensive and defensive with King Edward (December, 1339). Louis soon afterwards found means to escape from Ghent, and again withdrew to Paris. In 1341, a truce being agreed upon, King Edward went to Ghent to meet Count Louis, whom he tried to win over to his side, but without success. After Edward's departure from Ghent on his return to England, Count Louis, seeing his subjects wholly estranged from him, and his authority openly set at naught by Arteveld, once more withdrew to Paris. Arteveld now proposed that Edward's son, the young Prince of Wales, afterwards called the Black Prince, should be elected governor of Flanders, on the understanding that the country was to be made by Edward a sovereign duchy; but the Flemings mistrusting Arteveld's intentions, a dispute broke out at Ghent between the various trades, in which the fullers were arrayed against the weavers, and a battle was fought in the great market-place between the two factions, which lasted all day: 1500 fullers were killed, and the weavers, being victorious, abolished the corporation of the fullers, and consequently excluded them from any share in the government of the town. Arteveld had not taken an open part in the contest, but being jealous of the rising authority of Gerrard Denys, the dean of the weavers, he secretly introduced into Ghent 500 English soldiers, whom he lodged in his premises. Denys and the weavers cried out treason, attacked Arteveld, and killed him, with many of his English soldiers, in July, 1344. Arteveld's authority in Flanders lasted seven years, during which, in spite of many acts of violence and injustice, the cities prospered in their trade, and enjoyed great respect among their neighbours. (Froissart, *Chroniques de la France*; Myer, *Annales Rerum Flandricarum*; Oudegherst, *Chroniques et Annales de Flandre*.)

ARTEVELD, PHILIP VAN, the son of Jacob Arteveld, was born about 1340. Philippa, Edward III.'s queen, held him at the baptismal font, and from her he received his Christian name. His father left him wealth, and his mother, a woman of a prudent character, watched over his youth. She negotiated an early marriage for him with a lady of good family, after which Philip lived quiet and happy with his wife and mother, keeping aloof from all public affairs. But he had a name which was connected with party feelings and recollections. A fresh revolt broke out at Ghent in 1379 against Count Louis de Male, the son and successor of Count Louis I., in opposing which the count succeeded in intercepting all supplies to the insurgent city, which was reduced to great distress. Piet van der Bosch (the Pierre Dubois of the French), and the other leaders of the Ghentese, finding that the people were impatient of their assumed authority, thought of strengthening themselves by engaging Arteveld as the nominal chief of their party. They proposed him to the people, and he was elected captain by acclamation. After some desultory negotiations with the count, in the course of which two deputies of Ghent who had proposed to surrender the town, were stabbed in the market-place by Van der Bosch, Arteveld, seeing that it was impossible to hold out any longer for want of provisions, conceived the bold resolution of marching out with a chosen body of men and attacking the count, who was then at Bruges. He left Ghent on the 2nd of May, 1382, with 6000 men, determined to conquer or die, and halted in a good position, within three miles of Bruges. The next day was a great festival in that city. In the midst of the processions and rejoicings, news came of the Ghentese being at hand. The count went out to encounter them with a body of 800 knights and squires, followed by a numerous but disorderly multitude of the people of Bruges. The result was disastrous for the count and his followers. He re-entered Bruges with only forty horsemen, and the Ghentese poured in at the same time. It was now night; and before the citizens of Bruges had time to recover from their panic, the city was given up to plunder. Arteveld succeeded in stopping the indiscriminate slaughter in the morning; but the magistrates and nobles were sought after and led to execution as traitors to their country. The commerce of Bruges was annihilated for a time by this catastrophe. The count succeeded in effecting his escape.

After the capture of Bruges, the other towns of Flanders, with the exception of Oudenarde, opened their gates to Arteveld. He now assumed the state and pomp of a sovereign prince, taxed at will the country people, but took care to keep the city of Ghent well supplied with provisions at a low price. His camp abounded not only with all necessaries, but also luxuries. He began the siege of Oudenarde, in which however he was unsuccessful. Meantime the people of the neighbouring states, Hainault, Brabant, Liege, &c. showed a disposition to make common cause with the Flemings, and the spirit of revolt spread also into France, where the people were dissatisfied with the exactions and oppressions of their nobles. The duke of Burgundy, regent of France, easily induced the young king, Charles VI., to assist Count Louis in putting down the Flemish insurgents, before the English had time to join them. A large force was collected under the command of Olivier de Clisson, a skilful but merciless commander; the oriflamme was displayed, and the campaign began in November, 1382. The French advanced to Roosebeke, between Courtray and Ghent. Arteveld rashly advanced to attack them; and on the 29th of November the armies met. The Flemings, equal in numbers, but inferior in military skill, were arrayed too closely, so that the greater part of them had not room to wield their weapons. The battle lasted only an hour, yet 25,000 Flemings were killed, most of them in the

pursuit. "The body of Arteveld," says Froissart, "being found under a heap of slain, was suspended on a tree."

(Barante, *Histoire des Ducs de Bourgogne de la Maison de Valois*.)

ARTHUR, king of Britain, the famous semi-fabulous hero of the period which intervened between the departure of the Romans from England and the settlement of the Saxon kings. So much of the story of Arthur as told by the monkish chroniclers and mediæval poets and romancers, is even so absurdly fictitious, that Arthur himself has long since been regarded by many writers (by Milton among others) as a mythical personage. But there appears to be no sufficient ground for such a supposition, and the Arthur of history is still to a certain extent separable from the Arthur of romance.

Following then as well as we can the historic traces of his career, it would seem that Arthur must have been born in the last quarter of the 5th century. He is described as the son of a British prince, but the name of his father does not occur in historic records. He began his warlike career about the commencement of the 6th century. Owen and Whitaker, who have drawn largely on their imaginations in picking out a continuous biography of Arthur, make him to have been elected pendragon or chief ruler of the British; but there is no evidence of any such election, though he appears at times to have been recognised as their military chief.

The early history of Arthur is placed in the north, and there all his earlier victories were achieved; but after he became the recognised chief of the British, all his exertions were devoted to stopping the progress of the Saxons, led by the active and successful Cerdic, in the south. He was commander-in-chief at the battle of Llŷnborrh, on the authority of Llywarch Hen, a well-known Welsh bard, who fought in that battle, and composed an elegy, still extant, on the death of his friend Geraint ap Erbin, who fell in it. Llywarch mentions elsewhere another battle, in which 'Arthur did not recede,' fought on the river Llawen. The next and the most important battle is that of Badon (commonly supposed to be Bath), the twelfth victory over the Saxons in the list of Nennius, corresponding to one mentioned also by Gildas and Bede, and others, though Arthur is not named by them. This battle checked the progress of Cerdic, and compelled him to content himself with those provinces along the south coast which he had already gained. From this time we hear no more of Arthur, until the revolt of his nephew, Modred, or Medrod, which led to the fatal battle of Camlan in Cornwall, in 542. Modred was slain, and Arthur, mortally wounded, was conveyed by sea to Glastonbury, where he died and was buried. A popular traditional belief was long entertained among the Britons that he was not dead, but had been carried off to be healed of his wounds in Fairy-land, and that he would re-appear to avenge his countrymen, and reinstate them in the sovereignty of Britain.

The Arthur of romance is a very different person. He is the son of Uther Pendragon by Igherna, wife of Gorlois, duke of Cornwall, and owed his birth to a magical device, by which Uther assumed the form of the lady's husband. He succeeded to his father when 16 years old, and immediately prosecuted hostilities against the Saxons in the north of England. He defeated them on the banks of the river Douglas, and again under the walls of Lincoln, and compelled them to quit England and abandon their booty, as the price of their safety. Breaking this agreement, they sailed round the island, and landed at Totness in Devonshire. Arthur hastened by forced marches to punish this new aggression, and routed them with immense slaughter at the great battle of Mount Badon, in which he slew 470 men with his good sword Caliburn and his lance Rou. Again he hastened with all speed to Scotland, to relieve Dunbarton (Alclud), besieged by the Scots and Pihts. Having done this, and pursued those barbarians into the fastnesses of Loch Lomond, where he fitted out a fleet and obliged them to surrender, he returned southward, kept his Christmas at York, and employed himself in destroying the Pagan temples of the Saxons and restoring the Christian churches. The following summer he conquered Ireland and Iceland, and then returned to Britain, where he spent twelve years in peace, having taken a wife, Guenevere or Guanhmara, the fairest woman in the island. We need not dwell on his foreign conquests of Norway and Gaul, which occupied ten years more. He then returned to England, and held a great festival at Caerleon in Monmouthshire, where he was solemnly crowned, a multitude of tributary kings attending him. Not long after the Romans demanded tribute, on which he collected a mighty army and passed into Gaul. There he defeated the Romans, and was preparing to cross the Alps, when he received intelligence of the revolt of Modred, who had allied himself with the Saxons, Scots, and Pihts. Arthur gained two victories, one on the coast of Kent and one near Winchester, and forced Modred to fly into Cornwall, where a third engagement, fatal to both, was fought on the river Camlan.

Such in brief, and omitting the more extravagant and absurd inventions, is the story told by Geoffry of Monmouth, and much later by Buchanan ('*Historia Scotica*'), and adopted, with a great deal of additional fiction, by the romancers. The reader will see how widely it differs from the particulars above related on earlier British authorities. The famous story of the Round Table, with the tournament of the Knights, belongs wholly to the later romancers. It is remarkable that in the Armorican tales, from which Geoffry professed to derive his information, we find more mention of the Pihts, Scots,

and Irish, than of the Saxons; more traces of Arthur's presence in the north than in the south of the island, though the southern districts may be supposed to have been most familiar to the Breton bards. This is also noticeable in the romances founded on those tales, 'Merlin,' 'Morte Arthur,' 'Lancelot,' and others. The fabulous history of Arthur long retained its popularity in France, as well as in England, and was among the earliest books printed in both countries. A French version by Rusticien de Pise was printed at Rouen in 1488; and one of the Roman du Roi, entitled 'Livre du Vaillant et Preux Chevalier Arthur' appeared at Paris in 1493. The first English translation of the story printed was from the press of Caxton in 1485. A list of the principal romances about Arthur will be found in the Appendix to Sharon Turner's 'History of the Anglo-Saxons.' The work of Geoffry, and the earlier romances which relate to Arthur, are fully treated of in Warton's 'History of English Poetry,' vol. i.; Ellis's 'Specimens of Early English Metrical Romances,' and Dunlop's 'History of Fiction.' See also Whitaker, 'History of Manchester;' Owen, 'Cambrian Biography;' Ritson, 'Life of King Arthur;' and De la Villemarqué, 'Contes Populaires des Anciens Bretons.'

ARTIGAS, FERNANDO JOSÉ, descended from a respectable family, originally of Spain, was born at Monte Video, about the year 1760. He appears to have received little or no education; to have quitted his native town when very young, and to have joined the gauchos, or shepherds, for whose roving life he had conceived a very strong inclination. At the head of a band of the most resolute of these men he carried on the trade of a contrabandista, or smuggler, and every effort of the governor of Monte Video to put him down proved unavailing. At length, on the intercession of his father and family, the governor granted Artigas his pardon, and conferred on him the rank of captain in the corps of Blendingues, a kind of irregular light cavalry, which had been established with a view of checking the excesses of the gauchos.

Artigas remained faithful to his trust until the breaking out of the Revolution, when he placed himself again at the head of the gauchos, over whom his boldness, sagacity, and unrivalled skill in all athletic exercises had procured him unbounded influence. Having obtained from the revolutionists of Buenos Ayres arms and ammunition, he swept the country of the Spaniards, plundered their villages, and, uniting his forces with those of General José Rondeau, obtained several advantages over the regular troops, captured the towns of Minas, San Carlos, and Maldonado, and, in the month of May, 1811, gained a complete victory at Las Piedras over 1200 men of the army of Elio, the Spanish viceroy, with a far inferior force. In this action the general-in-chief of the Spanish forces fell into the hands of Artigas. Siege was now laid to Monte Video, but towards the end of the year the approach of the Portuguese led to a suspension of hostilities, which however recommenced in 1812. The siege of Monte Video was resumed, and Artigas, with his irregular forces, again co-operated with Rondeau. Disunion however soon took place between the two leaders. Artigas insisted upon directing the siege as chief of the provincials, Monte Video being situated in the Banda Oriental, while the general of Buenos Ayres, as commander of the auxiliaries, should act under his orders. By way of obviating this difficulty a member of the supreme government was appointed commander-in-chief. General Rondeau on his part convened an Oriental congress for the purpose of nominating deputies for a national congress, and appointing a provincial governor. Artigas could not brook this interference upon what he considered his own territory. As chief of the Banda Oriental, he commanded the electors, in the name of the general government, to receive their instructions from him at his head-quarters, and annulled the congress. The electors however assembled, the election of deputies and a governor was proclaimed with military pomp in all the encampments, and the governor began to exercise his functions. Artigas, deeply incensed, withdrew silently in the night with his men; and Posadas, the supreme director, issued a decree against him, by which he declared him infamous, deprived of his offices, and an outlaw. He further set a price upon his head of six thousand dollars. Artigas, when he left the camp before Monte Video, took with him about eight hundred men; as he advanced in the direction of the Entre Rios, the gaucho population flocked to his standard, and he soon found his forces increased to between two and three thousand. After several successes in the field, Artigas occupied Monte Video; invaded the province of Buenos Ayres; made himself master of Santa Fé; and compelled the junta to acknowledge him as independent chief of the Banda Oriental, to which dignity he added the title of Protector of Entre Rios and of Santa Fé.

In January 1815, Posadas resigned his office of supreme director, and was succeeded by Colonel Alvear, who after a succession of reverses, was deposed and banished. On the expulsion of Alvear, the proclamation against Artigas was publicly burnt by the cabildo, and overtures for a reconciliation made by the people of Buenos Ayres and Pueyrredon, the new director. They were at first well received by Artigas, but eventually proved fruitless. Towards the end of the year 1816 he was obliged to turn his attention towards the Banda Oriental, over which district he had long exercised absolute authority. The Brazilian government which had been called upon to interpose in order to put an end to the long protracted civil war, now despatched General Lecor with 10,000 men, to occupy the Banda Oriental. Artigas at

first repulsed the attack, and was on many occasions victorious; but the advantage, upon the whole, was on the side of the Brazilians, who, on the 20th of January, 1817, surprised Monte Video, and retained possession of it. In 1818 Artigas experienced still greater reverses, and was forced to treat with the general government. The news of the revolution in Spain caused a new outburst of hostilities in the La Plata provinces. The federalists turned to Artigas as their chief, and availed themselves of the excitement to gain over a great number of the officers and soldiers of Rondeau's army, who united themselves to that of Artigas, and then marched upon Buenos Ayres in order to complete the projected revolution. Pueyrredon and his party were compelled to fly, and Juan Pedro de Aguirre was named provisional governor in his place. But the centralists soon again made head, and the supreme power once more fell into the hands of the enemies of Artigas. He again took the field; but his career was now drawing to a close. Towards the end of the summer of 1820, a lieutenant named Ramirez, who was in command of a post in the Entre Rios, with 800 men, suddenly fell upon him, dispersed his troops, and seized on the government of the province. Artigas took refuge in the destroyed Misiones, with about one thousand followers; and soon after made a formal request of Francia, the Dictator of Paraguay, for an asylum for himself and his followers in that district. The request was complied with; but Francia, distrusting the men, dispersed them in various parts; while refusing an interview with Artigas, he assigned to the fallen chieftain a house with lands, with a pension, in the village of Curuguaty, eighty-five leagues north-east of Assumption. The governor of the circuit was ordered to treat him with respect, and to furnish him with whatever accommodation he might require. He cultivated his farm with his own hands—became the father of the poor of Curuguaty, distributing among them the greater part of his produce, and rendering all the assistance in his power to such as were disabled by sickness. In these acts of peace and benevolence he closed a life of violence, disorder, and political strife, in the commencement of 1826. Some writers have sought to elevate Artigas into a hero, and to attribute to him many of the qualities of a statesman as well as a general. But he was in truth just one of those bold unscrupulous semi-barbarous soldiers of fortune, who have been called into existence by the state of chronic hostility in which the Argentine provinces have for so many years unfortunately been struggling. He was perhaps one of the most skilful, and notwithstanding his original calling, one of the most honest. But he was essentially one of a class whose existence has been a constant blight on that fine but unhappy country.

(Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge*.)

ARUNDEL, THOMAS, Archbishop of Canterbury in the reigns of Richard II., Henry IV., and Henry V., was the second son of Richard Fitz-Alan, earl of Arundel, and was born at Arundel Castle in Sussex, in 1353. His high birth and powerful connections obtained for him, at a very early age, extraordinary preferments in the church. When scarcely of age he was archdeacon of Taunton; and before he had completed his twenty-second year, he was promoted to the see of Ely by the pope, who set aside the election of another bishop, whom the chapter had chosen. He was consecrated at Otford in Kent, April 6, 1375, but not installed at Ely until two years afterwards: he is believed to have been the youngest bishop ever consecrated in England. He was a liberal benefactor to the diocese of Ely, gave many rich presents to the church, and nearly rebuilt the episcopal palace in Holborn. In 1386, when Michael de la Pole, earl of Suffolk, was removed from the office of lord high chancellor by the pressing remonstrances of the Parliament, the seals were given to Arundel. In 1388 he was translated to the archbishopric of York by a papal bull. In the following year he resigned his office as chancellor, but was reappointed in 1391. In the execution of this office he incurred much unpopularity by the temporary removal of the courts of justice from London to York, on the plea of the turbulence of the inhabitants of London.

In 1396 Arundel was translated to the see of Canterbury, by the pope's provision—a proceeding at that time at variance with the statute law (of 1350). This was the first instance of a translation from the see of York to that of Canterbury. Soon after his promotion to the archiepiscopal see, Arundel accompanied King Richard to France to meet Charles VI. between Calais and Ardres; and there, on the 1st of November, 1396, he celebrated the king's marriage with Isabella, the daughter of the French king.

The king had been for a long time at variance with his uncle the Duke of Gloucester; and in 1397 he resolved to destroy him and the heads of his party. The blow fell severely upon the archbishop and upon his family. While the Duke of Gloucester was in confinement at Calais, the king seized the primate's brother, the Earl of Arundel, and sent him to Carisbrook Castle, in the Isle of Wight, whence he was removed to London, impeached of treason, and beheaded. On the 20th of September the primate himself was also impeached by the Commons of high treason. The charges preferred against him were, that he had aided the Duke of Gloucester and the earls of Arundel and Warwick, to obtain the commission of regency in 1386, and procured himself to be named one of the number; that he had advised the arrest and execution of Sir Simon Burley and Sir James Berners, contrary to the will of the king; and had committed these

crimes while he was chancellor, and bound by his oath to support the rights of the crown. He immediately rose in the House of Lords to defend himself against these charges, but was not suffered to proceed by the king, who, fearing the eloquence and weight of Arundel, pretended to desire more time to consider the matter, on account of the archbishop's dignity. Richard next persuaded him not to appear again in Parliament lest he should irritate his enemies, from whose resentment he promised to protect him. Arundel, relying upon the good faith of the king, did not attempt to vindicate himself in Parliament; and the impeachment seemed to be at rest, until the Duke of Gloucester's confession was made known, when the Commons prayed judgment against the primate. The king, so far from protecting him, now declared that he had already acknowledged his guilt, and had thrown himself upon the royal mercy; upon which sentence was pronounced, that he should be banished for life, that his temporalities should be forfeited to the crown, and that he should leave the country within forty days, on pain of death.

After a short retirement in France, Arundel proceeded to Rome, where Pope Boniface IX. entertained him with much kindness, and endeavoured, but in vain, to restore him to the king's favour. Arundel subsequently settled at Cologne; but soon left his retirement to take a leading part in the approaching revolution in his own country. Henry of Bolingbroke, duke of Lancaster, was then in banishment, and the despotic conduct of King Richard led a strong party of the nobility and people to look to Henry for their deliverance. The leaders of this party drew up a letter to Henry, and entrusted its presentation to Arundel, who secretly left his house at Cologne, and, travelling to Paris in the disguise of a friar, obtained an interview with Henry; and when Henry feigned to be scrupulous as to the lawfulness of the design, the learned churchman overpowered him with precedents of rebellion, in ancient and modern times. His exertions were soon rewarded: Henry of Bolingbroke was seated on the throne, and Arundel restored to the see of Canterbury (1399). Of the thirty-three articles preferred against King Richard, two related to his treatment of Arundel, in reference to the charges made against him in Parliament, and the promises by which the king had induced the archbishop to abandon his defence, together with the king's subsequent promises, which were likewise broken.

When Henry laid claim to the crown in the House of Peers, Arundel led him to the throne, and pronounced a discourse, exalting the merits of Henry, and contrasting them with the faults of Richard. At the coronation of Henry IV., Arundel, as archbishop of Canterbury, placed the crown upon the head of the usurper, and sat on the right hand of his throne. The munificence of the primate, and his firm defence of the interests of the clergy, made him very popular with the clergy; and early in the new reign he had two opportunities of strengthening his claims to their affection. At York in 1402 by his courage and resolution, he saved his brethren from being despoiled by the soldiery, who had plotted together to seize upon the plate, equipages, and money of the clergy who accompanied the king. In 1404 the king held a parliament at Coventry, known as the *Parliamentum Indoctum*, or *Lack-Learning Parliament*, mainly for the purpose of raising money. At this parliament the Commons expressed their opinion that the king should seize the revenues of the church and appropriate them to the public service. The archbishop warmly defended the interests of the clergy, and ultimately obtained a promise from the king that the church should not be despoiled. Satisfied with the royal support, he again addressed the Commons, and denounced their 'execrable scheme' with such force, that they at length asked the archbishop's pardon, and acknowledged the injustice of their plan.

Arundel now found the doctrines of the church and its very existence threatened from another quarter. The Lollards, or followers of Wickliffe, had been increasing in numbers, influence, and daring for the last twenty years; publicly denouncing the church and the clergy, and appealing to the passions and the rapacity, as well as to the religious feelings, of the people. In 1382 Wickliffe had presented a petition to Parliament, praying "that the wants of the nation should be supplied from the incomes of delinquent clergymen, and the superfluous revenues of the church, which were in reality the patrimony of the poor;" and in 1395, after Wickliffe's death, his followers had laid another petition before Parliament, urging the same principles, and full of severe invectives against the clergy. The archbishop became alarmed, and charged the bishops and clergy at Oxford to root out the heresies of the new sect; and in 1408 resolved upon a personal visitation of that University. The University of Oxford, a stronghold of Wickliffe's doctrines, questioned the archbishop's right of visitation; and on approaching the city he was met by the principal members of the University, who courteously declined to acknowledge his jurisdiction. The question being referred to the king, was decided by Henry in favour of the archbishop. This decision, and the strong remonstrances of a convocation of the bishops and clergy in London, against the growth of heresy at Oxford, induced the University to submit: they admitted delegates from the archbishop, and asked pardon for their former contumacy. A committee of twelve persons was then appointed to examine the writings of Wickliffe and others; whose censures of the doctrines of the new sect were confirmed by the archbishop, and eventually by the pope. Arundel next established

an inquisition at Oxford to inquire into the opinions of persons suspected of heresy, and put in force the statute *De heretico comburendo*, which had been passed at the beginning of the reign (2 Hen. IV. c. 15, Rot. Parl. iii. p. 463).

The translation of the Bible into the vulgar tongue had been one of Wickliffe's most powerful instruments of persuasion; and Arundel forbade, by synodical decree, the translation of the Scriptures into English, and the reading them when translated. The insurrection of the Lollards had in it some political as well as ecclesiastical elements, and in 1413, disturbances occurred of which the leading promoters were Lollards, headed by Sir John Oldcastle, the lord of Cobham. Oldcastle having disregarded the summons of the spiritual court to answer for his opinions, was finally seized by a military force, conducted to the Tower, and arraigned before the primate as a heretic. The conduct of the archbishop is described as being forbearing and mild, and in this respect to have contrasted favourably with that of the accused. Sir John persisted in his opinions, was pronounced an obstinate heretic, and delivered to the civil magistrate, "to be burnt on a high place before the people." After the sentence was pronounced, Arundel obtained from the king a respite of fifty days. Thus respited by the intercession of the primate, Sir John Oldcastle escaped from the Tower, and raised the rebellion which is associated with his name. Soon after the archbishop had pronounced sentence upon Oldcastle, he was attacked with an inflammation of the throat, of which he died on the 20th of February, 1413, o.s. He was buried in the cathedral of Canterbury under a monument erected by himself in his lifetime.

The character of Arundel was suited to the times in which he lived; he was bold, resolute, and active; possessed very considerable talents, was learned and virtuous enough to sustain his reputation as a churchman; and not more scrupulous or refined than a layman, in temporal affairs. He was an active politician in the midst of the intrigues and treasons of the reign of Richard, and foremost in the rebellion which cast that king from his throne. As a dignitary of the church he was liberal and princely: each see in succession held by him received ample marks of his munificence: he had scarcely rebuilt the London palace of the bishops of Ely when he commenced the building of a palace for the archbishops of York; and made several valuable offerings to the Minster. At Canterbury he built the Lanthorn Tower and part of the nave of the cathedral, and presented it with many rich gifts and endowments.

(Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge*.)

ASA, king of Judah, the third who reigned after the revolt of the ten tribes, and the fifth king of the dynasty of David, was the son and successor of Abijam or Abia. According to the chronology of Usher and Jahn, which corresponds with that given in the margin of our Bibles, Asa reigned from B.C. 955 to 914; but Hales dates his reign from B.C. 970 to 929. In the early part of his reign Asa was under the influence of his grandmother, Maacha, who encouraged the idolatrous practices which had prevailed during the reigns of his father and grandfather. But as soon as he took the government into his own hands he set about rooting out idolatry throughout the kingdom. After ten years of peace the land was invaded by Terah the Cushite, at the head of a very large army, which Asa met and utterly overthrew. In consequence of this victory, at the suggestion of the prophet Azariah, Asa and the whole of his people renewed their covenant with Jehovah. Asa was also for a long period engaged in hostilities with Baasha, king of Israel, who at length reduced him to considerable straits; but Asa having purchased the assistance of Benhadad, king of Damascus, Baasha was obliged to return to his own country, and Asa destroyed his strong fortresses of Ramah, and employed the materials in strengthening the towns of Geba and Mispheh. For seeking assistance from Benhadad he was severely rebuked by the prophet Hanani, whereupon the king seized the prophet and cast him into prison. The later years of his reign indeed appear to have been marked by many deeds of cruelty and oppression; and during these years he suffered much from disease. The history of Asa will be found in 1 Kings, xv. 9-24, and 2 Chronicles, xiv., xv., xvi.

ASCHAM, ROGER, was the third son of John and Margaret Ascham, and was born in the year 1515 at Kirby Wiske, near Northallerton, in Yorkshire, where his father resided as steward to the noble family of Scroope. His parents, who were highly esteemed in their station, after living together for forty-seven years, both died on the same day and nearly at the same hour. Their son Roger displayed from his childhood a taste for learning, and was received into the family of Sir Anthony Wingfield, who caused him to be educated with his own sons, and in the year 1530 placed him at St. John's College, Cambridge, then the most flourishing in the university. Ascham applied himself particularly to the study of Greek, to which a great impulse had recently been given by the dispersion of the learned Greeks throughout Europe in consequence of the taking of Constantinople. He made great proficiency in Greek as well as Latin, and he read Greek lectures while yet a youth to students still younger than himself. He took the degree of A. B. in February 1534, and on the 23rd of the next month was elected fellow of his college. He took the degree of A. M. in 1536, at the age of twenty-one; and began to take pupils, in whose instruction he was very successful. He also read Greek publicly in

the university, and privately in his own college. In 1544, on the resignation of Sir John Cheke, he was chosen University Orator, an office which he filled with general approbation.

In the following year (1545) appeared his 'Toxophilus, or the School of Shootinge,' a treatise on archery, which he composed with a double view: in the first place, to exhibit a specimen of English prose composition in a purer taste than then prevailed; and in the second, to attract the attention of king Henry VIII., then on the point of setting out on his Boulogne expedition, and to obtain the means of visiting Italy, which he much desired. He succeeded perfectly in the first object, and partially in the second; for the king was so well pleased that he settled on the author a pension of 10*l.* per annum, at that time a considerable sum, especially to a poor scholar. Ascham about this time acquired other great patrons. He enjoyed a pension from Archbishop Lee, acted for some time as tutor to Henry and Charles Brandon, the two sons of the Duchess of Suffolk, and attracted the friendly regards of the Chancellor Wriothesley, and other eminent men.

In 1548, on occasion of the death of William Grindal, who had been his pupil at Cambridge, Ascham was appointed instructor in the learned languages to the Lady Elizabeth, afterwards queen, a situation which he filled for some time with great credit to himself and satisfaction to his pupil. At the end of two years however, upon a disgust he felt at the conduct of some of the princess's attendants, he suddenly threw up his appointment, and retired to his college. He afterwards had reason to regret the precipitancy of his conduct, which was perhaps never entirely forgotten, though he succeeded in a great measure in regaining the favour of Elizabeth.

In 1550, while on a visit to his friends in Yorkshire, he was recalled to court by a letter informing him that he had been appointed to accompany Sir Richard Morysine on his embassy to the court of the Emperor Charles V. It was on his way to London on this occasion that he had his well-known interview with Lady Jane Grey, at her father's seat at Broadgate in Leicestershire, where, according to his beautiful relation of the scene in his 'Schole-Master,' he found her, a young lady of fifteen, reading the 'Phædon' of Plato in the original Greek, while the members of her family were hunting in the park. Ascham embarked for Germany in the following September. He accompanied Morysine as a kind of secretary, though some of his duties resembled those of a tutor. His spare hours he occupied in preparing a 'Report on the Affairs of Germany,' which was subsequently printed. During his absence abroad his friends in England procured not only the restoration of his pension, which had ceased at the death of Henry VIII., but the place of Latin secretary to Edward VI. For these favours he was indebted, as appears by a letter of Ascham preserved in the Lansdowne Manuscripts, to the interference of Sir William Cecil, the ambassador Morysine, and Sir John Cheke.

The death of king Edward in 1553 led to the immediate recall of the ambassador, with whom Ascham returned to England. By this event he lost both his recent preferments, and the accession of a Roman Catholic queen held out such dismal prospects for a zealous Protestant like Ascham, that he retired to his college almost in despair. Matters however took an unexpected turn. Sir William Paget, whose recommendation of the 'Toxophilus' to King Henry had procured his pension from that monarch, now exerted his influence in his favour with Gardiner, bishop of Winchester, who, notwithstanding Ascham's staunch Protestantism was often represented to him, proved his steady patron. The 'Toxophilus' was produced by the bishop at the council, and was considered so useful a work that the objections to the author's advancement were removed. Ascham's pension was not only restored, but doubled, and he was appointed Latin secretary to king Philip and the queen. By the influence of Gardiner he was also enabled to retain his fellowship and his post of public orator at the university.

On the death of Queen Mary in 1558 Ascham was soon distinguished by the notice of her successor. He was continued in office as Latin secretary, and made tutor in Greek to her majesty; and during the rest of his life was a constant resident at court. He spent some hours every day in reading Greek and Latin authors with the queen, and often enjoyed the more envied honour of being her partner or opponent in games of chance. He obtained from her several pieces of preferment, the principal of which was the prebend of Wetwang in the cathedral of York, which he received in 1559.

Ascham had long been subject to a hectic disorder, accompanied with want of sleep, and inability to study in the afternoon or evening; but at the end of 1568 he imprudently resumed the practice of night-study, in order to complete a poem which he intended to present to the Queen on new year's day. This brought on an attack of ague so severe as to cause his death, after only a week's illness, on the 30th of December, 1568. The news of his death caused universal regret, and Queen Elizabeth was so moved on hearing it, that she declared, most characteristically, that "she would rather have thrown ten thousand pounds into the sea than have lost her Ascham."

Ascham's greatest work, 'The Schole-Master,' did not appear until after his death, when it was published by his widow, with a dedication to Sir William Cecil. The principal object of the work, besides the reprehension of severity on the part of teachers and parents, is the introduction of a new system of teaching the Latin language—a

system which has been partially revived of late years. Ascham proposes, after teaching the rudiments of grammar, to commence a course of double translation, first from Latin into English, and shortly after from English into Latin, correcting the mistakes of the student, and leading to the formation of a classic style, by pointing out the differences between the re-translation and the original, and explaining their reasons. His whole system is built upon this principle of dispensing as much as possible with the details of grammar; and he supports his theory by a triumphant reference to its practical effects, especially as displayed in the case of Queen Elizabeth, whose well-known proficiency in Latin he declares to have been attained without any grammatical rules after the very simplest had been mastered.

Ascham was in correspondence with most of the learned men of his time, both in England and on the continent, especially with Sturmius, whose name he gave to one of his three sons. After his death a collection of his Latin letters was published by his friend Edward Grant, master of Westminster School, together with a few poems, for the benefit of Giles Ascham, who was then under Grant's tuition. To this collection was prefixed a panegyric on Ascham, which is the principal source for his life, though his letters, and numerous allusions scattered through his works, contribute to a knowledge of his personal history.

Most of Ascham's works have passed through several editions. The list includes:—1. 'Toxophilus; the Schole of Shootinge,' London, 1545, 4*to*. This edition, printed by Edward Whytechurch, is very scarce, and many bibliographers imagine a reprint by Marsh, 1571, to be the first edition. 2. 'A Report and Discourse, written by Roger Ascham, of the Affaires and State of Germany, and of the Emperor Charles his Court, during certain years while the sayd Roger was there,' London, fol., printed by John Daye. This work, which is in the form of a letter to a friend, contains many curious particulars, especially as to the personal appearance of Charles V. and his courtiers. It bears no date in the title-page, and, though written in 1552, was probably not published for some years after. 3. 'The Schole-Master; or Plain and Perfitte Way of teaching Children to Understand, Write, and Speake the Latin Tongue, but specially purposed for the private bringing up of Youth in Gentlemen and Noblemen's Houses,' London, 1571, fol. 4. 'Rogeri Aschami Familiarium Epistolarum Libri Tres,' &c., prefixed to which is Grant's 'Oratio de Vita et Obitu R.A., et ejus dictionis elegantia,' 12*mo*., London, 1576. The epistles have been several times reprinted. 5. 'Apologia pro Cœna Dominica contra Missam et ejus præstigias,' &c., 1577, 8*vo*. The English works of Ascham were reprinted in a collected form in 1 vol. 4*to*., in the year 1761, by Mr. J. Bennet, schoolmaster of Hoddesdon. A life of the author was appended, which bears in every line such strong marks of the hand of Dr. Johnson, that there can be no doubt as to its origin.

(Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge*.)

ASCLEPIADES. This name was common to a great number of persons, which has caused some confusion both in the ancient and modern accounts of Asclepiades the celebrated physician, of whom only we are going to treat.

Asclepiades was a native of Prusa in Bithynia, but the time of his birth is unknown, nor can we ascertain which of the three towns of Bithynia called Prusa claims the honour of his birth. He appears, when young, to have spent some time at Alexandria, and at Parium, on the Propontis; probably also at Athens, where, if the story told in Athenæus (iv. p. 168) refers to him, he gained his living at first by grinding at a mill during the night, in order that he might attend the lecturers on philosophy during the day. In Athens he appears to have been on terms of intimacy with Antiochus, the academician, the master of Cicero. He appears to have come to Rome about the beginning of the first century; he was there at least during the earlier part of Cicero's life, but he was probably some years older than the Roman orator. He is said to have in the first instance practised at Rome as a teacher of rhetoric, and not succeeding in that profession to have turned to the study of medicine. The date of his death is not recorded, but he is said to have lived to a great age, free from all disease, and to have died by accidentally falling down stairs.

The foundation of the healing system of Asclepiades was the doctrine of corpuscles, which he borrowed from Heraclides of Pontus. His corpuscular elements, which he called *δύκται*, differed from the atoms of Epicurus: they were without form, but still divisible, and subject to change. Disease, he argued, arose from inharmonious distribution of the corpuscles and obstructions of the pores. He seems to have been little acquainted with anatomy: he had no exact notion of the difference between the veins and arteries, he was unacquainted with the use of the nerves, and he confounded them with the ligaments. He is said to have been the first who divided diseases into acute and chronic, and to have considered them essentially different. He observed the double-tertian fever which was so common in Rome; and he distinguished very accurately between the violent or febrile droupy, and the chronic one, unaccompanied with fever.

The practice of Asclepiades was in many respects that of an empiric, but he was evidently a shrewd and observant man, and his mode of treatment was no doubt often beneficial. He trusted more to dietetic means than to the use of medicines; often recommended a change in the mode of living, in which he studiously attended to the most minute

particulars; disapproved of the frequent use of emetics and purges, but he pretty freely adopted the practice of bleeding. He ascribed great value to bathing and friction, and he rendered himself very popular with the Romans by his free use of wine in many complaints. Laughter, music, and singing he also considered as frequently efficacious in the cure of diseases. The few fragments of his writings which have come down to us have been collected and published by Gumpert in the work cited below.

ΑΣΚΛΗΠΙΑΔΗΣ.

The bust of Asclepiades is only presumed to be his on the ground of the name occurring upon it, and from the improbability of its belonging to any other less eminent person of the same name.

(Sprengel, *Versuch einer pragmatischen Geschichte der Arzneikunde*, 2nd ed., Halle, 1800, vol. ii. 6-27; and Asclepiadis Bithyni, *Fragmenta*, by Gumpert, Weimar, 1794; Chr. F. Harless, *Medicorum veterum, Asclepiades*, &c., Bonn, 1828; Bostock, *History of Medicine*.)

ASCONIUS, Q. PEDIANUS, one of the earliest commentators on Cicero, is believed to have been born at Padua about the commencement of the Christian era. From a passage in one of his commentaries ('Ad Orat. pro Scaur.', p. 176, ed. Lug. Bat.), he appears to have been employed on his work about A.D. 41, in the reign of Claudius. Philargyrius, quoted by Servius (Virg., 'Ecl.', iii. 106), states that he was in his youth the friend of Virgil; but he must have been a mere boy when the poet died, A.D. 19. He became blind in his seventy-third year, and survived the calamity twelve years. (Euseb., 'Chron. ad Olymp.' cxxiii. 3.)

Asconius was chiefly employed in the critical examination and illustration of the Roman writers. He was the author of a work which has been lost, directed against the calumniators of Virgil, and also of a life of Sallust ('Acron, ad Hor. Sat.', 1, 2); but there seems no reason to suppose that he was the author of the work 'Origo Gentis Romanæ,' usually ascribed to Aurelius Victor. The most important of his labours was his Commentary on the Orations of Cicero, which he wrote for the instruction of his sons ('Ad Orat. pro Mil.', 6). Of this work only fragments have been preserved, which, though in some of them much disfigured by the glosses of some ignorant grammarians, are still full of valuable information. We are indebted for the greater part of what we possess of Asconius to Poggio, the Florentine, who, during the Council of Constance, in 1416, happened to discover an old manuscript of it at the monastery of St. Gall, in Switzerland. It contained fragments of a commentary on nine orations:—Divin.; In Verrem, 3; Pro Corn.; In Tog. Cand.; Contra Pis.; Pro Scaur.; and Pro Mil. The general character of the commentary is, that it refers chiefly to historical, legal, and constitutional facts, and has preserved some curious information on various points, with which we should not otherwise have been acquainted. We may more particularly notice the speeches of Cæsar against Dolabella; of Brutus for Milo; of Luceius against Catiline; and of Cominius against Cornelius. The historians on whom he seems chiefly to depend for his information are Livy, Sallust, and Fenestella. The commentary on the orations against Verres is of so entirely different a character, both in style and matter, from that on the others, that it seems most probable, as Madvig conjectures, that it is the work of some later writer, who perhaps availed himself partly of the labours of Asconius. The first edition of Asconius was published, Ven., 1477; with the 'Scholia of Manutius,' Ven. 1547; by Haacke, Lugd. Bat., 1644.

(Fabric., *Bibl. Lat.*, 11, 6; Madvig, 'De Q. Asconii Pediani et aliorum veter. interp.' in *Cicer. Orat. Commentarius Disput. critic.* Havnise, 1828; Bahr., *Geschichte der Römischen Literatur*, Carlsruhe, 1832; Niebuhr, *Profat. ad Front.*, p. xxxiv., not. 4. ed. Berl.)

ASELLI (or, according to the custom formerly prevalent of Latinising the name, ASELLIUS), CASPAR, a physician who was born about 1580, at Ticino, or Cremona, and died in 1626. He became professor of anatomy at Pavia, but spent much of his time at Milan, where he effected the discovery which has preserved his name. In 1622, whilst dissecting a living dog, he for the first time observed the lacteals,

or the set of vessels which absorb or suck up the nutritious portion of the food of animals, that is, the chyle, from the upper part of the intestinal tube, in order to convey it to the heart and lungs, so that it may become incorporated in the circulating fluid or blood; distinguished them from the other vessels, and demonstrated them in his lectures; and from the white colour of the fluid they contained, named them *lacteals*. These observations were incidentally made by him in the course of dissections for other purposes; and he does not appear to have traced the lacteals accurately, but he recognised the importance of his discovery, and gave himself up during much of the remainder of his life to the elucidation of the real purpose of these vessels. The great value of the discovery was not generally admitted by the profession for half a century afterwards. Aselli drew up an account of his discovery, which was printed after his death. It is entitled 'De Lactibus; seu lacteis venis, quarto vasorum meseraicorum genere, novo invento, Dissertatio,' with figures of the vessels in three different colours, 4to, Milan, 1627, and has been several times reprinted. Aselli's death took place in 1626. He left a manuscript treatise on poisons, but it does not appear to have been published.

ASGILL, JOHN, a political and miscellaneous writer, was born about the middle of the 17th century. He was brought up to the law, and became a member of the society of Lincoln's Inn, where he recommended himself by his talents to the notice of Mr. Eyre, an eminent lawyer, and afterwards one of the judges of the Court of King's Bench, who assisted him in his studies. Asgill attained some eminence in his profession early in the reign of William III., when he began to display his humour and talents as a writer of pamphlets. Among the earliest works published by him were a pamphlet entitled 'Several Assertions proved, in order to create another Species of Money than Gold or Silver,' published in 1696, which proposes to employ securities on lands as a new circulating medium; and 'An Essay on a Registry for Titles of Lands,' which is said to have appeared first in 1688.

An Act of Parliament being passed in the year 1699 for the resumption of forfeited estates in Ireland, commissioners were appointed to settle claims, and as Asgill had become embarrassed in his circumstances, and had also become involved in difficulties as the executor of his eccentric friend Dr. Barebone, the builder of the new square in Lincoln's Inn, he determined to go to Ireland, where his merit and the favour of the commissioners procured him very extensive and lucrative practice, the whole country being engaged in law-suits, in the most important of which he was retained. He had married the daughter of Nicholas Browne, the attainted Viscount Kenmare, and he purchased of the crown, but avowedly as trustee for Lord Kenmare's infant son, his large estates in Ireland, and thereby acquired so much influence, that he obtained a seat in the Irish parliament for the borough of Enniscorthy. Prior to this time, however, he had published 'An Argument proving that, according to the Covenant of Eternal Life revealed in the Scriptures, Man may be translated from hence into that Eternal Life without passing through Death, although the humane Nature of Christ himself could not thus be translated till he had passed through Death,' 8vo, 1700; a pamphlet which, from its singular style, and the wildness of the author's ideas, occasioned an extraordinary sensation. Notwithstanding his repeated and solemn assurances of his belief in and respect for the Scriptures, the prevalent opinion occasioned by the appearance of this book was that he was an atheist, and it was alluded to by Dr. Sacheverell as one of the blasphemous writings which induced him to consider the church in danger. The clamour raised against the work was so great, that before Asgill could reach Dublin from Munster, to take his seat, the Irish House of Commons had ordered it to be burnt as a blasphemous libel, and, after he had sat four days, they expelled him on account of it. This expulsion took place on the 11th of October, 1703, yet a month later we find him petitioning the house to allow him to be heard in support of his title to the Castle Rosse estate, which had been impugned on behalf of Lord Kenmare's infant son. Asgill on this occasion successfully maintained his title, but some years later the claims of the Kenmare family were admitted. On his return to England, in 1705, Asgill was elected member of parliament for the borough of Bramber in Sussex, at which place he had obtained considerable interest as executor to Dr. Barebone. He sat in parliament until, in 1707, when, during an interval of privilege, he was arrested for debt, and committed to the Fleet, but was released by order of the House of Commons (December 16). Previous to this (November 25), his obnoxious treatise had been brought before the House, and a committee had been appointed to report upon it; and in consequence of their report, notwithstanding a spirited defence made by Asgill on resuming his place in the House, it was condemned to be burnt by the common hangman, as profane and blasphemous, and he was expelled from the House, on the 18th of December, 1707. After this event Asgill's affairs grew desperate, and he was compelled to remove to the Mint, after which he became a prisoner successively in the King's Bench and the Fleet, within the rules of one or other of which prisons he resided until his death, in November 1738, at the age of more than eighty, according to the memoir quoted in the 'Biographia Britannica,' which agrees also with the date of birth given above (which may however have been deduced from it), or about 160, according to a manuscript note in Sir W. Musgrave's 'Biographical Adver-

ria.' During this time he transacted professional business, and also published a great number of pamphlets, chiefly of a political character. Of the numerous pamphlets upon various political and theological subjects published by Asgill, many were of merely temporary interest. Several were in defence of the Hanoverian succession, and against the pretensions of the house of Stuart. Asgill also wrote some pamphlets on the public funds, and among his more miscellaneous pieces may be mentioned, 'Mr. Asgill's Defence on his Expulsion from the House of Commons of Great Britain in 1707,' 8vo, 1712, and one or two others defending his strange views on death; 'An Essay for the Press,' 1712; a pamphlet denouncing a proposed scheme for licensing and taxing the press; 'A Question upon Divorce,' 1717; 'A Short Essay on the Nature of the Kingdom of God within us,' 1718; 'The Computation of Advantages saved to the Publick by the South Sea Scheme, as published in the Moderator of Wednesday, the 26th of April, 1721, detected to be fallacious; with a Postscript,' 8vo, 1721. A list of these, with some curious particulars respecting Asgill, is given in 'Notes and Queries,' vol. vi., pp. 3 and 300. An interesting notice of Asgill, with copious extracts from his writings, will be found in Southey's 'Doctor.' The chief authority for the life of Asgill is the article by Dr. Campbell in the 'Biographia Britannica,' which is avowedly founded on 'A Manuscript by Mr. A. N.'

(*Biographical Dictionary of the Society for the Diffusion of Useful Knowledge.*)

ASHBURNHAM, JOHN, was the eldest son of Sir John Ashburnham, of Ashburnham, in Sussex, where the family had long been settled. Sir John died in 1620, after having run through all his estates, leaving his widow and children in a state of destitution. John, who, at his father's death was seventeen years of age, appears to have gone to court in attendance on the Duke of Buckingham, whose duchess was of the same family as Lady Ashburnham. In the year 1628, through Buckingham's influence, he was appointed groom of the bedchamber to King Charles I., to whom he was already so familiarly known that he both spoke and wrote of him as 'Jack Ashburnham.' In 1640 he was elected member of parliament for Hastings, and for some time he was an active member of the long parliament, and by his thorough support of the king, gave great offence to the majority of the House. In 1642 orders were given that he should be proceeded against for contempt of the summons of the House; on the 5th of February 1643 he was 'disabled' for being in the king's quarters; and in September of the same year an order was issued that his estate should be sequestered, which was carried into effect with so much rigour, that the petition of his wife for an allowance sufficient to educate their children was rejected. At this time Ashburnham was acting as treasurer and paymaster of the royal army. In 1644 he was one of the commissioners for the treaty of Uxbridge, and in 1645 one of the four commissioners named by the king to lay propositions for a peace before the parliament. He was employed also in many other missions of importance, and when the king determined to leave Oxford to join the Scots army before Newark, April 27, 1646, Ashburnham was his only attendant, with the exception of Dr. Hudson, whose local knowledge was indispensable for the journey. He attended Charles to Newcastle, but was compelled soon after to make a precipitate escape, in consequence of the parliament sending orders for his being arrested and carried to London. He fled to France, and joined the court of the queen; but in 1647, when a favourable turn in the king's affairs allowed him to do so, he resumed his attendance on his master. He had a principal share in the contrivance and execution of the king's escape from Hampton Court, November 11, 1647, and his surrender to Colonel Hammond, Governor of the Isle of Wight. The disastrous consequences of this measure led to much blame being thrown upon all who were concerned in it, but especially on Ashburnham, who was supposed to have suggested the surrender. He was even suspected of treachery, and a report was spread that he had received 40,000*l.* to deliver the king into the hands of his enemies. Those who did not credit this report, which indeed the whole tenor of his life belied, supposed that he had been deceived by Cromwell and Ireton, with whom he was in constant communication, as the king himself had been, during Charles's residence at Hampton Court. Ashburnham was so stung by the imputations on his honour, that in 1648 he printed 'A Letter to a Friend, concerning his deportment towards the King at Hampton Court and the Isle of Wight,' in which production he chiefly confined himself to a denial of the imputations upon his own character.

Ashburnham, who was confined by the parliament in Windsor Castle until he was released by an exchange of prisoners, remained in England after the death of the king, which led many royalists to give credence to the reports against him. He had however obtained leave of Charles II. to remain, as the only method of preserving the estates acquired by his second marriage with the dowager Lady Poulett, which took place in 1649, and he received no favour from the party in power. He was compelled to compound for his estate at the unusually high rate of half its value; was three times banished to Guernsey, and in 1654 committed to the Tower for transmitting money to the king; and was kept imprisoned until the death of Cromwell. At the Restoration he became groom of the bedchamber to the King Charles II., and received a grant of Ampthill and other parks in Bedfordshire for eighty years, as a reimbursement of various sums ex-

pended by him in the royal cause. He remained a familiar companion of Charles II. until his death, which took place in the year 1671, in his sixty-eighth year. He had repurchased the family estates which his father had dissipated, and which are still enjoyed by his descendants, now earls of Ashburnham: the first peer of the family was his grandson, who was called to the upper house by William and Mary.

Besides the 'Letter,' published in 1648, Ashburnham wrote a long justificatory narrative, which was handed about among his friends, after the Restoration, partly to counterbalance a similar paper which had been drawn up and circulated by Sir John Berkley, the other attendant on the king in his flight from Hampton Court, on whom suspicion had been thrown. Berkley's paper was printed before the close of the 17th century, but Ashburnham's, after serving its temporary purpose, remained in manuscript until the year 1830, when it was published by the late Earl of Ashburnham. It is entitled 'A Narrative, by John Ashburnham, of his attendance on King Charles I., from Oxford to the Scotch army, and from Hampton Court to the Isle of Wight, never before printed. To which is prefixed, a Vindication of his Character and Conduct from the Misrepresentations of Lord Clarendon.' The Narrative and Vindication together amply suffice to clear Ashburnham's character from the stain which had rested upon it in consequence of the doubtful manner in which Clarendon gave his opinion of his innocence.

A younger son of Sir John Ashburnham, Colonel WILLIAM ASHBURNHAM, was an active military commander for the king during the Civil Wars, and in 1644, when governor of Weymouth, defended the town for four months against the parliamentary army. He was afterwards imprisoned by Cromwell, on a charge of being concerned in a plot against his life. He died in 1679.

(*Biographical Dictionary of the Society for the Diffusion of Useful Knowledge.*)

ASHBURTON, ALEXANDER BARING, BARON, was born October 27, 1774, and was the second son of Sir Francis Baring, Bart., an eminent merchant in the city of London. He was removed from school at a rather early age, and placed in the mercantile establishment of his father. Having here completed his commercial training he was sent to the United States, where, and in Canada, he for some years conducted the American business of the firm. Here he acquired much of that wide and varied commercial knowledge, which, later in life, gave so much authority to his opinions on all matters connected with trade and commerce. In 1798 he married the daughter of William Bingham, Esq., Senator of the United States; and on the death of his father in 1810 he became the head of the great firm of Baring, Brothers, and Co.

Mr. Baring entered Parliament in 1812 as member for Taunton, which town he continued to represent till 1820, when he was returned for Callington, and remained its representative until it was disfranchised by the Reform Act. Prior to the introduction of the Reform Bill, Mr. Baring had voted steadily with the whig party; but he warmly opposed that measure, and in future ranked among the supporters of Sir Robert Peel. When Peel accepted office in December, 1834, he acknowledged the advantage which he had derived from the adhesion of his proselyte, by introducing Mr. Baring into his Cabinet as President of the Board of Trade and Master of the Mint. The appointment was a popular one, especially in the City and with the House of Commons, where Mr. Baring had long been regarded as a high authority on all commercial subjects. But the ministry had but a short tenure of office. Peel resigned in April, 1835, and the President of the Board of Trade of course went out with him—having however first been created Baron Ashburton. When Sir Robert Peel returned to office, September 1841, the differences of the United States respecting the boundary question excited some anxiety, and Peel requested Lord Ashburton to proceed to America as special commissioner, with powers to conclude a definite treaty. Both in England and America the nomination was received with satisfaction; and Lord Ashburton conducted the negotiations in so conciliatory a spirit, that Sir Robert Peel was able at the opening of the session of 1843 to announce that a treaty had been concluded with the United States, in which "the adjustment of the boundary question was far more favourable to this country than the award of the King of the Netherlands," and that the other points under discussion between the two governments had been arranged in an equally satisfactory manner. In the House of Lords, Lord Ashburton continued to support the policy of Sir Robert Peel until that statesman brought forward his bill for the repeal of the duties on the importation of corn, when he gave to that measure a resolute opposition. After it became law he took little part in politics. He died May 13, 1848, and was succeeded in the title by his son the present peer. Lord Ashburton cannot be termed a statesman in the proper acceptation of the term. But he brought to the consideration of political questions a clear calm business-like understanding and considerable experience, and though far from an eloquent speaker, his extensive knowledge and unquestioned probity, as well as his high mercantile standing, caused him in his place as a member of either branch of the legislature to be always listened to with respect. As a public man he will be remembered in connection with the treaty which is usually called by his name. Lord Ashburton was also well known as a liberal patron of arts and artists, not neglecting while forming a valuable collection of pictures by ancient masters to employ

living painters. He held the office of trustee of both the National Gallery and British Museum.

(*Gentleman's Magazine* for 1848.)

ASHMOLE, ELIAS, an eminent antiquary and herald, was born at Lichfield, May 23rd, 1617, and was placed at an early age as a chorister in the cathedral of Lichfield. He was afterwards taken into the family of James Paget, Esq., one of the puisne barons of the Exchequer, who had married his mother's sister. At the age of 16 he commenced the study of the law; and in 1638 he married Eleanor, daughter of Peter Mainwaring, of Smallwood in Cheshire, about which time he was admitted to practice as a solicitor in Chancery. In February 1641 he was sworn an attorney of the Common Pleas. He lost his wife on the 5th of December the same year. A royalist in principle, he became in 1645 one of the gentlemen of the ordnance in the garrison at Oxford, whence he removed to Worcester, where he was first a commissioner, and afterwards receiver and registrar of the excise. He became soon after a captain in Lord Ashley's regiment, and comptroller of the ordnance. In the midst of these employments he entered himself of Brasenose College, Oxford, where he applied himself with great vigour to the study of natural philosophy, mathematics, and astronomy, and where his acquaintance with Mr. (afterwards Sir George) Wharton led him to devote himself to the mysteries of astrology.

In July 1646 Mr. Ashmole withdrew again for a few months to Cheshire; but, coming to London, he fell in with Mr. (afterwards Sir Jonas) Moore, Mr. William Lilly, and Mr. John Booker, esteemed the greatest astrologers of their time, and was by them caressed, instructed, and admitted into their fraternity. In 1649 he married his second wife, the Lady Mainwaring (widow of Sir Thomas Mainwaring, Knight, recorder of Reading), whose second son by a former husband, Mr. Humphrey Stafford, made great opposition to the match. The large fortune which he obtained with this lady (he was her fourth husband, and much her junior in years) enabled him to open his house to the learned and scientific persons, and especially to the many astrologers who flourished in that time. In 1650 he published in 12mo a treatise written by Dr. Arthur Dee upon the philosopher's stone, under the title of 'Fasciculus Chemicus; whereunto is added, the Arcanum, or Grand Secret of Hermetick Philosophy. Both made English by James Hasolle, Esq.,' in which name the letters of his own will be found transposed. He at the same time undertook to make a complete collection of the works of such English chemists as had till then remained in manuscript. He likewise employed a part of his time in acquiring certain manual arts, such as engraving seals, casting in sand, and the craft of a goldsmith. In 1652, believing that a competent knowledge of Hebrew was necessary for understanding and explaining such authors as had written on the hermetic science, he applied himself to the study of that language. At length, towards the close of 1652, his 'Theatrum Chymicum Britannicum' appeared, a quarto volume, containing many pieces of our old hermetic philosophers. This work gained him a high reputation, and among other scholars to whom it extended his acquaintance was the celebrated John Selden, with whom he lived in intimate friendship till his death. Ashmole's marriage with the Lady Mainwaring, exclusive of mere family opposition, involved him in several lawsuits, and at last in one in Chancery with the lady herself. October 8th, 1657, he says, "The cause between me and my wife was heard, when Mr. Serjeant Maynard observed to the court that there were 800 sheets of depositions on my wife's part, and not one word proved against me of using her ill, nor ever giving her a bad or provoking word." The lady's suit was dismissed, and, notwithstanding the 800 sheets of depositions, Ashmole and his wife continued thenceforward to live together with all the usual appearances of harmony.

Ashmole now devoted himself to the study of antiquity and records. This recommended him to Mr. (afterwards Sir William) Dugdale, whom he accompanied about this time when making his survey of the Fens. In 1658 he published a treatise on the philosopher's stone, entitled 'The Way to Bliss; in three books,' 4to; a work in which he took leave of his friends the astrologers and alchemists. He had throughout life been a diligent collector of rarities, and somehow induced the younger Tradescant and his wife in 1659 to make over to him, by deed of gift, the remarkable museum of curiosities at South Lambeth, which the two Tradescants, father and son, had been long accumulating. The deed remained in Mrs. Tradescant's hands, and after her husband's death Ashmole instituted a suit in Chancery to compel the widow to transfer the collection to him. Mrs. Tradescant replied to the bill, denying that such a conveyance had ever been executed, and cited her husband's will, of a later date than the alleged conveyance, in which the collection of rarities is left to her during life, with power to bequeath it to Oxford or Cambridge university. The lord chancellor (Clarendon) however gave judgment in favour of Ashmole, and the widow was of course compelled to submit.

Upon the Restoration, King Charles II. bestowed upon him (June 18, 1660) the place of Windsor herald, and a few days after appointed him to make a description of the royal collection of medals. On November 2, 1660, he was called to the bar in the Middle Temple hall; and in January, 1661, admitted F.R.S. Soon after this time he had several new preferments bestowed upon him, and amongst them, by warrant, February 9, 1661, the secretaryship of Surinam. His

second wife, Lady Mainwaring, dying in April 1668, Ashmole married in the following November Elizabeth, the daughter of his friend Sir William Dugdale. A wealthy and prosperous man, he was now courted and esteemed by the greatest persons in the kingdom; and having finished his labours upon the 'History of the Order of the Garter,' presented that work to the king, May 8, 1672, who, as a mark of approbation for his toil and research, presented him with a privy seal for 400*l.* In 1675 he resigned his office of Windsor herald; and in 1677, on Sir Edward Walker's death, might have been made garter king of arms, but waived the appointment in favour of his father-in-law, Sir William Dugdale. On the 26th of January 1679, a fire broke out in the Middle Temple, in a set of chambers next to those in which Mr. Ashmole resided, by which he lost the greater part of his library, a cabinet of ancient and modern coins, and a great collection of seals, charters, and other antiquities. His manuscripts however, and his gold medals, were fortunately preserved, by being in the house which had been Tradescant's at Lambeth.

In 1682, the University of Oxford having finished a building as a repository for curiosities near the theatre, Ashmole sent thither the collection of rarities which he had received from the Tradescants (first however carefully removing everything that was likely to connect their name with the museum), and with it the valuable additions he had himself made to the collection. He afterwards added the donation of his manuscripts and library. This is still called the Ashmolean Museum. In 1686, on the death of his father-in-law, Sir William Dugdale, he declined a second time the office of garter, which he would have obtained for his brother-in-law, John Dugdale, but was unsuccessful. He however procured for him the place of norroy king of arms. This was one of the last public acts of Ashmole's life. He died May 13, 1692, and was interred at Lambeth.

Besides the works already noticed, which were published during his life, Ashmole left large collections in manuscript. Of these the two following, which are the most important, have been published:—'The Arms, Epitaphs, Fenestral Inscriptions, with the Draughts of the Tombs, &c., in all the Churches in Berkshire,' penned in 1666, were in part published afterwards under the title of 'The Antiquities of Berkshire,' 3 vols. 8vo, 1717, 1723, and at Reading in folio, 1736; and the diary of his life, which was first published in 12mo. in 1717, under the title of 'Memoirs of the Life of the Learned Antiquary, Elias Ashmole, Esq., drawn up by himself by way of Diary, with an Appendix of Original Letters;' published by Charles Burman, Esq.; reprinted with Lilly's 'History of his Life and Times,' 8vo, London, 1774. It is from this diary, abounding in absurd and puerile memoranda, but affording equally abundant evidence of his shrewd regard to his own interests, that the dates and facts in the preceding memoir have been principally taken.

ASHMUN, JEHUDI, was born at Champlain, in the state of New York, in the year 1794. He was the third of ten children of his father, a farmer, who had settled at Champlain when the neighbourhood was a comparative wilderness. He early displayed a fondness for books, and at the age of fourteen commenced preparing for college. Four years afterwards he became a student at Middlebury College, where he supported himself by teaching a school. In the interim he had acted as clerk to an attorney, or in any capacity which afforded a subsistence for the moment. He originally destined himself for the Christian ministry, but at different times studied both law and medicine. He removed to the university of Vermont, at Burlington, where he graduated with distinction. At the age of twenty-two he became the principal of a theological seminary at Hampden, in the state of Maine, called 'The Maine Charity-School,' and subsequently acted as classical professor. He was married at New York on October 7th, 1818, to Miss Gray, but having promised marriage to another, his conduct was regarded in so unfavourable a light in Maine, that he was compelled to quit the state. He went to Baltimore, and after vainly endeavouring to establish a superior seminary for girls, set up a periodical called 'The Constellation,' which failed, leaving him deeply in debt. He then removed to Washington, and after a time obtained the editorship of 'The Repository,' a monthly magazine, established under the auspices of the clergy of the Episcopal Church, whose communion he joined on the occasion. In this work he wrote much in favour of the plan of the 'African Colonisation Society,' for founding a settlement of liberated negroes on the west coast of Africa, and for a short time his periodical was entirely devoted to the subject. In 1821 he also published a 'Life of the Rev. Samuel Bacon,' who had fallen a victim in the original attempt to set the colony on foot. This publication entailed a heavy loss on the author, already deeply involved on other accounts. The desire to set himself free by the profits of commercial speculation, determined him to undertake a voyage to the coast of Africa. He obtained also an appointment as one of their agents from the African Colonisation Society. He landed at Cape Mesurado, with a detachment of freed negroes from Baltimore, in August, 1822, and finding the other agents had previously left the coast, he assumed all the authority belonging to the sole representative of the Society. From that moment his life was devoted to one object, the prosperity of the infant colony.

At the time of his arrival, the whole population, the late arrivals included, amounted to 130 persons, of whom 35 only were capable of bearing arms. Ashmun instantly set about building and fortifying,

without at the same time forgetting to make arrangements for instructing the colonists, and even the surrounding natives, in the arts of civilisation. His progress was stopped by sickness, which attacked all but two of the recent immigrants, and carried off Mrs. Ashmun on the 15th of September. The colony was also subjected to several hostile attacks from surrounding tribes, which Ashmun was able successfully to resist, inflicting at the same time great loss upon the assailants. From that time the colony was left in peace, and Ashmun devoted himself entirely to the civil interests of the settlement. Although retarded by frequent illness, which proved so fatal to others that on seven different occasions he was the only white man left in the colony, and although harassed by a misunderstanding with his principals at home, he had the satisfaction to see it making rapid progress. By the end of 1826 he had established a complete system of law; had founded new settlements inland, as well as on the coast; had erected two churches, besides a variety of other public buildings at the capital, Monrovia; had built a colonial schooner; had set up a printing-press, and opened a public library consisting of 1200 volumes. The population had increased during his administration to upwards of a thousand, and a considerable trade had sprung up.

Ashmun's constitution, which had been impaired even in his college days by severe study and frequent preaching, was completely destroyed by the climate of Africa and his never-ceasing exertions. In the midst of his arduous duties, having still some idea of entering the legal profession, he spent four hours each day in the study of Blackstone's 'Commentaries,' besides going through a great amount of miscellaneous reading. His only relaxation consisted in a voyage to the Cape de Verd Islands, in 1823, which greatly recruited his health. His departure for his native land became at length a matter of necessity, and on the 25th of March, 1828, he left the colony, then recently named Liberia, in the brig 'Dorria.' After touching at the island of St. Bartholomew, the brig reached Newhaven, Connecticut, in July. Ashmun landed in a state of great exhaustion, revived for a few days, relapsed, and then expired on the 28th of August, 1828, in his thirty-fifth year. His remains were honoured with a public funeral. A memoir of his life, by R. R. Gurley, a fellow-labourer in the cause of Liberia, appeared at Washington in 1835, in 1 vol. 8vo, with a portrait.

(Abridged from the *Biographical Dictionary of the Useful Knowledge Society*.)

ASKEW, ANNE, or *Ascough*, the second daughter of Sir William Askew of Kelsey, in Lincolnshire, has obtained mention in most histories of England as one of those sufferers who, before the final completion of the Reformation, abjured in part the doctrines of the Romish Church. She was more highly educated than was ordinary in that day, and by study of the Scriptures became a convert to the opinions of the reformers, at which her husband, one Kyme, a violent papist, was so much displeased that he turned her out of doors. She came up to sue for a separation, and although she did not obtain a legal divorce, she refused to return to her husband, and resumed her maiden name. She was arrested in March 1545, and accused of holding heretical doctrines concerning the sacrament, and denying the corporal presence of Christ's body in the elements after consecration; and on this charge she was committed to prison. Being examined before the chancellor, the bishop of London, and others, she is said to have replied boldly to the lord mayor's question, "Whether the priests cannot make the body of Christ?" "I have read that God made man, but that man can make God I never yet read." (Strype, 'Memorials,' i. p. 387.) Bishop Bonner was anxious to persuade her to recant, but her admissions were not satisfactory, or at least not effectual, for she was soon after again examined closely as to her belief and doctrines, and committed to Newgate. While there she was again strictly questioned as to what ladies at court had shown her favour and encouragement. Not being able to extract any information on this point, she was placed on the rack and cruelly tortured; and in a narrative drawn up by herself she states that, because she did not answer, "my lord chancellor (Wriothesley) and Master Rich took pains to rack me with their own hands till I was nigh dead." But her patience and fortitude could not be shaken, nor does it appear that she had any disclosures to make. She was burnt with four others at the stake in Smithfield, July 16, 1546. (*The First Examination of Anne Askewe, lately Martyred in Smythfelde by the Romish Popes Upholders, with the Eucydacion of Johan Bale; the Lattre Examination, &c.*; Fuller, *Church History*, book iv.; Fox, *Book of Martyrs*.)

ASMONÆANS. The Asmonæan family derived their name from Asmonæus, a Levite of the class Jojarib, who has been supposed to have been contemporary with the immediate successors of Alexander the Great. The son of Asmonæus was Symeon, or Simon, whose son Johannes was the father of Mattathias, the father of the Maccabees. The name Asmonæus, or Asmonæus, had probably, like other Hebrew names, a significative meaning; the word Chahsmanim occurs only once in the Old Testament, in Psalm lxxviii. 32. It there means 'fat ones'; that is, rich noblemen, princes; hence the designation Asmonæans implies nobles or princes emphatically so called.

The Jews, while subjected to the Seleucids, or Greek kings of Syria, depended upon the priests as the organ of every interest, and the high-priest in Jerusalem was the head of the nation. The Jews had for many years been subject to the arbitrary rule and cruelty of the Syrian

kings, when Mattathias and his five heroic sons, John, Simon, Judas, Eleazar, and Jonathan, commenced their victorious resistance to the attempt of Antiochus Epiphanes to compel the Jews to exchange their ancestral monotheism for the idolatry of their Syro-Macedonian oppressors. This struggle is described in the books of the Maccabees, which are included among the books of the Apocrypha. It is also detailed in the 'Antiquities of Josephus,' from book xii, cap. 6, to the end of book xvi.

The power of the Asmonæan dynasty lasted from the year B.C. 166 to B.C. 37, but the family survived the dynasty. The first descendants of the Maccabees ruled without the title of king, but with sovereign power: they united in their persons the functions of the high-priest, the chief civil magistrate, and the chief commander of the army. The later Asmonæan monarchs adopted the title of king, but they lost, with the pious virtue of their ancestors, the love of the nation; and subsequently, by family discord, the kingdom itself.

After the death of Mattathias, Judas, at the head of those Jews who had fled into the wilderness, made war (B.C. 166) against Antiochus Epiphanes, overcame and killed Apollonius in battle, and thus became chief of his people. The next year he vanquished Lysias and Gorgias, two other generals of Antiochus; he then purified the temple, and restored the former worship. Antiochus, having heard of the defeat of his troops, swore that he would destroy the whole nation. As he was hastening to Jerusalem he died miserably, B.C. 164 or 165. Antiochus Eupator, his son, made peace with the Jews, but the war was soon renewed. Demetrius Soter, having put Antiochus to death, usurped his kingdom, B.C. 162, and conferred the high-priesthood on Alcimus. In a battle against Bacchides, one of the generals of Demetrius, Judas was killed. [JUDAS MACCABEUS.] Jonathan succeeded his brother, and after some years of commotion was made high-priest, B.C. 153.

Jonathan entered into an alliance, B.C. 150, with the usurper, Alexander-Balas, who pretended to be the son of Antiochus Epiphanes. Jonathan was afterwards killed by Tryphon, a professed supporter of the claims of Antiochus, the son of Alexander-Balas. [JONATHAN APPHUS.] Simon, B.C. 144, shook off the yoke of the kings of Syria, and took the city of Gaza and the fortress of Jerusalem. He made an alliance with Antiochus Sidetes; but it was soon after broken, and Antiochus sent Cendebeus against him. Simon, now too old to go to war, resigned the command to his sons, by whom Cendebeus was defeated. Ptolemæus, the son-in-law of Simon, aspiring to reign in his stead, invited his father and brothers-in-law to a feast, at which Simon and his sons were assassinated, B.C. 135. [SIMON MATHES.] John Hyrcanus, the third son of Simon, not being with him when he was murdered, escaped assassination. Ptolemæus now called Antiochus Sidetes to his assistance. They besieged Jerusalem, which being reduced to a state of famine, John was obliged to capitulate. John went afterwards with Antiochus in an expedition against the Parthians; and for his exploits against the Hyrcanians was surnamed Hyrcanus. [JOHN HYRCANUS.]

Aristobulus, the son of Hyrcanus, became high-priest after the death of his father. Hyrcanus bequeathed the sovereign authority to his wife, but Aristobulus caused her to be shut up; and, contrary to former custom, assumed both the diadem and regal title, B.C. 106. In an expedition against the Itureans, he was attacked by illness, and returned to Jerusalem, leaving his favourite brother Antigonus to finish the war. The wife of Aristobulus took advantage of the absence of Antigonus to weaken his influence with his brother; and she endeavoured to excite in her husband's mind the belief that Antigonus sought to obtain the royal dignity. Under her influence Aristobulus caused Antigonus to be murdered on his return from the Iturean campaign. He afterwards suffered great remorse for this deed, which aggravated his disorder, and he died at the close of the first year of his reign. Three of his brothers whom he had kept in prison were set at liberty on his death. The eldest, Alexander Jannæus, succeeded him in the royal title and office, B.C. 105. [ALEXANDER JANNÆUS.] Alexander Jannæus reigned twenty-seven years, and was succeeded by his wife Alexandra, B.C. 79. His son Hyrcanus became high-priest. Alexandra reigned nine years. Upon her death, B.C. 70, the government devolved upon Hyrcanus II, a prince of a weak character and inactive disposition, who was dispossessed of his regal authority by his brother Aristobulus, but permitted to retain the office of high-priest, with an ample revenue. Hyrcanus after some time, being assisted by Aretas, king of Arabia, attempted to resume his former rank. Aretas besieged Jerusalem, and Aristobulus was reduced to great straits; but having gained to his party Scarus, one of the lieutenants of Pompeus, Aretas was obliged to raise the siege and to return to defend his own dominions. Thus commenced the Roman power in Judæa. The authority of Aristobulus had not yet been sanctioned by the Romans; and on the appeal of Hyrcanus, Pompeus, having heard the arguments of both parties, decided in favour of Hyrcanus, whom he reinstated in the government under Roman protection. Aristobulus upon this shut himself up in Jerusalem. Pompeus besieged the city during three months; and took it at last by fixing his engines on the Sabbath. The Jews would not violate the sanctity of that day by offensive warfare, although they were ready to repel attacks: Pompeus accordingly issued strict orders that nothing having the semblance of attack should be suffered to occur, in order that the Jews might have no

pretext for disturbing his preparations. Aristobulus was carried to Rome, and made to appear in the triumphal procession which celebrated, among other victories, the Jewish conquest; but finding means to escape from Rome, he returned to Judæa, and excited fresh commotion. Gabinus, the Roman general, took him prisoner, and sent him a second time to Rome, where he died some time after from the effects of poison.

The government of Hyrcanus was disturbed by continual commotions, which he had not the ability to prevent. His minister Antipater, the Idumean, wrested from him all but the name of ruler. Antigonus, the son of Aristobulus, to revenge the death of his father, procured the assistance of the Parthians and took Hyrcanus prisoner. Hyrcanus was allowed to return to Jerusalem; but was put to death *B.C.* 30, at the age of eighty. On the death of Hyrcanus, Antigonus became king; but three years from the commencement of his reign, he was put to death by the Romans, *B.C.* 37, to make way for Herod. Herod had ingratiated himself so much with Julius Cæsar, M. Antony, and the Romans in general, that with their assistance he was enabled to supplant the Asmonæans, and to commence a new dynasty, *A.D.* 37. To confirm his authority, he married Mariamne, grand-daughter of Hyrcanus II., and made her brother Aristobulus III. high-priest, reserving to himself the regal power; but finding that Aristobulus retained many partisans, he caused him to be drowned, *B.C.* 35.

Mariamne, who was distinguished by her beauty and talents, was murdered by order of Herod on an unfounded suspicion of conspiracy and adultery. Her sons were also put to death on a charge of rebellious designs. But the Asmonæan family did not end entirely with their power, for we read in the commencement of the auto-biography of Fl. Josephus, "By my mother I am of the royal blood; for the children of Asamonæus, from whom that family was derived, had both the office of the high-priesthood and the dignity of a king for a long time together. I will accordingly set down my progenitors in order." After giving his genealogy, in order to silence some who had, he admits, denied his high descent, at length he says, "I have three sons—Hyrcanus, the eldest, was born in the fourth year of the reign of Vespasian; Justin in the seventh, and Agrippa in the ninth." These are the last traces of the Asmonæan family.

In the British Museum there is a number of Asmonæan coins, from which the following drawings are taken:—

Silver. British Museum.

Brass. British Museum.

(*The Five Books of the Maccabees, with Notes and Illustrations*, by Henry Cotton, D.C.L., Archdeacon of Cashel, Oxford, 1832. Two of these books belong to the Apocrypha, which are frequently annexed to the Old Testament. See Josephus, *Antiq.* xii. 6—xvi. end; Franc. Perez Bayer, *De Numis Hebræo-Samaritanis*, Valentis, 1781, p. 181. folio; Franc. Perez Bayer, *Vindicia Numorum Hebræo-Samaritanorum*, 1790, folio; Spanheimii *Dissertationes de Præstantia et Usu Numismatum*, London, 1706, vol. i. p. 61, &c.)

ASPASIA, a native of Miletus, and the daughter of Axiochus, celebrated for her connection with Pericles. Of her early life nothing is known. She came to reside in Athens, and there gained the affections of Pericles. Having separated from his first wife with her own consent, he attached himself to Aspasia during the rest of his life; but marriage with a foreign woman was expressly forbidden by the law of Athens. There can be little doubt that she acquired great ascendancy over Pericles, though the extent and character of it have been much exaggerated. We are told little of her beauty; much of her mental powers and cultivation. Plutarch says that Pericles esteemed her "because she was a wise woman, and had great understanding in matters of government." Her house became a sort of centre of intellectual society, and it is said, that notwithstanding the seclusion in which Athenian matrons generally lived, many of them accompanied their husbands to enjoy her conversation. Socrates sometimes visited her in company with his friends. (Xen. 'Mem.' II. vi. 36; and the 'Menæxenus' of Plato.) The 'Menæxenus' is written to introduce a funeral oration ascribed to Aspasia, though the conclu-

sion of the dialogue seems to intimate that the author did not mean that ascription to be implicitly believed. Socrates however, as one of the speakers of the dialogue, gives Aspasia the high praise of "having made many good orators, and one eminent over all the Greeks, Pericles, the son of Xanthippus."

ASPASIA.

The connection of Pericles with Aspasia was a favourite subject of invective with his enemies. The comic writers especially treated her with great severity. One of them, Hermippus, prosecuted her on the charge of not believing in the gods, and also of being instrumental in debauching free women to gratify the lust of Pericles. And Plutarch, who relates the story, adds "that nothing but the personal exertions, the tears, and entreaties of Pericles procured her acquittal" ('Pericles,' c. 24). These stories, however unfavourable alike to Pericles and Aspasia, depend on the authority of late writers, as Plutarch and Athenæus: contemporary writers contain no hint of them, with the exception of the comic writers, whose trade was scandal. After the death of Pericles, Aspasia is said to have transferred her affections to Lysicles, a man of low origin, who however by her instructions, according to Plutarch, became for a time the popular leader in Athens. By Pericles Aspasia had a son, also named Pericles, who was legitimatised by a vote of the people.

ASSAROTTI, OTTA'VIO GIOVANNI BATTISTA, to whom Italy owes the institution of schools for the deaf and dumb, was born at Genoa on the 25th of October 1753. In 1771 he entered the fraternity of the 'Scuole Pie,' a society of regular ecclesiastics devoted to the instruction of the young, to whose care he owed his own instruction. His life was thenceforth spent in duties to which his profession invited him. His talents and learning were appreciated by his superiors. He taught successively, in the schools of his order, at Voghera, Savona, Albenga, and Genoa; he was appointed by the archbishop of Genoa to be examiner of the clergy in the diocese; and about the beginning of the present century he lectured on moral and dogmatic theology to the students in the seminary of the 'Scuole Pie.'

About the year 1801, Father Assarotti's attention was drawn to the labours of the Abbé Sicard in the education of deaf-mutes. For years he laboured almost unaided and alone at the self-imposed task of instructing such poor children of this class as his means allowed him to maintain, and at the same time of instructing himself in the means of imparting information to them. It was not till the 2nd December 1812 that Assarotti, with thirty pupils, was enabled to take possession of the college-buildings assigned to them, with an endowment by Napoleon I., in the ex-monastery Della Misericordia. On the fall of the French government, in 1814, the Deaf and Dumb College lost its endowment; but it retained possession of the buildings which had been allotted to it; and, after a suspension of four months, the endowment was restored. Three or four years afterwards the king of Sardinia bestowed on Father Assarotti himself a pension of 800 lire, and provided funds for maintaining eighteen deaf-mutes gratuitously in the house. Assarotti's benevolent designs were now placed beyond the risk of failure; and, although already fallen into premature decrepitude, he continued to devote himself to his philanthropic labours during the remainder of his life. He died at Genoa on the 24th of January 1829, in the seventy-sixth year of his age, having bequeathed to his pupils the remnant of his small fortune.

Assarotti's Italian biographer enumerates a series of departments of knowledge as having been taught by Assarotti in his later years, which, as he truly observes, it could hardly be believed possible to communicate to the unfortunate pupils. The list embraces the Latin and modern languages, ancient and modern history, geography, algebra, and geometry, the elements of astronomy, metaphysics and logic, and the principles of religion, with the arts of drawing and engraving. Several of Assarotti's pupils are named as having displayed a considerable degree of intelligence and knowledge. His scholar Taddei wrote a religious book for his fellow-sufferers; Migliorini became the teacher of a deaf and dumb school in Tuscany; and Castelli obtained a com-

mission in the corps of engineers. Teachers who had been trained under Assarotti were placed at the head of the schools in Turin, Milan, Pisa, Siena, and Parma. Deaf and dumb schools, it is only right to add, are now pretty general in the chief cities of Italy.

(Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge*.)

ASSEMANI, GIUSEPPE SIMONE, a learned Maronite, native of Syria, who came to Rome towards the beginning of the 18th century, was made Archbishop in *partibus* of Tyre, and keeper of the Vatican library, by Clemens XI. He died at Rome in 1768 in his eighty-first year. He was sent by Pope Clemens on a literary mission to Egypt and Syria in the years 1715-16, and he brought back to Rome many valuable manuscripts. He then set about compiling his 'Bibliotheca Orientalis Clementina Vaticana,' four volumes folio, Rome, 1719-28, being a biographical account of the Syrian writers, divided into three classes, that is, Orthodox, Jacobites, and Nestorians, with copious extracts in the Syriac text, and a Latin version, lists of their works, and comments on the same. He intended to proceed with the Arabian, Copt, and other eastern writers, but nothing appeared in print beyond the Syriac. The fourth volume of the 'Bibliotheca' is engrossed by a learned dissertation on the Syrian Nestorians. His other more important published works are:—'S. Ephraem Syri Opera omnia quæ extant,' six volumes folio, Rome, 1732-46. This edition of the works of St. Ephraem, one of the old Syrian fathers, was begun by Ambarach, another learned Maronite living at Rome, and better known as Father Benedetti, and after his death was completed by Assemani. 'Kalendaria Ecclesiæ Universæ, in quibus tum ex vetustis marmoribus, tum ex codicibus, tabulis, parietinis, pictis, scriptis, sculptivæ Sanctorum nomina, imagines et festi per annum dies, Ecclesiarum Orientis et Occidentis, præmissis unius cujusque Ecclesiæ originibus, recensentur, describuntur, et notis illustrantur,' six volumes quarto, Rome, 1755-57. This is an elaborate and curious work, which originated out of a request of the Marquis Capponi that Assemani would describe five pictures of saints of the Russo-Greek Church in his collection. Assemani undertook the task, wrote and published six large quarto volumes, yet left his work unfinished: he had prepared six more quarto volumes, but they were destroyed in a fire which burnt a large number of his manuscripts in 1768. The first four and part of the fifth of the published volumes are taken up with a learned history of the Slavonian Church. 'Bibliotheca Juris Orientalis Canonici et Civilis,' four volumes quarto, Rome, 1762-64. Some other of his writings were published, yet Vaccolini states that, besides the large number of his manuscripts burnt in the fire already referred to, there is still in the libraries of the Propaganda and the Inquisition at Rome enough in Assemani's handwriting to fill a hundred volumes.

ASSEMANI, SIMONE, the nephew or grand-nephew of Giuseppe Simone, was born in Syria in 1752. He studied at Rome, and having taken holy orders, spent some time in travelling in the East. Of this journey he gave what Meneghilli terms a truly oriental account. On his return to Italy he was employed to draw up a catalogue of the oriental manuscripts of Jacopo Nani. He afterwards became professor of oriental languages in the academy of Padua, and in 1807 was raised by Napoleon I. to a similar professorship in the university of that city, which post he held till his death, April 7, 1821. Assemani was regarded during his life, especially in Italy, as a great authority in Oriental literature. He published several works in Italian and in Latin on Arabian literature and history. Of these perhaps the more important are:—'Saggio sull'origine, culto, letteratura e costumi degli Arabi, avanti il pseudo profeta Maometto,' 8vo, Padua, 1787; 'Catalogo dei codici MSS. Orientali nella biblioteca Naniana,' 4to, Padua, 1787-88 (to this catalogue he added extracts from some of the more remarkable works registered in it); 'Globus Cælestis, Cufico-Arabicus,' 4to, Padua, 1790, being a description of the celestial globe in the Borgia Museum at Velletri, with a dissertation on the astronomy of the Arabs. It was Simone Assemani who first exposed the forgeries of the Maltese Vella, who pretended to have found an Arabic manuscript containing a diplomatic code of the Sicilian Saracens. Vella's imposture on further inquiry being made clear, he was sentenced to imprisonment. (*Cesarotti's Opere*, vol. xviii.; *Fundgruben des Orients*, vol. i.; *Allgemeinen Literarischen Anzeigen* for 1795; Sylvestre de Sacy, *Biographie Universelle—Supplement*; Moschini, *Biografia Universale*, the latter being a new life from original sources.)

ASSEMANI, STEFANO EVODIO, nephew of Giuseppe Assemani, was born at Tripoli about 1707. He studied at Rome, and returned to Syria as a missionary of the Propaganda. He was present at the Synod of Lebanon, 1736, at which his uncle acted as legate. Subsequently he spent some months in England. Having established himself at Rome, he was employed as assistant to his uncle at the Vatican; and on his uncle's death succeeded him as upper keeper of the library. He also became Bishop of Apamea. His literary reputation is not very high. The only works of any consequence which he published are the following:—'Bibliotheca Mediceo-Laurentianæ et Palatinæ Codicum MSS. Orientalium Catalogus,' two volumes folio, 1742, with notes by Gori; 'Acta Sanctorum Martyrum Orientalium et Occidentalium,' two volumes folio, Rome, 1748. To this work, which he compiled from manuscripts in the Vatican, he added the 'Acts of St. Simon,' called 'Stylite,' in Chaldaic and Latin. He also began a general catalogue of the Vatican manuscripts, divided into three classes,

Oriental, Greek and Latin, Italian and other modern languages, of which however he published only the first volume in 1756, a fire which broke out in his chambers having destroyed his papers. Mai has continued parts of this catalogue in his 'Scriptorum Veterum nova collectio.'

ASSER, or more correctly ASHI. Ashi was the principal author of the Babylonian Talmud, so called from the place of his residence. He was born at Babylon A.D. 353 (A.M. 4113), and appears to have been distinguished very early in life by intellectual powers and acquirements. His Jewish biographers indeed relate that he was appointed head of the College of Sori, in Babylon, at the age of fourteen; but it is scarcely necessary to discuss the probability of this unparalleled instance of mental precocity. He held this post till his death in 426. Rabbi Abraham-ben-Dior asserts, in his 'Kabbalah,' p. 63, that since the days of Rabbi Jehuda-Hannasi, or Rabbenu-Hakkadosh, in no one but Ashi had been combined at once knowledge of the law, piety, humility, and magnificence. His fame attracted to his lectures many thousands of students. The expositions of the Mishna which he delivered in his lectures were collected, and form the basis of the Babylonian Talmud. The continuation was the work of his disciples and followers: it was completed seventy-three years after the death of Ashi by R. José, president of the College of Pumbedita in Babylon. (Compare the *Tsemach David*, first part, in the years 4127 and 4187; *Sepher Juchasin*, fol. 117; *Halichoth Olam*, p. 18; Wolfii, *Bibliotheca Hebræa*, tom. i., p. 224.)

ASSER, or ASSERIUS MENEVENSIS, a learned monk of St. David's, whence (the name of that place in Latin being written Menapia, or Menevia) he obtained the appellation of Menevensis. Asser was invited to the court of Alfred the Great, as is generally believed, in or about the year 880, but probably earlier, merely from the reputation of his learning. King Alfred, according to his own statement in the 'Life of Alfred,' first wished him to reside constantly at court; but as Asser would not consent to this, the king then desired that he would apportion his time between the court and his monastery, passing six months at each. It was finally arranged, in accordance with a suggestion of his brother monks, that he should reside alternate quarters at court and at St. David's. The king was at a place called Leonaford when Asser entered on his new duties. Alfred received him with every mark of distinction, and he remained at court eight months, reading with him such books as the king possessed; and henceforward he was a pretty constant attendant at court, in the manner stipulated. Alfred bestowed several preferments upon Asser, including the church of Exeter. An Asser, bishop of Sherburne, is mentioned in the Saxon Chronicle, and he is generally identified with the author of the 'Life of Alfred,' though there are some difficulties in the way of connecting the references in other authorities. It is probable that he held some other see prior to that of Sherburne. In the epistle prefixed to Alfred's translation of Gregory's 'Pastorale,' addressed to Wulfsig, bishop of London, the king calls him 'my bishop,' acknowledging the help received from him and others in that translation. He is also named by king Alfred in his will as a person in whom he had particular confidence. Those very doubtful authorities, Matthew of Westminster and William of Malmesbury, make Asser, bishop of Sherburne, to have died during the life of Alfred, in 883; but the more nearly contemporaneous and trustworthy authority, the Saxon Chronicle, assigns his death to 910; and this is the date at which the decease of Asser Menevensis is usually fixed.

The work which gives Asser his claim to an important place among the early contributors to English history is the Latin 'Life of Alfred,' or, as it is entitled in the best edition, that of Wise (Oxford, 1722, one vol. 8vo), 'Annales Rerum Gestarum Ælfredi Magni.' This is the chief authority for the life of Alfred between the years 849 and 889, and it contains much important information relative to the condition of the country during that period. The work in its present state contains much contradictory matter, and much which is not reconcilable with other authorities, as well as much which is difficult to conceive could have been written by a person in Asser's position. But these things were generally regarded as corruptions and interpolations, and the substantial value of the 'Annals' remained unquestioned till 1842, when Mr. Thomas Wright, first in the 'Archæologia,' vol. xxix., and subsequently in his 'Biographia Britannica Litteraria' (Anglo-Saxon period), article 'Asser,' altogether impeached the authenticity of the whole biography; relying chiefly on the manifest contradictions in the account which Asser gives of himself, his statements respecting certain events, and the fact of the biography breaking off some years before Alfred's death, though Asser survived that monarch eight or nine years. The doubts of the genuineness of the 'Annals' excited much discussion. Mr. Wright's views have been formally and fully met by Lingard in his 'History of the Anglo-Saxon Church,' ii. 426, and by Dr. Pauli in the introduction to his 'Life of Alfred;' and every recent writer on our Anglo-Saxon history has referred at more or less length to the subject. We think it may be fairly stated that the opinion arrived at by the most competent authorities corresponds pretty nearly to that expressed by one of the highest, Mr. Kemble, in his valuable 'Saxons in England' (vol. ii., 42), "that there is no good reason to doubt the authenticity of Asser's 'Annals,' or to attribute them to any other period than the one at which they were professedly composed."

Bale and Pitts give the titles of six works ascribed to our Asser. One is of course 'The Life of Alfred;' the others are—1, 'A Commentary on Boethius,' but the existence of such a work is very doubtful; 2, 'Annales Britannia,' only known by its having been mentioned by Brompton; 3, 'Aurearum Sententiarum Enchiridion,' no doubt the sort of commonplace book mentioned in the 'Annals' as having been compiled for Alfred's use, and termed by him his 'Manual;' 4, 'A Book of Homilies;' and 5, 'A Volume of Letters.' The existence of the 'Homilies' and 'Letters' is however unsupported by any other authority.

AST, GEORG ANTON FRIEDRICH, an eminent German scholar, was born in 1778 at Gotha, at the gymnasium of which place and subsequently at the University of Jena he was educated. In 1802 he began his career as an academic lecturer in the University of Jena; and in 1805 he was appointed professor of ancient literature in the University of Landshut, where he remained until the transfer of that institution to Munich, in 1812. He spent the remainder of his life at Munich, where he died on the 30th of December, 1841.

Ast was one of the best and most industrious of modern scholars, and a very excellent teacher. During the latter period of his life, he devoted himself almost exclusively to the study of Plato, for the elucidation of whose works he had done more than any other scholar. His numerous works may be divided into two classes, philosophical and philological. Among the former we must notice especially his 'Hau-buch der Aesthetik,' Landshut, 1807, 8vo; 'Grundlinien der Philologie,' Landshut, 1808, 8vo, an excellent introduction to the study of antiquity; 'Grundlinien der Grammatik, Hermeneutik und Kritik,' Landshut, 1808, 8vo; 'Grundlinien der Philosophie,' 2nd edit., Landshut, 1825, 8vo; 'Hauptmomente der Geschichte der Philosophie,' München, 1829, 8vo; 'Platonis Leben und Schriften,' Leipzig, 1816, 8vo, a very useful introduction to the study of that philosopher. Among his philological works the chief is a complete edition of Plato's works (Leipzig, 1819-32), in 11 vols. 8vo, with a Latin translation, and a commentary which occupies the last two volumes. This work he followed by a 'Lexicon Platonium,' Leipzig, 1834-39, 3 vols. 8vo., which is one of the best special dictionaries that we have. In a critical point of view, his edition of Plato is greatly surpassed by some of the more recent editions of that philosopher.

ASTBURY, J., one of the great improvers in the manufacture of pottery in this country, was born about 1678; but we have no information as to his early history, or even as to his christian name.

Among the earliest improvers of this important branch of industry were two brothers of the name of Elers, who came to England from Nürnberg about 1690, and settled at Bradwell, near Burslem, in the Staffordshire Potteries, where they introduced a fine new red ware, and made many improvements in other branches of the art. Their operations were kept for some time strictly secret; but at length Astbury, by assuming the garb and manner of an idiot, obtained admission to the works, and employment in some mean capacity. He thus obtained free access to their machinery, and a full knowledge of their processes, and during a period of nearly two years he remained in the works, making models and memoranda during his intervals of absence. Having accomplished his purpose, he quitted the Elers' works and established himself at Shelton, in the Potteries, where he commenced the manufacture of red, white, and other wares, and introduced, for the first time, the use of Bideford pipeclay for lining culinary vessels, by which they were made very superior to those glazed with lead or salt. He likewise made numerous improvements, one of the most important of which was the use of calcined flint, which he had been accidentally led to try, from observing the ostler at an inn where he put up, burn a flint-stone till red-hot, then pulverise it, and blow the fine powder into the eyes of the horse. Astbury's attention was excited by the whiteness of the calcined flint, the ease with which it was pulverised, and the clayey nature which it assumed when moistened; and, reasoning upon these circumstances, he produced, by its employment, a very superior kind of ware. Astbury was eminently successful in his business, and succeeded in realising a considerable property by his improvements. He died in 1743, leaving a son Thomas, who also made some valuable improvements in pottery.

(Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge*.)

ASTELL, MARY, was the daughter of a merchant at Newcastle-upon-Tyne, where she was born about the year 1668. Her father gave her a good education, and an uncle, a clergyman of the Church of England, perceiving her aptitude for learning, instructed her himself in philosophy, mathematics, and logic, and to these acquisitions she afterwards added the Latin language. She removed to London about the time of the Revolution, and for the rest of her life resided either there or at Chelsea. She assiduously continued her studies, especially of the great writers of antiquity, and produced a considerable number of works, several of which attracted attention. She died on the 11th of May, 1731.

Mrs. Astell wrote a great number of religious and controversial works, of which the principal were as follows:—'A serious Proposal to the Ladies, for the advancement of their true and greatest interest,'

12mo., London, 1697. In this she proposes the establishment of a kind of college for the education of females, as well as for their retirement from the dangers of the world. The plan was highly admired by many, among others by Queen Anne, who manifested an intention of presenting 10,000*l.* towards the foundation of the college. Bishop Burnet however represented to her so strongly the great resemblance of the proposed establishment to a nunnery, that the queen gave up her intention, and the plan fell to the ground. Some of the writers in the 'Tatler' held up Mrs. Astell to derision, under the name of Madonella. 'Letters concerning the Love of God, between the Author of the Proposal to the Ladies and Mr. John Norris,' London, 1695, 8vo. Both Mrs. Astell and Mr. Norris were attacked by Lady Masham, in 'A Discourse concerning the Love of God,' for a great portion of which the authoress was said to have been indebted to the assistance of Locke. Mrs. Astell replied in 'The Christian Religion as professed by a Daughter of the Church of England,' 8vo, 1705. This is her most elaborate work, and whatever its defects, it was universally allowed that the work did great credit to the reasoning powers of the author. 'Reflections on Marriage,' 8vo., 1705. Besides these larger works, Mrs. Astell produced a number of controversial tracts.

(Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge*.)

ASTLE, THOMAS, was the son of Daniel Astle, keeper of Needwood Forest, and was born at Yoxall, in Staffordshire, in 1734. He was sent to the office of an attorney in his native town, but his taste inclining him to the study of general antiquities, he came to London; where, about the year 1763, he became known to Mr. Grenville, then First Lord of the Treasury and Chancellor of the Exchequer, and was employed by him in the arrangement of papers, and other business which required a knowledge of ancient hand-writing: in 1765 Mr. Grenville gave him the office of receiver-general on the civil list. Soon after this, Mr. Astle married the only daughter of the Reverend Philip Morant, the author of the 'History of Essex,' and by this connection he eventually inherited the property of his father-in-law, which was considerable. In 1770, on the death of Mr. Morant, who had till then superintended the printing of the Ancient Records of Parliament begun five years before, Astle was appointed by the House of Lords to take his place, and he presided over the publication till its completion in 1775. He was then made chief clerk in the Record Office in the Tower; and some years after he succeeded to the place of Keeper. He was, besides, a Fellow of the Royal and Antiquarian Societies, and, till his death, one of the Trustees of the British Museum. He died on the 1st of December, 1803. Mr. Astle is the author of a number of articles in the 'Archæologia,' and several separate antiquarian publications. But the work by which he is best known is his 'Origin and Progress of Writing,' first published in quarto in 1784, and again in 1803. Mr. Astle inherited, with the estates of Dr. Morant, his library, which he greatly extended. The printed books were purchased soon after Mr. Astle's death for 1000*l.* by the Royal Institution, of whose library they now form a very important part. His immense collection of manuscripts he left by will, in token of his gratitude to the Grenville family, to the Marquis of Buckingham, on payment of the almost nominal sum of 500*l.* Combined with the collection of ancient Irish manuscripts formed by Charles O'Connor, and others added by Mr. Grenville, they formed an assemblage of original materials for the history of the three kingdoms, unequalled in any private collection. They were announced for sale with the rest of the Stowe library in 1849, but were previously purchased by Lord Ashburnham.

ASTOLPHUS succeeded his brother Ratchis as king of the Longobards, A.D. 750, Ratchis having voluntarily abdicated, and retired into the monastery of Monte Casino. Astolphus early formed the resolution to aim at driving away the Greeks from Italy, and with this view broke the treaty made by his predecessor with the Byzantines. In 752 he took Ravenna, expelled the Exarch, and conquered the Pentapolis, which comprised part of the present March of Ancona. He then turned his arms against the duchy of Rome, which still acknowledged, at least nominally, the authority of the eastern empire. The pope, Stephen II, sent ambassadors to Astolphus with splendid gifts, and obtained a truce for forty years. Four months after however, Astolphus broke the truce, and the pope, despairing of assistance from the indolent Byzantine court, had recourse to Pepin, king of the Franks. Stephen himself repaired to Paris in 753, where he crowned Pepin, and bestowed on his two sons, Carlomann and Charles (afterwards Charlemagne), the title of Patricians of Rome. Pepin soon after marched an army into Italy, defeated Astolphus, and besieged him in the city of Pavia. A treaty was concluded, which Astolphus failed to observe, and in 755 Pepin crossed the Alps a second time, and again besieged Astolphus in Pavia. Astolphus now sued for peace; he paid a large sum to Pepin for the expenses of the war, and gave up the Exarchate, including Comacchio, as well as the Pentapolis, which were bestowed by Pepin on the see of St. Peter. Pepin sent the abbot of St. Denis, who received the keys of the various towns from Astolphus's commissioners, and deposited them with Pepin's act of donation on the altar of St. Peter at Rome. This was the origin of the temporal power of the popes, as independent sovereigns. The territory thus given up included the country of Ravenna and the province since called Romagna. The duchy of Rome was not included in it. Astolphus died in 756, owing to a fall from his horse. Astolphus,

during his quarrels with the pope, founded several monasteries, in one of which his daughters took the veil. (Muratori, *Annali d'Italia*; Sigonius, *De Regno Italiae*; Giannone; Manzoni.)

ASTLEY, PHILIP. As an inventor in his line of art, and as the founder of Astley's amphitheatre, a name known to all the sight-seers of Great Britain, and part founder of Franconi's Cirque Olympique, the equally celebrated establishment of Paris, Astley calls for a notice which would else scarcely be bestowed upon an exhibitor of equestrian feats.

Philip Astley was born at Newcastle-under-Lyne in 1742. In 1753 or 1754 he came to London with his father, who was a cabinet-maker. He worked with his father till 1759, when he enlisted in the 15th, or Elliot's Light-horse. He was already an expert horseman, having, as he says in the Preface to his 'Modern Riding-master,' from infancy made the management of horses his chief study. He was upwards of six feet in height, and possessed of extraordinary muscular power. He in consequence soon distinguished himself in the regimental riding-school, and was made one of the teachers, roughriders, and breakers to his regiment. He served on the continent during the last three or four years of the Seven Years' War, and by various serviceable deeds, exhibiting marked intelligence as well as courage and presence of mind, he attracted the favourable notice of the superior officers. For these services he was promoted to the rank of serjeant-major, and on his return to England, in 1765, having solicited his discharge, honourable mention was made of them in his certificate of service.

While in the army he had been accustomed to amuse himself and his comrades by repeating the equestrian feats which he had seen displayed by Johnson, a performer whose career was almost as remarkable as Astley's own; and after obtaining his discharge he practised them for a livelihood. General Elliot had presented him with a charger, as a testimony of the high opinion he entertained of him; and with this horse, and another which he purchased in Smithfield, Astley commenced his performances in an open field near the Half-penny-Hatch, Lambeth, receiving what gratuities casual spectators, or such as were attracted by his handbills, pleased to bestow; and eking out his scanty gains by working occasionally as a cabinet-maker and breaking horses. He also exhibited 'a learned horse,' 'ombres Chinoises,' and sleight-of-hand in the evenings, in a large room in Piccadilly. After some time he engaged part of a large timber-yard, on which he erected an unroofed wooden circus. His performances here became very popular, and before 1775 they would seem to have excited the curiosity of royalty; as in the dedication to the king, prefixed to his 'Modern Riding-master,' published in that year, he speaks of having been commanded to exhibit his 'manly feats of horsemanship' before his majesty. In 1780 he opened a larger and more substantial building, though also constructed of wood, on the site of his former one, and entitled it the 'Amphitheatre Riding-house,' in which he introduced for the first time musical pieces, dancing, and pantomimic action, as well as horsemanship; he also added a stage and scenery. Not being licensed, he was imprisoned under the Act 25th George III., but was released, and obtained a licence, through the intercession of Lord Thurlow, whose daughters he instructed in riding. In 1785 he added sleight-of-hand performances to the attractions of his amphitheatre; and in the same year he published 'Natural Magic, or Physical Amusements Revealed,' explaining some of his tricks. The name of the amphitheatre, which was from time to time increased in size, and altered in its decorations, was changed by the proprietor, first to 'The Royal Grove,' and afterwards to the 'Amphitheatre of Arts;' but the name given to it by the public, and which has survived both him and his family, was 'Astley's Amphitheatre.'

In 1794 Astley made the campaign in Holland as a volunteer. He published two works during that year:—'Remarks on the Duty and Profession of a Soldier;' and 'A Description and Historical Account of the Places near the Theatre of War in the Low Countries, by Philip Astley, Esq., of Hercules Hall, Lambeth, London.' In 1794, as in his youthful campaign, Astley distinguished himself by his courage and kindly disposition. At the siege of Valenciennes he re-took a piece of ordnance which the French had captured. The Duke of York gave him two horses as a reward for his gallantry: Astley sold them, and expended the money in providing comforts for the soldiers with whom he was acquainted. In the winter he laid out a considerable sum in providing every soldier in his own troop with a flannel waistcoat, having a shilling sewed in one of the pockets, and a packet of needles, thread, and other little articles essential to their comfort.

During his absence his amphitheatre was burned down. This happened on the 16th of August 1794. As soon as he heard of the accident he obtained leave of absence, returned home, and rebuilt his amphitheatre: he re-opened it on Easter Monday, 1795. A similar misfortune befell him in September 1803, when he was absent in Paris, and was repaired with the same energy and expedition. It was somewhat earlier than this that he had associated himself with Franconi in founding the Cirque Olympique at Paris. His last literary work was one on which he had been engaged for several years, 'Astley's System of Equestrian Education,' published in 1801. He died at Paris of gout in the stomach, on the 20th of October 1814.

It would be absurd to criticise Astley's books as literary productions; but, in addition to their high merit as manuals of equestrian

instruction, they contain a fund of garrulous anecdote, and occasional remarks indicative of an undeveloped artistical sense.

(*Biographical Dictionary of the Useful Knowledge Society; Biographie Universelle.*)

ASTRUC, JOHN, an eminent French physician, was born at Sauve, in Languedoc, March 19, 1684: he studied in the University of Montpellier, and took the degree of Doctor in Medicine in 1703. In 1706 he acted as substitute to Chirac, one of the university professors, who had been forced to attend the French army. In 1710 Astruc obtained by competition the chair of anatomy and medicine in the University of Toulouse, where he revived the study of anatomy. The reputation however which he now acquired caused him to be soon recalled to Montpellier, where he occupied a medical chair from 1715 to 1728, when he resorted to Paris; but soon after was induced, by his love of travel and a desire to extend his medical views, to accept the situation of first physician to the king of Poland and elector of Saxony. After a very short stay however he returned to Paris, and was in 1730 appointed a consulting physician to the king of France, and in 1731 professor of medicine in the College of France. He became a member of the medical faculty of Paris in 1743, and died in 1766.

Although no great discovery is attached to Astruc's name, he acquired great celebrity among his contemporaries, both as a teacher and as an author; and the integrity of his character was justly appreciated. A simple and happy method in treating the subjects which he taught, and an easy, clear, and eloquent language, recommended him as a lecturer. His writings displayed a solid and extensive acquaintance with the history of literature and science, the result of the unvaried assiduity with which from his early youth, and during the whole of his long career, he applied himself to bibliographical learning. Astruc has left a considerable number of works on medicine, on the long-standing controversy between the physicians and surgeons of Paris, on the natural history of Languedoc, his native country, on metaphysics, and even on sacred history. In 1710 he published his first work on the theory of 'Digestion,' which he endeavoured to explain according to the principles then prevalent of the philosophy of Descartes. This was followed by a long succession of others, the latest 'Mémoires pour servir à l'Histoire de la Faculté de Médecine de Montpellier,' on which he had spent much time, and was most anxious to complete, but left unfinished, having been published after his death by Lorry. Among the subjects on which Astruc wrote most fully, and on which he was long regarded as an authority, were the plague, and the diseases of women. But his most extensive work, and that which has chiefly served to establish his high reputation, is his 'De Morbis Veneris,' first published in one volume 4to, Paris, 1736, and afterwards enlarged to two volumes 4to, in the second edition, 1740. The first edition of this work was translated into English by William Barrowby, M.D., Lond., 1737, 2 vols. 8vo.

(A full account of Astruc's life has been given by Lorry in his posthumous edition of that author's *Mémoires pour servir à l'Histoire de la Faculté de Médecine de Montpellier*, Paris, 1767. See also Hazon, *Notice des Hommes Célèbres de la Fac. Méd. de Paris*, Paris, 1778, p. 256; the *Biographie Médicale*, tom. i., and the *Biographie Universelle*, in which will be found a list of his writings.)

ATAHUALPA, the last Inca of Perú, was the son of Huayna Capac, the eleventh Inca, by a princess of Quito, or Quito. His mother not being of the royal family of Perú, Atahualpa could not, on this account, succeed his father. But Huayna Capac, who loved him passionately, was desirous that Atahualpa should succeed to the throne of Quito, which kingdom had been added to his empire. The hereditary prince Huascar having been induced to assent, Atahualpa was placed on the throne of Quito during the life of his father. But on the death of the inca, which, according to Garcilaso, took place in 1523, Huascar insisted as the conditions of leaving his brother undisturbed in the possession of his kingdom, that he should not make any new conquests on his own territory, and that he should render him homage as his liege lord. Atahualpa agreed, and on pretence of visiting Cuzco to celebrate the obsequies of their deceased father, and to render homage to Huascar, he contrived to assemble at Cuzco a force of more than 30,000 veterans who had served under his father. Huascar was warned of these proceedings by some of the old governors of the province, but before he had time to prepare himself, more than 20,000 men belonging to Atahualpa had crossed the Apurimac, and were within a hundred miles of Cuzco. Huascar assembled as large a body of troops as he could muster. The armies met in a plain six miles from Cuzco. After an obstinate battle, victory was decided in favour of Atahualpa. Huascar was taken prisoner, and kept in chains. But Atahualpa had resolved to make himself Inca of Perú, and as by the laws of the country he had no claim to the throne while there were members of the family whose mothers were of the blood-royal of Perú, he determined to rid himself of all who possessed this double qualification. Accordingly he invited to Cuzco all the male descendants of the incas, more than 200 in number, and then commanded them to be seized and put to death, without distinction of age or sex. Some were beheaded, others precipitated from rocks, women and children were hung by their hair from trees, and left to die there. The servants of the household of the inca and the inhabitants of all the towns in the neighbourhood of Cuzco, are also said by the Spanish historians to have been destroyed. The date of these

atrocious proceedings is not stated, but it must have been between the death of Huayna Capac in 1533 and the arrival of Pizarro in 1532.

In the midst of these civil discords, the Spaniards arrived in Perú. Atahualpa terrified at the accounts which he received of them, and knowing that Huascar had sent secretly to entreat their assistance, despatched an embassy, accompanied by a rich present, with a view to gain the favour of the invaders. The ambassador was very civilly received by Francisco Pizarro, who on his part sent his brother Hernando to visit Atahualpa to offer him his friendship, and to demand an interview. On the following day, November 16, 1532, Atahualpa, accompanied by 8000 men unarmed, went to visit Pizarro. On his arrival, Father Valverde, in a long harangue, endeavoured to acquaint the Inca with the doctrines of the Catholic religion, and declared to him that his kingdom had been given by the pope, the vicar of God, to the mighty Emperor Carlos, and that consequently he was bound to surrender it, otherwise both he and his subjects would be destroyed with fire and sword. The Inca commenced a reply, through an interpreter, marked by a grave dignity, in which he refused to acknowledge the right of the Spaniards to his throne. But he was not permitted to finish his speech. The Spanish cavalry fell upon the unarmed multitude who had assembled, attracted by the novelty of the sight, sabring and trampling under the feet of their horses old men, women, and children. Francisco Pizarro, at the head of the infantry, attacked the guard of Atahualpa, who, at the command of their Inca, offered no resistance; and the Spaniards, after seizing Atahualpa, and loading him with chains, conducted him as a prisoner to the royal seat of the Incas at Caxamarca.

Atahualpa offered Pizarro, for his ransom, to cover the pavement of his prison with vessels full of gold and silver; and further, raising his hand as high as he could reach, and making a mark in the wall, promised to fill the room up to that height with the same precious metals. Pizarro agreed to this proposal, and the Inca gave the necessary orders for procuring the ransom. Atahualpa though imprisoned, was in communication with his generals, and ordered them to remove his brother to Jauja, and soon after, on finding that he was still seeking the interference of Pizarro, commanded him to be put to death.

Atahualpa's own death was near at hand. A Peruvian renegade, called Felipillo, who served as an interpreter to the Spaniards, and who reckoned on obtaining as the price of his treachery one of the Inca's wives, falsely accused Atahualpa of having secretly given orders to his subjects to arm against them. The Inca was accordingly brought to trial before a court appointed by Pizarro, and of which he constituted himself and Almagro the judges. Some of the Spanish officers remonstrated against the injustice of such proceedings, and represented the disgrace which would be brought on the Spanish name if this conduct was persisted in, urging that if Atahualpa was to be tried, he should be sent to Spain to be judged by the emperor. Atahualpa was eventually tried by a military commission, at which Pizarro and Almagro presided, and compelled the other members of the commission to find the unfortunate Inca guilty of various false and ridiculous charges, the chief of which were the false one above mentioned, and the murder of his brother. He was sentenced to be burned to death. On his way to the place of execution, he desired to be baptized, in consequence of which he was strangled only. It is said that he exhibited great courage and firmness in his last moments. Atahualpa is described by the Spanish historians as a man of handsome and noble presence, of a clear, quick, and penetrating mind, cunning, sagacious, and brave. In estimating the character of Atahualpa, it must be remembered that the only narratives of his conduct which we possess are those of Garcilaso de la Vega and other Spanish writers. The accounts given of his conduct from the personal observation of these writers certainly suggest the idea of a very different person to the murderer of the royal family of Perú. Of the revolting perfidy and brutality of Pizarro there can be no second opinion.

(Vega (El Inca Garcilaso), *Comentarios Reales de los Incas*, part i., book 9, chap. 2 to the end; part ii., book 10, chap. 17; Prescott, *Conquest of Perú*, vol. 1.)

ATA-MELIK, or with his complete name, ALA-EDDIN ATA-MELIK AL-JOWAINI, was born (probably 1226 or 1227) in the district of Jowain near Nishapur in Khorasan, in which country his father Boha-Eddin successively filled several offices of importance under the Mogul government. Ata-Melik received a careful education; and Argun, the governor of Khorasan, chose him for his companion on two journeys into Tartary, and in 1251 introduced him at the court of the Mogul emperor Mangu Khan, at Karakorum. Here Ata-Melik remained for a considerable time, and began to write his great work on the history of the Moguls, on account of which he undertook several excursions into Mawaralnahr, Turkistan, and the ancient country of the Uighurs. When Argun was, in 1255, again called to the court of Mangu Khan, he left his son Kerai-Melik, with Ata-Melik, in the camp of Sultan Hulaku, the brother of Mangu Khan, as governors of Khorasan, Irak, and Masenderan, during his absence. Ata-Melik soon gained the entire confidence of Hulaku, and accompanied him in his expedition against the Abasside kalif Mostasem. After the capture of Baghdad by the Moguls (1258), Ata-Melik was appointed prefect of that city, the dignity of vizir being at the same time conferred on his brother Shems-eddin. Both continued to hold

these offices under Abaka Khan, the successor of Hulaku, and the province of Baghdad, which had suffered much from the incursion of the Moguls, began to flourish again under their administration. Ata-Melik died in 1282, his death being accelerated by his having been imprisoned and stripped of all he possessed on a charge of peculation. He was indeed not only freed from this charge by Sultan Ahmed, but restored to his former dignities. Subsequently however Ahmed was defeated, and Argun, a son of Abaka Khan, having made himself master of Baghdad, Ata-Melik was so excited by dread of a renewal of the former proceedings, that he died a few days after Argun's entry into the city. His work on the history of the Moguls, entitled 'Jehan-Kushai' (that is, the conquest of the world), is by some of the most esteemed Oriental writers (for example Abulfaraj, Mirkhond, &c.) referred to as the principal authority on that subject. (There is a memoir on the life and writings of Ata-Melik, by Quatremère, in the *Mines de l'Orient*, vol. i., p. 220, &c.)

ATAULPHUS, ATAULF, or ADAULF, brother-in-law of Alaric, king of the Visigoths, assisted him in his invasion of Italy. After Alaric's death, near Cosenza, Ataulphus was elected his successor in A.D. 411. In the following year he led his bands out of Italy into Gaul, with the intention, as it would appear, of joining Jovinus, who had revolted against the empire. His aid being declined, Ataulphus attacked and defeated Jovinus, who was taken and put to death. Ataulphus married Placidia, the sister of the emperor Honorius, at Narbo (Narbonne) in southern Gaul, at the beginning of the year 414. He appeared on the occasion dressed after the Roman fashion, and presented his bride with many vases full of gold and jewels taken at the plunder of Rome in 410. Ataulphus afterwards withdrew into Spain, where he was treacherously killed at Barcelona by one of his equerries, in 417. His widow Placidia was given by her brother Honorius in marriage to the consul Constantius. (Jornandae; Zosimus; Orosius; Gibbon.)

ATHALIAH, queen of Judah, was the daughter of Ahab, king of Israel and his wife Jezebel, and the wife of Jehoram, king of Judah. When Athaliah heard that her son Ahaziah, who had succeeded his father as king of Judah, had been slain by Jehu with other members of the family of Ahab, she immediately seized the vacant throne and caused all the males of the royal family to be murdered, with the exception of Joash, who was rescued by Jehosheba, her daughter, and secreted in the temple by the high-priest Jehoiada. Her reign appears to have been an unquiet one, but she maintained her position for six years. At length Jehoiada, having informed several of the leading men of Judah of the existence of Joash and secured their co-operation, on a day already agreed on, brought the young prince publicly forward in the temple and solemnly anointed him King of Judah. Athaliah hearing the shouts rushed to the temple, but the guards seized her, and by direction of Jehoiada led her out of the temple and put her to death. According to the chronology of Usher, Athaliah reigned from B.C. 884 to 877; Hales makes her to have reigned from B.C. 895 to 889. The history of her reign will be found in 2 Kings viii. 18, 26; xi.; 2 Chronicles xxi., xxii., xxiii.

ATHANAGILDUS, a captain of the Spanish Goths, revolted against his king, Agila, and being joined by a Roman force from Gaul, sent by the emperor Justinian, defeated and killed Agila, near Seville, A.D. 554. Athanagildus was then proclaimed king of the Goths in Spain. He afterwards endeavoured, without success, to drive his Roman allies out of Spain. He reigned fourteen years over that part of the country which was occupied by the Visigoths, and his administration has been spoken of by the historians as firm and judicious. He had two daughters, one of whom, Galawinda, he gave in marriage to Chilperic, the French king of Soissons; and the other, Brunehault, married Siegbert, king of Metz, or Austrasia, and became famous in French history. [BRUNEHULT.] Athanagildus died at Tolodo in 567. (Mariana, *Historia General de España*.)

ATHANARIC, a chief or judge of the Goths who had settled themselves on the borders of the Roman empire, north of the Danube, about the middle of the 4th century. Having aided Procopius in his rebellion, the Goths were attacked and defeated by the emperor Valens in A.D. 369. They then sued for peace, and an interview took place on this occasion between Valens and Athanaric, in a boat in the middle of the Danube. Some years after, the Huns having come down from the banks of the Volga, threatening the territory of the Goths, Athanaric opposed the barbarians at the passage of the river Dniester, but he was surprised, and obliged to retire with a part of his followers into the fastnesses of the Carpathian Mountains. The rest of the Goths, under Fritigern, threw themselves on the empire for protection, and were allowed to cross the Danube and settle in Thrace. They afterwards quarrelled with the emperor Valens, whom they defeated and killed in the battle of Adrianople, in August, 378. Athanaric remained in his fastnesses until 380, when he was compelled to fly before the barbarian hordes who poured down from the north. Having obtained permission from Theodosius, he repaired to Constantinople, where he was received with great pomp, in January, 381; but having, as is said, surfeited himself at the emperor's table, or perhaps worn out with the hardships and fatigue he had previously endured, he soon after died, and was buried with great magnificence by order of Theodosius. (Gibbon, c. xxv., xxvi., and authorities there cited.)

ATHANASIUS, ST., archbishop of Alexandria, was born at Alexandria, at the close of the 3rd century; and was first the pupil, and afterwards the secretary, of the Archbishop Alexander. In 325 he attended his patron to the council of Nice; and there he acquired, by his controversial acuteness and zeal, so general a reputation, that Alexander did not hesitate to recommend him, notwithstanding his youth, as his own successor in the see of Alexandria, and on the death of that prelate in the following year he was duly elected by the clergy and people; and the act was confirmed without any opposition by the hundred bishops of Egypt. When Arius was recalled from exile, probably in 327, Athanasius, though scarcely installed in his dignity, refused (as some say) to comply with the will or wish of the Emperor Constantine, that the heretic should be restored to communion. This strife, which had commenced at Nice, Athanasius continued to prosecute on every occasion, and by every means in his power, till the end of his days. But his enemies were powerful in Syria and Asia Minor. Several serious charges were alleged against him, and he was summoned before a numerous council assembled at Tyre in 334. He appeared, and was condemned; and Constantine exiled him to Gaul. This was his first persecution; but it ended, in about two years, with the life of the emperor. Athanasius returned; but, as the decision of Tyre was yet unrepealed, and as Constantius, who after a short interval succeeded to the Eastern empire, was opposed to the Nicene faith, a council of ninety Arian bishops assembled at Antioch in 341, and confirmed the sentence of deposition. The civil authority then again interposed, and the archbishop was once more sent into banishment. His refuge on this occasion was Italy; but there he found zealous supporters among the body of the clergy, among the leading prelates, and in the orthodox Emperor Constantine. His doctrine was asserted in 347 by the council of Sardica; and Constantius was preparing to reinstate him by arms, when the Emperor of the East relented, and recalled him to his see in 349. The people of Alexandria, whose fidelity had never been shaken, received him with triumphant exultation. His authority was confirmed, and his reputation was everywhere diffused, to the most remote extremities of the Christian world. But when Constantius, at his brother's death, acquired the greater portion of the Western empire, he once more directed the whole weight of his power against Athanasius. Yet he ventured not even then to proceed by the exercise of authority to his object: he temporised. He went in person into the west; he summoned councils, first at Arles, then at Milan, and endeavoured to procure some act of ecclesiastical condemnation against his subject. By much importunity, and means the most unworthy, he succeeded; and Athanasius was denounced in 355, in that city which, only twenty years afterwards, glorified in its spiritual subjection to the orthodox rule of Ambrose. When the sentence was enforced, some tumults arose at Alexandria, and blood was shed: but the prelate, perceiving the inequality of the contest, withdrew from his capital (for the third time), and concealed himself in the deserts of Upper Egypt. There, through the fidelity of the monastic disciples of St. Antony and the reverence, almost superstitious, which he seems to have inspired, he continued for six years to elude the imperial officers, and employed his enforced leisure in composing some of his principal writings; and it would seem from his own statements that he was present at the synods of Seleucia and Rimini. On the death of Constantius in 361, he returned to his see; and though as the great adversary, not then of Arianism, but of Paganism, he was for a while again driven from his charge by Julian, and was likewise compelled, by the violence of Valens, to seek safety for a few months, as is said, in his father's tomb (and these are sometimes called his fourth and fifth persecutions), he retained his dignity in comparative repose to the end of his long life, in 373.

Athanasius was unquestionably the brightest ornament of the early church. And his prudence was not the least remarkable of his characteristics. With the most daring courage, and an unwearied devotion to his cause, and perseverance in his purpose, he combined a discreet flexibility, which allowed him to retire from the field when it could be no longer maintained with success; and to wait for new contingencies, and prepare himself for fresh exertions. If he did not passionately seek the crown of martyrdom, it was not that he loved life for itself, but for the services which its continuance might still enable him to render to the church. He was no less calm and considerate than determined; and while he shunned useless danger (see his 'Apology for his Flight'), he never admitted the slightest compromise of his doctrine, nor ever attempted to conciliate by any concession even his imperial adversaries. And it should not be forgotten that the opinion for which he suffered eventually prevailed, and has been professed by the great majority of Christians from that day to this. "In his life and conduct," says Gregory Nazianzenus, "he exhibited the model of Episcopal government—in his doctrine, the rule of orthodoxy." Again, the independent courage with which he resisted the will of successive emperors for forty-six years of alternate dignity and misfortune, introduced a new feature into the history of Rome. An obstacle was at once raised against imperial tyranny: a limit was discovered which it could not pass over. Here was a refractory subject, who could not be denounced as a rebel, nor destroyed by the naked exercise of arbitrary power; the weight of spiritual influence, in the skilful hand of Athanasius, was beginning

to balance and mitigate the temporal despotism; and the artifices to which Constantius was compelled to resort, in order to gain a verdict from the councils of Arles and Milan, proved that his absolute power had already ceased to exist. Athanasius did not, indeed, like the Gregories, establish a system of ecclesiastical policy and power—that belonged to later ages, and to another climate—but he exerted more extensive personal influence over his own age, for the advancement of the Catholic church, than any individual member of that church has ever exerted in any age, except perhaps St. Bernard. "In all his writings (says Photius) he is clear in expression, concise and simple; acute, profound, and very vehement in his disputations, with wonderful fertility of invention; and in his method of reasoning he treats no subject with baldness or puerility, but all philosophically and magnificently. He is strongly armed with Scriptural testimonies and proofs, which is chiefly apparent in his discourse against the Greeks, in that on the 'Incarnation,' and in his 'Five Books against Arius,' which are indeed a trophy of victory over heresy, but chiefly over the Arian." Others of his numerous works throw much light on the history of his times, such as his 'Disputation with Arius in the Council of Nice;' his 'Narrative, concerning the same Council;' his 'Epistle to Serapio on the Death of Arius;' his 'Epistle on the Synods of Rimini and Seleucia,' and others. There are also Catholic epistles and sermons; a long 'Letter to the Solitaries,' and a 'Life of St. Antony, the founder of their institutions; as well as controversial writings against Meletius, Paul of Samosata, and Apollinaris; 'On the Divinity of the Holy Spirit;' and 'Against every Denomination of Heresy.' The earliest edition of any part of his works appeared at Vicenza in 1482, and in Latin only; the whole, according to Hoffman, were published at Paris in 1519, also in Latin: they were next published in Greek, with the translation of Naannus, at Heidelberg, in 1601. The 'Four Orations against the Arians' were Englished by Samuel Parker, 2 vols. 8vo, Oxford, 1713. Translations of the Epistles in defence of the Nicene definition, and some other of his shorter writings, published by the Rev. J. H. Newman, Oxford, 1842, &c. The two Creeds, called the Nicene and the Athanasian, have been vulgarly considered as being, in part at least, if not entirely, the productions of Athanasius. In respect to the former, there can be no doubt that it was composed—as far as the words "I believe in the Holy Ghost," for what follows is of a later date—by the direction of the Council of Nice and probably by members of that Council; and therefore Athanasius, as one of those members, may have assisted in the composition. But there is no ground to believe that the work was peculiarly his own. In regard to the Creed called by the name of Athanasius, all reasonable writers now agree that it appeared in a later age than his, in the Western Church, and in the Latin language. It contains definitions of faith, which are obviously borrowed from the decisions of councils posterior to the death of Athanasius. And respectable writers, as Vossius, Quessel, and others, have ascribed it, with no great improbability, to one Vigilius Tapsensis, also an African bishop, who lived at the end of the 5th century. A complete list of the works of Athanasius, including the doubtful and supposititious as well as the genuine, is given in Fabricius, 'Bibl. Græc.,' ed. Hales, vol. viii., 184-215; Socrates, 'Hist. Eccles.,' l. i. c. 8, 9, 23; l. iii. c. 4, et. seq.; Sozomen, 'Hist. Eccles.,' l. ii. c. 17, 25, 30; l. iii. c. 2, 6; Theodoret, 'Hist. Eccles.,' l. i. c. 25, et seq.; l. ii. c. 6, 9, et seq.; Philostorgius, l. i. ii. iii.; Sulpicius Severus, 'Historia Sacra,' l. ii.; Gregorius Nazianzenus, 'Orat.,' 3, xxi.; Photius, 'Bibliotheca,' p. 1430, edit. Genev., and fragment in the Preface to the Paris edition (1627) of the 'Works' of Athanasius; Tillemont, 'Mémoires Eccles.' tom. viii.

(*Biographical Dictionary of the Society for the Diffusion of Useful Knowledge.*)

ATHANASIUS, the rhetorician, bishop of Constantinople, wrote a work entitled 'Aristotelis Propriam de Animæ Immortalitate Mentem Explicans,' Gr. et Lat. 2 libris; Paris, 1641, 4to: and also 'Antepatellarus, seu de Primatu S. Petri; Epistola de Unione Ecclesiarum ad Alexandriæ et Hierosolymorum Patriarchas; item Anticampanella, in compendium reductus,' Gr. et Lat., Paris, 1655, 4to. He died at Paris in 1663, in his 92nd year.

ATHELSTAN, one of the most illustrious of the Anglo-Saxon sovereigns of England, was the eldest son and successor of Edward the Elder, and the grandson of Alfred the Great. He was the first who called himself king of the English; his father and grandfather having been content to call themselves kings of the Anglo-Saxons, whilst Egbert and the sovereigns between him and Alfred, were only styled kings of Wessex. Athelstan was born about 895, six years before the death of Alfred. His mother appears to have been a person of lowly birth, the daughter of a Saxon husbandman.

Edward, the only son of Edward the Elder who had arrived at years of maturity except Athelstan, died a few days after his father. Athelstan was nominated in his father's will as his successor, and the voice of the people and the vote of the Wittenagemote having sanctioned Edward's nomination, Athelstan was crowned at Kingston-upon-Thames in 925. But his election had not been unopposed, and he had to defend his right to the throne against a party who espoused the cause of some of the younger children of King Edward. Edwin, one of his brothers, was lost in the English seas somewhere about 933, and the memory of Athelstan is, by some of our early historians, charged with his murder—Edwin having, it is alleged, been driven

out to sea by his orders in tempestuous weather in an open and shattered boat, with only a single companion;—but the story is beset with difficulties. As far as the events of those times have come down to us, it would seem that Athelstan contemplated making himself master of the whole island of Britain, not excepting the parts which formed the kingdom of Scotland. He did not accomplish all this, but he gained territory from the chiefs who held Cornwall, and tribute (if not territory) from Hoel, the then sovereign of Wales. The chroniclers represent him as permitting Hoel still to reign, and saying that it was more glorious to make kings than to be a king. After some successful attacks upon Sigtric, king of Northumbria, he consented to terms of peace, and gave one of his sisters in marriage to that king. Sigtric however soon died, when Athelstan seized upon his dominions, Anlaff, the son of Sigtric, and another son, being compelled to abandon the island. Neither Scotland, nor any other of the neighbouring states which still maintained a political independence, saw with satisfaction the growing power of Athelstan; and Anlaff, the exiled son of Sigtric, made every exertion to regain the sceptre which had been forcibly wrested from him. A large portion of the inhabitants of Northumbria were of the Danish race, and they yielded on that account the more reluctantly to their new master. There was a national sympathy and community of interest with the Danes and Northmen generally, of which Anlaff took advantage, and prevailed with them to send a very powerful force to assist him in re-establishing the Northumbrian sovereignty. On this occasion the Welsh, the Scots, and the Irish, all combined to assist Anlaff. Athelstan had however by that time consolidated his power by his prudent counsels and good government, and the issue of the war contributed to establish still more securely his power at home, and to extend his reputation abroad. He marched against the confederated chiefs; the armies engaged at a place called by the early chroniclers Brunenburgh, and Athelstan gained a complete victory. The victory at Brunenburgh became known as the Great Battle, and is celebrated alike in Saxon history and Saxon song, and among the Saxon poems which have come down to us is a very remarkable one devoted to the battle of Brunenburgh and the glory of Athelstan.

One effect of this victory was to extend the name and reputation of Athelstan beyond his own shores. He had from that time great influence in the affairs of neighbouring kingdoms. His sisters were given in marriage to the son of the emperor of Germany, to the princes of France and Aquitaine, and to a northern chief. Louis, afterwards Louis IV., Hucoc, afterwards king of Norway, and an expelled duke of Brittany took refuge in England, and sought Athelstan's assistance for the recovery of their dominions; and the evidence of foreign contemporary historians, as collected by Mr. Sharon Turner in his 'History of the Anglo-Saxons,' shows the high respect in which Athelstan was held by the continental sovereigns and nations. He may indeed almost be said to have held the balance of power for some years among the kings of the continent.

Athelstan died at Gloucester, October 25, 941, being only in his 47th year. He was buried under the altar of the abbey at Malmesbury. His life, as William of Malmesbury said, "was in time little, in action great;" and there cannot be a doubt that under him England was advancing in consequence as one of the powers of Europe, and in civilisation and improvement in her internal affairs. Athelstan had no family and was succeeded by Edmund, his brother.

Athelstan did not labour more to secure his throne and to extend his power and political influence than to give security and legal government to his people. Alfred had left a code of laws to which Athelstan made additions, the principle on which he proceeded being to bring all classes, the ecclesiastics as well as others, within the scope of certain great principles. There are traces in his laws of a public provision for some of the poorest and most destitute of his subjects. Himself of a studious as well as religious turn, he promoted the erection of monasteries, which was in fact at once to provide seats and centres of religious ministrations, and places for retirement and security to persons devoted to study; and he encouraged the translation of the Holy Scriptures into the vernacular tongue. Two very ancient manuscripts, which there is sufficient reason to believe once belonged to Athelstan, are preserved among the Cottonian Manuscripts in the British Museum. One of them is supposed to be the very copy of the Gospels on which the Saxon kings took the oath at their coronation.

Silver. British Museum.

On this coin the name is written 'Edelstan.'

ATHENÆUS, a native of Naucratis in the Delta of Egypt, was a contemporary of the Emperor Commodus, for he saw Commodus riding in a chariot, equipped in the style of Hercules ('Deipnosoph.', xii. 637). Athenæus went from Egypt to Rome; but of his life nothing

further is known. Besides a history of the Syrian kings (v. 211), which is lost, he wrote a work, in fifteen books, entitled *Δειπνοσοφισταί*, or 'Feast of the Wise Men,' as it is generally translated, although it would be more conformable to the analogy of the language to translate it the 'Feast-learned,' that is, the skilled in devising what is good for a feast: it has also been rendered 'Contrivers of Feasts.' The first two books and the beginning of the third are only extant in the form of an epitome; the rest of the work is complete, or nearly so. The author represents himself as describing to his friend Timocrates an entertainment at the house of Larensius, a wealthy and learned Roman, who had been promoted by the Emperor Marcus Aurelius to the superintendance of sacred things and sacrifices. Larensius, it is also said, was well acquainted with the learning of the Greeks, was the compiler of a body of law from old enactments, and he possessed an unrivalled collection of Greek books. The entertainment was not confined to eating and drinking; it was also a feast of words. Larensius collected at his banquet many distinguished men, and proposed to them various curious matters for discussion. In an introduction prefixed to the first book, the epitomist gives a list of these distinguished guests, among whom were Masurius, an expounder of law; *Emilianus* of Mauritania; *Zoilus*; *Ulpianus* of Tyre; *Galenus* of Pergamum, the author of numerous philosophical and medical treatises; *Rufinus* of Nicæa, and others. The death of *Ulpian* is mentioned in the work (xv. 689), and it is generally assumed that this *Ulpian* is the distinguished Roman jurist. *Ulpian*, the jurist, was murdered by the Prætorian soldiers in the presence of the emperor *Alexander Severus* and his mother, in A. D. 228. But there are no sufficient reasons for supposing that this *Ulpian* is the jurist; and on the supposition that he is, the chronological difficulties as to the date of the feast are considerable, for the feast would be held, according to that supposition, in A. D. 228, at the house of Larensius, a man who had received the highest honours from *Marcus Aurelius*, at least forty-eight years before; and *Athenæus* represents himself as present at the entertainment. But in fact the passage in which *Athenæus* speaks of Larensius being honoured by *Marcus*, rather implies that Larensius was then enjoying his honours under *Marcus*, which would fix the supposed date of the feast in the reign of *Aurelius*, and altogether dispose of *Ulpian* the jurist. And this passage is probably the foundation of the statement in *Suidas* that *Athenæus* lived in the time of *Marcus*. *Commodus* also was associated with his father in the empire, and *Athenæus* might therefore properly call him *Imperator* in his father's lifetime.

Athenæus dramatised his dialogue, as his epitomist says, in imitation of *Plato*. The first few lines of the first book are given in the epitome in their original form, which begins with a conversation between *Athenæus* and *Timocrates*, and is manifestly an imitation of the 'Phædon' of *Plato*. *Timocrates* asks *Athenæus* to report to him the conversation at the table of Larensius, and accordingly *Athenæus* begins. The dramatic interest of a work could not be sustained on such a plan, and in this respect the 'Deipnosophista' has no value. The speakers discourse at great length, and are continually quoting passages from the Greek writers. The object of the author was to exhibit his extensive and multifarious reading, and with this view he makes the conversation turn on all subjects. The summaries that are printed in the editions of *Schweighæuser* and *Dindorf* give as good a notion of the diversified matter of the book as any longer description. The first book begins, according to the epitome, with a list of the guests, which is followed by a panegyric on the host; it then mentions the libraries of certain persons, certain great banquets, verses adapted to different dishes, the 'Gastronomia' of *Archestratus*, writers on feasts, the gluttony of *Philoxenus* and *Apicius*, and so on. The latter part of the first book treats of various kinds of wines, and the subject is continued in the second book. This second book is curious for the long list of vegetable products which were used at the tables of the ancients. Though the pleasures of the table, and the eatables and drinks that contribute thereto, are the main matter of the work (the seventh book, for instance, is nearly all about fish), an infinite variety of anecdotes and curious facts are interspersed. But the most valuable part of the work consists in the numerous extracts from lost writers. It is said that the number of lost works which *Athenæus* mentions is fifteen hundred; and the whole number of writers that he cites is about seven hundred, many of whom would be otherwise unknown. Of the poets of the middle comedy, he says that he had read and extracted above eight hundred plays (viii. 336). Such a work as this enables us to form some estimate of the prodigious mass of Greek literature, of which we only possess a small portion.

The authors from whom he gave extracts comprise a period extending from *Homer* to the lyric poets *Alcæus* and *Sappho* and *Anacreon*; the philosophical poets *Xenophanes* of *Colophon* and *Empedocles*; the historians *Xanthus*, *Hecataeus* of *Miletus*, and *Herodotus*, down to *Herodes Atticus*, the rhetorician, who died probably about B. C. 180. *Hephaestion*, the grammarian, is also mentioned as a contemporary by *Athenæus*. Though there is much about *Alexander the Great*, *Athenæus* does not quote *Arrian*, but this involves no difficulty, for *Arrian's* work would not contain so much to his purpose as the then extant works on *Alexander's* period. The quotations from the poets, and especially the Attic comic writers, are the most numerous, but there is also a considerable amount of extract from the orators and historians. The fifteenth book contains many scolia and other small

pieces, which the 'Deipnosophists' recite; among them is the famous hymn on Hermeias, tyrant of Atarneus, by Aristotle, of which a copy is also preserved in Diogenes Laertius. (Aristotle, lib. v.) If Ælian took from Athenæus, as it is said, it will be more consistent with the probable chronology of Ælian to place Athenæus in the reign of Marcus and Commodus than of Antoninus Caracalla. [ÆLIANUS, CLAUDIUS.] If all the authors whom Athenæus cites were extant, his work would be worthless; but as so many of them are lost, this compilation has become one of the most valuable relics of antiquity, and a source of instruction and amusement to every scholar.

The first edition of Athenæus was published by the elder Aldus, Venice, 1514, folio, with the assistance of Marcus Musurus: this edition is of little value. In 1556 the first Latin translation appeared at Venice; but it is much inferior to that of Dalecampius (Jacques d'Alechamp), Lyon, 1583, folio. The edition of Casaubon, Geneva, 1597, folio, contained only the text and the Latin version of Dalecampius: the Commentary did not appear till 1600, Lyon, folio. Both were reprinted several times. The latest edition, according to Casaubon's recension, is that of 1657, Lyon, folio. Casaubon did little for the Greek text, but his commentary is useful. The edition of Schweighæuser was founded on the collation of a new manuscript, which once belonged to cardinal Bessarion, and is probably the original of all other manuscripts of Athenæus. Schweighæuser's edition, which appeared between 1801 and 1807, in 14 volumes 8vo, consists of two parts: the first part, in 5 volumes 8vo, contains the text, the revised version of Dalecampius, and the various readings; the first eight volumes of the second part contain the commentary, which comprises the best part of Casaubon's commentary, and the editor's additions. The fourteenth volume contains an index of the writers quoted by Athenæus, and of their writings; an index of the titles of all the works quoted by him; and an index of things and persons. The last edition of Athenæus is by W. Dindorf, Leipzig, 1827, 3 vols. 8vo. The text has been improved, and the various readings are given in short notes at the foot of the page. It contains also the summaries of the contents of the fifteen books, in Greek according to Aldus, and in Latin according to Schweighæuser, an Index Rerum founded on that of Schweighæuser, which in fact is founded on that in Casaubon, and an index of the writers cited by Athenæus, with the addition of all the works of each writer which are mentioned by Athenæus.

It appears that Eustathius either did not use or was unacquainted with the genuine work of Athenæus, for he has often used the epitome only. (Casaubon, 'Animadversiones,' lib. i., cap. 1.) Whether he was entirely unacquainted with the complete work may not be quite certain, but it is very evident that the archbishop of Thessalonica derived much of his learning from the storehouse of Athenæus. There is a French version of Athenæus by the Abbé de Marolles, Paris, 1680, 4to.: this book is very rare. Another French version was made by Jacques Adam, but he only revised the first two books; the rest were translated by Lefèvre de Villebrune, and the whole appeared at Paris in 1789-91. This translation has not a good character. (Fabricius, *Bibliotheca Græca*, v. 602; Schoell, *Geschichte der Griechischen Litteratur*, ii. 508, contains a brief notice of the contents of the several books of Athenæus; Hoffman, *Lexicon Bibliographicum*.)

(*Biographical Dictionary of the Society for the Diffusion of Useful Knowledge*.)

ATHENÆUS, a Greek writer, probably contemporary with Archimedes. A work by him on engines of war (*Περὶ Μηχανημάτων*) is extant, and printed in the collection of Thevenot. This work is addressed to M. Marcellus, supposed to be the conqueror of Syracuse.

ATHENÆUS of Attalia (or according to Cœlius Aurelianus, of Tarsus in Cilicia), a physician who flourished in Rome about the middle of the first century, and established the Pneumatic school in medicine. Of his works, which, according to Galen, were numerous and highly valued, nothing remains except a few fragments preserved by Orbasius and Ætius, and the allusions which are made to his opinions in the writings of Galen. The theory, which originated with Athenæus, and was transmitted by him to his pupils, Agathinus and Herodotus, and adopted by several other distinguished physicians [ARÆTÆUS], derived its name from the 'pneuma,' or spirit, which they regarded as a fifth element, and held to be the cause of health and disease. This 'pneuma' formed an important principle in the physical science of the Stoic philosophers, from whom the Pneumatic physicians seemed to have derived it, adopting at the same time, not only the general philosophical tendency, but the difficult style and dialectic abstruseness of the Stoic sect. The very scanty remains of the Pneumatic doctrine, and their fondness for subtleties, render it difficult to ascertain with any degree of definiteness the nature of their doctrines. The 'pneuma' has been by many supposed to be analogous to the 'vital principle' of some modern physiologists. (Lecterc and Sprengel, *Histories of Medicine*.)

ATHENAGORAS was an Athenian philosopher, who having become a convert to Christianity, wrote an apology for the Christians to the emperor Marcus Aurelius and his son Commodus. He must have lived therefore in the latter half of the 2nd century, and he probably composed his apology about A.D. 177. The 'Apology' is a well-digested and eloquently-written treatise. Athenagoras demands toleration for the Christians, and defends their doctrine and their lives against the

then usual accusations of atheism, incest, eating of the flesh of slaughtered children, &c. The treatise of Athenagoras on the 'Resurrection of the Dead' is in some degree connected with the conclusion of his 'Petition,' as the 'Apology' is entitled. Athenagoras, in his book on the Resurrection, shows the necessity of having the mind freed from prejudice in order to arrive at truth, refutes the objections made against the resurrection, and confirms it by argument. Semler made a fruitless attempt to impugn the authenticity of the 'Petition;' but the objected quotations from the Prophets, and from heathen mythology, as well as the title of philosopher, given to the emperor, are quite appropriate in a Christian apology of the 2nd century. Philippus Sidetes, an ecclesiastical writer, who lived about A.D. 420 at Constantinople, is the only ancient writer who gives any biographical notice of Athenagoras; and he relates that Athenagoras was the first teacher of the catechetical school at Alexandria; and that Clemens of Alexandria was his disciple: but these assertions are inconsistent with ascertained facts, and the authority of Sidetes is of little value.

The older editions of his writings are specified in Fabricii 'Bibliotheca Græca,' vol. v. p. 86, et seq.; and in Oudin, 'Comment. de Script. Eccl.,' vol. i. p. 203, et seq. The best are 'Ath. Legatio pro Christ. et Ressur. Mort.,' Gr. et Lat., edited by Henry Stephens, 1557, 8vo: by Ed. Dechair, Ox., 1706-8, with notes of Gesner and others; reprinted also in Gallandi 'Bibl.,' pp. t. ii.; and in Justin Martyr's Works, by the Benedictines, 1742, fol., with a very good introduction; 'Ath. Deprecatio, vulgo Legatio, pr. Christ.,' Gr. c. ind. et (valuable) not. by Lindner, 1774-8: 'Legat. et de Resurrectione ob. Oberthür,' Gr. et Lat., 8vo, Wirreb, 1777, with Tatian, Theophilus, and Hermias: 'The most excellent Discourse of the Christian philosopher Athenagoras touching the Resurrection of the Dead;' Englished from the Greek (he should have said Latin) of Peter Nannius, by Richard Porder, 8vo, Lond. 1573: 'The Apologetics' of Athenagoras—1, 'For the Christian Religion;' 2, 'For the Truth of the Resurrection,' &c., by David Humphreys, 8vo, Lond. 1714. Several extracts of both pieces are translated in Dr. Lardner's 'Credibility of the Gospel History.'

ATHENION, a comic poet. Athenæus gives a long extract from his 'Samothracians,' lib. xxiv. c. 80.

ATHENION, a painter, born at Maronea in Thrace, and pupil of Glaucion of Corinth. Pliny gives him the extraordinary praise, that "if he had lived to maturity, no one would have been worthy to be compared to him." (*Nat. Hist.*, xxxv. 40, ed. Delph.)

ATHENION, a Sicilian slave, one of the principal actors in the second Servile war which broke out in Sicily, and lasted from the year B.C. 102 to 99. By birth he was a Cilician: he filled the station of steward or overseer to two wealthy brothers, and had himself acquired considerable wealth, which, with the skill in astrology to which he laid claim, procured for him much influence among the servile class. After the insurrection had commenced in other parts of Sicily, he began his career by gaining over the slaves under his own charge, to the number of 200. Other slaves flocked to his standard from neighbouring properties, so that within five days his followers amounted to 1000 men. He then assumed the title and state of a king; and enforced strict discipline among his followers. At the head of a force of 10,000 slaves, he laid siege to Lilybœum. In this attempt he failed; but by good management this check was made to increase his power over his followers, by verifying the powers of divination which he professed. Another slave leader, named Salvius, at the head of a force of 30,000 men, now assumed the title of king, and fixed his residence at Triocala. He summoned Athenion to serve under his command, and Athenion prudently joined Salvius, or as he now called himself Tryphon. Tryphon soon conceived a jealousy for his new associate, whom he imprisoned; but he restored him to his command, when Licinius Lucullus, with an army of 16,000 or 17,000 men, was sent by the Senate to bring the war to a conclusion. In a battle which ensued near Scirthæa the insurgents were defeated, and Athenion severely wounded. Lucullus then laid siege to Triocala, in which he met with no success. He was superseded by L. Servilius, who did no better; and both those generals were banished for their misconduct or ill-success. On the death of Tryphon, Athenion succeeded him, and, unchecked by Servilius, extended his ravages over great part of Sicily. But in B.C. 102, the consul, Manius Aquilius, took the field, and won a decisive victory over the insurgents, in which Athenion was killed. Aquilius pursued the insurgents to their strongholds, and reduced them severally to submission. Thus ended the Servile War in Sicily, in the fourth year, B.C. 99. (Diod., *Ætologæ*, lib. xxxvi. l.; Florus, iii. 19.)

ATHENION, son of a Peripatetic philosopher of the same name, by an Egyptian slave. He was manumitted; kept a school in Athens, where he was naturalised; assumed the name of Aristion, and ultimately became tyrant of Athens. He espoused the interests of Mithridates, and in concert with Archelaus, the king of Pontus's general, held out the city against Sulla, who finally put him to death. [Sulla: the early history of Athenion is given by Athenæus, V. c. 48-53.]

ATHIAS, RABBI JOSEPH, was a famous printer at Amsterdam, who lived during the latter half of the 17th century. Assisted by the most distinguished scholars of Amsterdam, he compared the old editions and manuscripts of the Hebrew Bible, and published in 1661

a new edition, for which John Leusden wrote the summaries and a preface. The second edition of this Bible, published in 1667, in two volumes octavo, received considerable corrections. The editions of the Bible published by Athias were more correct than any former editions: they nevertheless contain many inaccuracies, especially in the vowel points, and still more in the accents. The edition of Athias was bitterly attacked by Samuel Marsius, in a letter published in 1669. A reply to this letter was published under the following title: 'Cæcus de Coloribus, hoc est, Josephi Athias justa Defensio contra ineptam, absurdam, et indoctam Reprehensionem Viri celeb. D. Sam. Marsii,' &c. It has been supposed that Leusden, writing in the name of Athias, was the author of this reply. Notwithstanding its defects, the Hebrew Bible of Athias had great merit, and has been the basis of all subsequent editions. The editions of Clodius, Jablonski, Van der Hooght, Opitz, Michaëlis, Hahn, Houbigant, Simonis, Reineccius, Hurwitz, and others, may be considered as improvements upon that of Athias. The Bible of Athias was the first in which verses were marked with Arabic cyphers, all former editions having only the Jewish method of notation.

Athias printed the Bible also in Spanish, Jewish German (or that jargon mixed with Hebrew which is spoken by the Russian and Polish and some German Jews), and English. On the completion of his Hebrew Bible, the States General of Holland presented a gold chain and medal to Athias. His death took place in 1700, when he was carried off by the plague. His son Emanuel Ben Joseph Athias succeeded him in his business, and fully maintained the reputation of the establishment. The most celebrated production of his press was an elegant little edition of the Hebrew Bible, edited by Nuñez Torres, with the commentary of Rashi, 4 vols. 18mo, A.M. 5460-5463 (1700-1703.)

(Woolf, *Bibliotheca Hebraica*, tom. i. p. 552-554; Le Long, *Biblioth. Sac.*, part I. p. 116, &c.; *Einleitung in das Alte Testament*, von Eichhorn.)

ATKYNs, SIR ROBERT, a judge of the Court of Common Pleas during the reign of Charles II., and Lord Chief Baron after the revolution, was an eminent lawyer, distinguished for attachment to popular rights and for uprightness and independence of conduct during a period of judicial profligacy and subservency. He was descended from an ancient and opulent family in Gloucestershire; and it has been remarked as a singular circumstance, that for more than 300 years consecutively, some member of this family always presided in one of the superior courts of law. His father, Sir Edward Atkyns, was a judge of the Court of Common Pleas during the Commonwealth, and shared with Hale, Rolle, Wyndham, and other judges, the merit of the various improvements in the administration of the law which took place at that period. Immediately after the Restoration, Sir Edward Atkyns was named as one of the judges in the special commission for the trial of the regicides, and appointed a Baron of the Exchequer. He continued to hold the office of Baron of the Exchequer till his death, which took place in 1669, at the age of 82. Sir Robert Atkyns was born in 1621; he received the rudiments of his education at his father's house in Gloucestershire, and was afterwards entered at Balliol College, Oxford, where he spent several years. He was called to the bar in 1645 by the Society of Lincoln's Inn, of which his grandfather and father had been members. He was made a Knight of the Bath at the coronation of Charles II., and was returned to the first parliament of Charles II. for the borough of East Loos. He continued to hold his seat till he was raised to the Bench; and from the frequent mention of his name on committees, and in the general business of the House, he appears to have devoted much of his time to parliamentary duties. Long before his appointment to the Bench he had acquired extensive practice and a high reputation at the bar. In 1661 he was chosen recorder of Bristol; and in the early part of the year 1672 he was made a judge of the Court of Common Pleas, having been for some time before Solicitor-General to the Queen. In his judicial station he maintained his general character for learning and independence, though, from his language and conduct on the trials of the Jesuit priests and other persons charged with the Popish Plot in 1679, he appears to have partaken of the delusion which pervaded the country respecting that transaction.

In 1680 however the conduct of the court party, who were then preparing the way by the corruption of the judges for the introduction of arbitrary measures, drove him from the bench: but whether he was dismissed or resigned voluntarily is unknown. In 1682 he resigned the recordership of Bristol. Having taken part in a civic election there, the proceedings of which were alleged to be irregular, the virulence of party-spirit led the mayor and corporation, who were violent opponents of Sir Robert Atkyns, to indict him, with two other persons, for a riot and conspiracy. He was tried at the Bristol assizes and found guilty; but on moving the case into the court of King's Bench, judgment was arrested upon a technical error in the indictment. But the party object was effected, for Sir Robert immediately resigned his recordership.

On leaving the bench, Sir Robert Atkyns withdrew from all public occupation to his seat in Gloucestershire, where he lived for some years in great seclusion. It is clear however from his writings, that during his retirement he viewed with deep interest the political tran-

sactions of the time; and he cannot be supposed to have been indifferent to the desperate course which the government were pursuing. In 1683, when the memorable trial of Lord William Russel took place, Sir Robert Atkyns furnished the accused with a detailed note of such points of law and fact as he might legally and prudently insist upon on his trial. After the revolution he published two pamphlets, entitled 'A Defence of Lord Russel's Innocency,' in which he argues against the sufficiency of the indictment and the evidence, and justifies the reversal of the attainder, with great force of language and solidity of reasoning. In 1689 he published a tract, entitled 'The Power, Jurisdiction, and Privilege of Parliament, and the Antiquity of the House of Commons, asserted.' The occasion of this tract was the prosecution of Sir William Williams by the attorney-general, for having, as speaker of the House of Commons, and by express order of the House, directed Dangerfield's 'Narrative' to be printed. The object of Atkyns's argument, which displays much research and great legal and historical learning, was to show that this was entirely a question of parliamentary jurisdiction, of which the Court of King's Bench ought not to take cognisance. The statement of Howell ('State Trial,' xiii. p. 1380), that Sir Robert Atkyns personally argued the case for the defendant, is undoubtedly a mistake.

In the reign of James II. he composed another legal argument, the subject of which was the king's power to dispense with penal statutes, and which was suggested by the well-known case of Sir Edward Hales. In this treatise, he considers at large the doctrine of the king's dispensing power. It is clearly and candidly written, and the truth of the reasoning against the royal prerogative contended for by the judges in Hales's case will hardly be denied at the present day. Sir Robert Atkyns was returned to the only parliament called by James II., as representative of the county of Gloucester; but he does not appear to have taken any active part in the debates.

After the revolution, Sir Robert Atkyns received numerous marks of distinction. In 1689 he was appointed Chief Baron of the Exchequer, and later in the same year, he was chosen speaker of the House of Lords. During the long vacation in 1694, Sir Robert Atkyns, being then in his 74th year, retired from public life and took up his abode at his seat, Saperton Hall, near Cirencester, in Gloucestershire. He died early in the year 1709. In 1784 his published writings were collected into one volume, under the title of 'Parliamentary and Political Tracts.' By his second wife Anne, daughter of Sir Thomas Daeres, of Cheshunt, in Hertfordshire, he had a son, Robert, who was knighted upon a visit of Charles II. to Bristol soon after the Restoration, and who was the author of the 'History of Gloucestershire.' He died in 1711, aged 65.

ATTALUS, emperor of the West for one year, was born in Ionia, and brought up a pagan, but received baptism from an Arian bishop. He was a senator of Rome, under the reign of Honorius, and was sent by the Romans to that emperor at Ravenna, to represent to him the difficult situation of the capital, threatened at that time by Alaric, and to advise him to fulfil the conditions of a treaty which he had concluded with that Gothic chief. Honorius refused, and Alaric being joined by his brother-in-law, Ataulphus, laid siege to Rome, of which Attalus was then prefect. Alaric proclaimed Attalus emperor instead of Honorius, and required the Romans to swear allegiance to him, A.D. 409. On his coins he is called Flavius Priscus Attalus. After assuming the title he went with an army of Romans and Goths to besiege Honorius in Ravenna, when the emperor sent him messengers offering to associate him in the empire, but Attalus refused to listen to the proposals. Attalus however having opposed Alaric in some of his views, was immediately deposed by the Gothic chief. After this, Alaric again besieged Rome, took it, and gave it up to pillage in August, 410. Upon Alaric's death, Attalus accompanied his successor, Ataulphus, into Gaul. When, in 414, Ataulphus married Placidia, the sister of Honorius, in the town of Narbo, Attalus sang an epithalamium which he had composed for the occasion. Ataulphus seeing Honorius persisting in his hostility to him, proclaimed Attalus emperor once more; but his restored dignity was merely nominal. After the death of Ataulphus, his successor, Vallia, concluded peace with Honorius; and Attalus endeavoured to escape the emperor's vengeance, but was taken at sea in 416, and, by Honorius's order, banished to the island of Lipari, after having had the thumb and forefinger of his right hand cut off—a punishment with which he had threatened Honorius. (Zosimus; Orosius; Gibbon.)

ATTALUS I., king of a small but wealthy and populous country in the north-western part of Asia Minor, of which Pergamus (properly Pergamum) was the capital. The name of Asia was specially applied by the Romans to this country. Attalus was the son of Attalus, youngest brother of Philetærus, and cousin to Eumenes I., whom he succeeded A.C. 241. His mother's name was Antiochia, daughter of Achæus (Strab., 624). Before B.C. 226 he had extended his authority over the whole of Asia Minor, west of Mount Taurus (Polyb. iv. 48).

He first assumed the regal title after a victory over the Gauls, who had taken possession of that part of the country called after them Galatia (Liv.; Polyb.; Strabo). At the time when the Rhodians and inhabitants of Byzantium were preparing to make war on each other, in consequence of the Byzantines having imposed a tax on all vessels entering the Euxine (about B.C. 221), Attalus espoused the cause of the Byzantines, though he could be of no essential service, as he had

been defeated a little before by Achæus, and confined within the limits of Pergamus. Attalus still however continued the war with Achæus; and having taken into pay a body of the Gauls called Tectosages, he recovered several of the cities of Æolis, but was stopped in the midst of his victorious career by an eclipse of the sun (B.C. 218), which so alarmed the superstitious Gauls that they refused to advance any further. He left them on the Hellespont, and returned with his army to Pergamus. (Polyb. v. 77, 78.) We find him in alliance (B.C. 216) with Antiochus the Great, king of Syria, who was equally anxious with himself to get rid of Achæus (v. 107). In B.C. 208, he took part with the Ætoliæ against Philip of Macedon, and was appointed joint prætor of the Ætoliæ with their general Pyrrhus. He sent some auxiliaries, and towards the end of autumn made his appearance at Ægina with his fleet. Here he passed the winter; but as soon as the season permitted, he landed on the continent; and having taken the city Opus, the capital of the Locri Opuntii, with the consent of the Romans, who were also in alliance with the Ætoliæ, allowed it to be sacked by his soldiers. While he was employed here in collecting tribute from the surrounding chiefs, he was surprised by Philip, and only escaped by a hasty flight. Hearing that Prusias, king of Bithynia, had passed the frontiers of his kingdom, he left the Ætoliæ to their own resources, and returned to Asia. (Liv. xxvii. 30, 33; xxviii. 7.) Peace was soon afterwards concluded between the Ætoliæ and Philip, which was also acceded to by Attalus. When the Romans were ordered (B.C. 205), by an oracle from Delphi, to bring the Idæan Mother Cybele from Pessinus to Rome, it was to the king of Pergamus that an embassy was sent, and through his means the black stone representing the goddess was procured and conveyed to Rome (xxix. 11, 12). Peace however did not continue; for we find the Rhodians leagued with Attalus (B.C. 201) against Philip in the sea-fight of Chios. Attalus behaved with great bravery on this occasion; but having pursued a Macedonian vessel too far, he was forced to abandon his ship and escape by land. Philip afterwards besieged Attalus in Pergamus, but was forced to retire; and Attalus passed over to Athens (B.C. 200), where he was received with great honour, and renewed his alliance with that people. He joined the Romans with a considerable body of troops; and the confederates laid siege to Oreum, a strong city of Eubœa, which they took after an obstinate resistance. Attalus continued to assist the Romans against Philip, and (B.C. 197) he appeared in the assembly of the Bœotians, with a view of detaching them from the cause of Philip. In the midst of an eloquent harangue, which he was pronouncing with great force, he was seized with apoplexy; and though he lingered long enough to enable him to be conveyed to Pergamus, he died within a few weeks, in the seventy-second year of his age, having reigned forty-four years. (Liv. xxxi. 14, 46; xxxii. 8; xxxiii. 2, 21.) He left, by his wife Apollonia, four sons, Eumenes, who succeeded him; Attalus, who succeeded his brother Eumenes; Philætarus; and Athenæus.

Silver. British Museum.

ATTALUS II., named *Philadelphus*, was the second son of Attalus I. He was born B.C. 220, and succeeded to the throne of Pergamus on the death of his brother Eumenes (B.C. 159), as the son of that prince, also called Attalus, was of too tender an age to hold the reins of government. His first act was to restore Ariarathes to his kingdom of Cappadocia. (Polyb. xxxii. 23.) He pursued faithfully the policy of his family, in maintaining an intimate alliance with the Romans; and he was treated by them at all times with respect and confidence. Prusias, king of Bithynia, made an attack on the territory of Attalus (B.C. 156), and laid siege to Pergamus; but he was compelled by the threats of the Romans to desist, and to indemnify Attalus for the loss he had sustained. This war was however carried on for several years; the leading facts may be found in Appian's 'Mithridatic War' (c. 3-7; also Polyb. xxxii. 25, 26, xxxiii. 1, 6, 10, 11). Five years afterwards (B.C. 149) we find Attalus assisting Nicomedes against his father Prusias (Strab. xiii. 624). He lived to be eighty-two years of age, and during his latter years was so much under the influence of his minister Philopœmen, that the Romans used in jest to inquire from those returning from Asia whether Attalus was still the chief favourite of Philopœmen. (Plutarch, 'Mor.' p. 792.) He was the founder of Philadelphia in Lydia (Steph. Byz.), and of Attaleia in Pamphylia (Strab. xiv. 667), and a liberal patron of the arts: a kind of embroidered hanging or tapestry was invented by Attalus. (Plin. viii. 48.)

ATTALUS III., named *Philometor*, was the son of Eumenes II.

He succeeded (B.C. 138) to the throne of Pergamus on the death of his uncle, Attalus II.; but he is little known to us, except for the madness and extravagance of his conduct. After having murdered many of his friends and relations, he was seized with remorse, and inflicted on himself every sort of penance which the most gloomy superstition could invent. He finally gave up all care of public business, and devoted his time to sculpture and to gardening, with which he became so well acquainted, that he wrote a work on the subject, which is recommended by Pliny (xvii. 4), Varro ('R. R.' lib. i. 1), and Columella ('R. R.' lib. i. 1). Having engaged with great eagerness in the erection of a sepulchral monument to his mother Stratonice, daughter of Ariarathes, king of Cappadocia, he exposed himself to the violence of the sun's rays, was in consequence seized by a fever, and died, after a reign of five years, B.C. 133. In his will was the expression "bonorum meorum Populus Romanus hæres esto," thereby making the Romans the heir of his moveable property; but they insisted that it meant the kingdom of Pergamus. (Justin. xxxvi. 4; Diodor. Sic. xxxiv., vol. x. p. 122, ed. Bip.; Plin. xxxiii. 11.) The kingdom was claimed by Aristonicus, an illegitimate son of Eumenes II., and he bravely maintained the contest for some time; but at last, being defeated and taken prisoner, he was carried to Rome, and strangled in prison, B.C. 129. The kingdom of Pergamus thus became the Roman province of Asia. (Clinton, 'Fasti Hellenici,' vol. ii.)

ATTERBURY, FRANCIS, bishop of Rochester in the reigns of Queen Anne and George I., was born on the 6th of March, 1662, at Milton, near Newport Pagnel, in Buckinghamshire, of which parish his father was rector. He was educated at Westminster, and elected student of Christ Church, Oxford, in 1680. In the year 1687 he appeared as a controversial writer in an answer to 'Considerations on the Spirit of Martin Luther, and the Original of the Reformation;' a tract published under the name of Abraham Woodhead, an eminent Roman Catholic, but really written by Obadiah Walker, master of University College. Bishop Burnet, in his 'History of his own Times,' ranks this vindication amongst the most able defences of the Protestant religion. Atterbury himself, on his trial, appealed to this book to exculpate himself from the suspicion of a secret leaning towards popery. After taking his degree of B.A. in 1684 and M.A. in 1687, he bore some office in the university, and was tutor to Charles Boyle, afterwards Earl of Orrery, but complained of the narrowness of his sphere of action. In 1690 he married Catherine Osborn, a near relative of the Duke of Leeds. Having taken orders, Atterbury, in 1691, was elected lecturer of St. Bride's; in 1693 he was elected minister of Bridewell. His pulpit eloquence attracted general attention, and he was soon after appointed chaplain in ordinary to their majesties. His sermons on the 'Power of Charity to Cover Sin,' and 'The Scornor Incapable of True Wisdom,' involved him in controversies with Bishop Hoadley and others. In 1693 he became preacher at the Rolls chapel. In the same year appeared Mr. Boyle's 'Examination of Dr. Bentley's Dissertations on the Epistles of Phalaris and the Fables of Æsop.' Though this work was published under Boyle's name, it is shown by Bishop Monk ('Life of Bentley') that Atterbury had the chief share in the undertaking, and in fact wrote more than half the book. Whatever credit we may give Atterbury for ingenuity and humour, this work proves that he had not much learning.

In the year 1700 Atterbury engaged in a long controversy with Dr. Wake, afterwards archbishop of Canterbury, and others, concerning the rights, powers, and privileges of convocations, Atterbury denying the authority of the civil power over ecclesiastical synods. His style was acrimonious, and his wit and satire perhaps too freely indulged, but his zeal for the interests of his order procured him the thanks of the Lower House of Convocation, and the degree of Doctor in Divinity, without exercise or fees, from the University of Oxford.

On the accession of Queen Anne, in 1702, Atterbury was appointed one of her chaplains in ordinary, and in 1704 advanced to the deanery of Carlisle. His characteristic impatience broke out remarkably on this occasion. He took out his instruments before his predecessor had resigned. Dr. Nicholson, compiler of the 'Historical Library,' who was then Bishop of Carlisle, required the preceding dean's resignation to be produced. When produced, it was found to be dated a month subsequent to Atterbury's collation, which was therefore void. Atterbury attempted in vain to obtain a clandestine alteration of dates, but was at length admitted to his deanery without this error of date being rectified.

In 1706 Atterbury was engaged in a dispute with Hoadley concerning the advantages of virtue with regard to the present life. In a funeral sermon he had asserted, that if the benefits resulting from Christianity were confined to our present state, Christians would be of the whole human race, the most miserable. Hoadley on the contrary, maintained, in a printed letter to Atterbury, that it was a point of the utmost importance to the Gospel itself, to vindicate the tendency of virtue to the temporal happiness of man. In 1707 Atterbury was made canon in the cathedral of Exeter. In the same year he was involved in a fresh controversy with Hoadley, concerning passive obedience. In 1710 Dr. Sacheverell's trial took place; and it is stated in Boyer's 'History of the Life and Reign of Queen Anne,' that the defence was generally thought to have been drawn up

by Dr. Atterbury, in conjunction with Dr. Smalridge and Mr. Freind. In the same year Dr. Atterbury was chosen prolocutor to the lower house of convocation. In 1712 he was made dean of Christ Church, Oxford; but owing to his imperious temper, discord soon broke out in the college, and his removal was thought necessary for the restoration of peace. In 1713, on Lord Oxford's recommendation, he was promoted to the bishopric of Rochester, and the deanery of Westminster. It has been generally thought that he aspired to the primacy, and that he probably would have attained it had a vacancy occurred during the queen's lifetime. Immediately on her death it is asserted that he proposed to Bolingbroke to attempt to proclaim James at Charing Cross; and offered himself to head the procession in his lawn sleeves. On the other hand it is said that he attempted to gain the good graces of George I.; but that his overtures were rejected with marks of personal dislike. Certain it is, that from this time he assumed a position of hostility to the House of Hanover, and that all his energies were directed to bring about the restoration of the Stuart dynasty. At the breaking out of the rebellion in 1715 the other prelates published a declaration of abhorrence of it, but Atterbury on the plea of its containing certain reflections on the High Church party, refused his signature. In the House of Lords, he drew up some of the most violent protests against the measures of the court and ministry. Thus far his opposition was not unconstitutional; but he soon after incurred the suspicion of being deeply concerned in a succession of plots for the restoration of the ejected family. The report of a secret committee of the House of Commons charged him with a treasonable correspondence, for the purpose of raising insurrection in the kingdom, and procuring invasion from abroad. The evidence against him was decisive, but the ministry hesitated for three months before issuing their warrant (August 24, 1722) for his committal to the Tower. On his appearance before the council he behaved with calmness and self-possession. The imprisonment of a bishop caused much excitement, which was no doubt greatly increased by the unnecessary harshness with which he was treated in the Tower. In the course of the ensuing March, a bill of pains and penalties against him was brought into the House of Commons. Atterbury raised a difficulty about appearing either in person or by counsel; and this point of privilege was warmly debated in the Upper House, but to his vexation it was decided that the bishop being not a peer of the realm, but only a lord of parliament, might make his defence before the Commons without any detriment to the honour of the peerage. He however acquainted the Speaker by a letter, that he would give the Commons no trouble, but make his defence in another house, of which he had the honour to be a member. The bill passed the Commons without a division. On the first reading in the Lords, the bishop on his passage to Westminster was insulted by the mob; but a guard was appointed for his future protection, and for the remainder of the week, through which the preceding lasted, the populace was softened into pity. His speech in his own defence was both argumentative and eloquent; his demeanour was firm and collected. After a long and warm debate, the bill was passed by a majority of 83 to 43. It received the royal assent on the 27th of the same month, May. This affair at the time excited the vehemence of party, but the dispassionate view of the case seems to be, that the bishop was really guilty of the political offence laid to his charge, but that proofs neither sufficiently strong nor strictly legal could be adduced, and that the proceeding was in its nature dangerous and unconstitutional. A strong protest was entered on the Journals of the Lords. ('Historical Register,' and 'Debates of the House of Lords.')

The bill condemned him to deprivation from all his ecclesiastical preferments, incapacitated him from performing any spiritual functions or holding any civil appointment, and sentenced him to perpetual exile. Accordingly in June 1723 he quitted England for Calais, accompanied by his daughter, Mrs. Morrice, who was allowed to attend him on his travels; and, through the hands of her husband, he was permitted to maintain an intercourse by correspondence with his native country. After a short stay at Brussels he settled finally at Paris, where he resided till his death, softening the severity of his banishment by study, conversation, and correspondence with his old friends Swift and Pope, and other eminent and learned men. In a collection of the bishop's original letters, furnished by M. Thiriot, there is much able criticism on several French authors. His avowed wish now was to live to himself and a few friends, but he in fact, for three or four years, was the real though covert manager of the Pretender's business. He was consequently deeply implicated in the schemes for raising another rebellion in the Highlands of Scotland, and other equally abortive measures. But Atterbury was too plain-speaking a man, and too conscientious a Protestant, for James; and the incapable favourites of that weak and bigoted prince found little difficulty in undermining his influence. A letter, dated June 16, 1727, is extant in which the bishop, with a grave and sorrowful dignity, refers to his loss of favour, and requests permission to "retire from that share of business with which it has been hitherto thought not improper to intrust me." The death of George I. however led to his deferring his resignation to the following year, when he removed to Montpellier. Subsequently James seems to have become aware of the error he had committed in alienating from his service the most able man of his party, and he in 1730 succeeded in inducing him to return to Paris. But Atterbury's spirits

had been broken by the death of his daughter, who had gone to France to see him, October 1729; and if he had retained more of his old vigour, the state of European politics would probably have prevented him rendering any effectual services to the Pretender's cause. His feelings of desolation and hopelessness are strikingly shown in a letter to James, dated November 12, 1731. Atterbury died at Paris on the 15th of February, 1732. He was buried privately at Westminster Abbey; and no little public outcry was caused by the government having caused his coffin to be opened and searched for Jacobite papers which they asserted they had reason to believe were concealed in it.

Atterbury has been somewhat absurdly charged, on the strength of an improbable anecdote which Dr. Maty says Lord Chesterfield related to him, with having been, at least in early life, a sceptic; but the whole tenor of his conduct, and every reference in his private as well as public writings, contradict such a supposition. He was a worldly-minded and ambitious man, but that he firmly believed the religious truths which he so eloquently defended there can be no reasonable doubt. His chief purpose was plainly to raise himself to a high position in the Church, but it was as plainly for the sake of the Church (considered as an ecclesiastical corporation), of which he was ever the ardent and untiring advocate and resolute champion. The conduct of Atterbury with reference to the Stuart dynasty is the great blot on his public career, and though perhaps illegally convicted, he was undoubtedly guilty of the treason for which he was condemned. But he was sincerely devoted to the Stuart dynasty, and it was for no selfish ends he adhered to its desperate fortunes. Nor was his conduct wholly inconsistent with his position as a prelate of the English Church. The plan on which he had fixed his hope of securing the restoration of the Stuarts was that of inducing James to educate his son in the Protestant faith: an absurd expectation undoubtedly, but it was characteristic of Atterbury to overlook obstacles when he had set his heart on accomplishing a great purpose. In private life the haughtiness and asperity of the politician and controversialist wholly disappeared, and no man ever succeeded in winning a more affectionate attachment from friends as well as relations. As a preacher, a speaker, and a writer, he had few rivals; and Lord Mahon ('Hist. of Eng.,' c. xii.) hardly exaggerates his literary merits when he says that "few men have attained a more complete mastery of the English language than Atterbury; and all his compositions are marked with peculiar force, elegance, and dignity of style."

ATTICUS, T. POMPONIUS, was descended from a very ancient family, which formed one of the chief ornaments of the equestrian order. He was born on the 9th of March, B.C. 109, being three years before Cicero and Pompey, and nine years before Cæsar. He is sometimes called Q. Cæcilius (Cic., 'Ad Att.,' iii. 20), a name which he derived, B.C. 58, from his maternal uncle Cæcilius, who left him a considerable estate. His early years were spent under the direction of his father, whose taste for literature induced him to give his son the best education which Rome could supply. He lived during the most stormy period of Roman history, but he early came to the determination to sue for no public honours, and to take no side in party or political strife. He thus contrived to retain the friendship of the various parties which in succession directed public affairs. He was on good terms with Sulla, and with the younger Marius, with Cæsar, Pompey, M. Brutus, Cassius, Antony, and Augustus; but his most intimate friend was Cicero, with whom he seems to have kept up a constant correspondence from the year B.C. 68 down to Cicero's death. We still possess the letters of Cicero to Atticus, in sixteen books, one of the most valuable records of that important period. Atticus spent a considerable portion of his life at Athens (from B.C. 85 to 65), having withdrawn from Rome that he might not be forced to take any part in the first civil war: it is probable that he derived the name of Atticus from his residence at Athens. Atticus had also an estate in Epirus, near Buthrotum, where he appears to have spent a considerable part of his time. He returned to Rome B.C. 65; and there, as at Athens and Buthrotum, his days were spent in the delights of literary retirement. He married at a late period (Feb. 12, B.C. 56) Pilia, of whom we know nothing more than the name (Cic., 'Ad Att.,' iv. 4), and that her health appears not to have been very good. His daughter Pomponia (called by Cicero also Cæcilia and Attica) married M. Vipsanius Agrippa, the intimate friend and able minister of Augustus; and his grand-daughter by this marriage, Vipsania Agrippina, was married to Tiberius Claudius Nero, afterwards emperor, by whom she had Drusus. After Vipsania was divorced from Tiberius she married Asinius Gallus, by whom she became the mother of a numerous family. Pomponia, the sister of Atticus, was married to Cicero's brother Quintus, but the marriage was not a happy one.

Atticus died March 31, B.C. 32, at the age of 77, of voluntary starvation, after he found that a disease with which he was seized was incurable. None of his works have been preserved. He wrote annals which included a period of seven centuries; and though they referred principally to the history of Rome, he gave in them an abridged account of several of the more celebrated nations of antiquity. He was particularly happy in the composition of short epigrammatic inscriptions to be placed under the busts of illustrious men. He wrote also a history of the Consulate of Cicero in the Greek language, in a plain unadorned style. (Cic., 'Ad Att.,' ii. 1.) In his philoso-

phical opinions Atticus belonged to the Epicurean sect, as we see from various passages in Cicero's 'Letters;' and, conformably to the views of this sect, he avoided the troubles and the cares of public life. He inherited from his father great wealth, and he knew well how to increase it. His equestrian rank enabled him to hold a share in one or more of those lucrative societies which farmed the public revenues. He engaged also in mercantile pursuits, and he had a great number of well-educated slaves, who served him as amanuenses and transcribers of books, which he sold to the public.

(Held, *Prolegom. ad Vitam Attici quæ vulgo Corn. Nepoti adscribitur*, Vratislav., 1826; *T. Pomp. Atticus, Eine Apologie*, Eisenach, 1784; Hisely, *De Fontibus Corn. Nepotis*, Drumann, Rom. v. V.)

A'TTILA. This formidable conqueror was the son of Mundzukun, and nephew of Roas, a king or leader of the Huns, who at the beginning of the 6th century was established with his hordes in Pannonia, on the south bank of the Danube. Attila and his brother Bleda succeeded Roas about A.D. 430. The first act of their reign was to conclude a peace with the Emperor Theodosius II., on terms disgraceful to the majesty of the Roman empire. Being thus at liberty to pursue their conquests in the north, Attila and Bleda extended their dominions from the Danube eastward to the Volga, and northward even to the Baltic. violation of existing treaties, to cross the Danube; and they led an irresistible force through Mœsia into Thrace and Macedonia, on their way a doubtful provocation, or an unscrupulous ambition, urged them, in defeating on three occasions the forces of the Eastern empire. The whole coast of the Archipelago, from Thermopylæ to Constantinople, was exposed to their ravages; and Theodosius in alarm retired into Asia. In 445 Attila procured the assassination of his brother and coadjutor Bleda, and in 446 Theodosius was forced to consent to terms of peace still more humiliating than before, ceding the tract along the banks of the Danube extending to the breadth of 15 days' journey, and consenting to the payment of an increased tribute. In 448 the historian Priscus accompanied ambassadors sent to apologise to Attila for the non-fulfilment of some articles of this treaty; and we derive from him some account of the domestic manners of the Huns. The palace of Attila, which was situated in the plains of Upper Hungary, was entirely of wood: the houses of the Huns were of the same or some meaner material, and the only stone building was a set of baths erected by the king's favourite Onegesius. But the wood was fashioned into columns, carved and polished; and the ambassadors could discover some evidence of taste in the workmanship, as well as barbarous magnificence in the display of the rich spoils of more civilised nations. Around the palace a large village had grown up. The ambassadors were invited to a sumptuous entertainment, at which the guests were all served in silver and gold: but a dish of plain meat on a wooden trencher was set before the king, of which he partook very sparingly. His beverage was equally simple and frugal. The rest of the company were excited into loud and frequent laughter by the fantastic extravagances of two buffoons; but Attila preserved his usual inflexible gravity. A secret agent in this embassy was charged with the disgraceful task of procuring the assassination of this formidable enemy. Attila was acquainted with the real object of the mission; but he dismissed the culprit, as well as his innocent companions, uninjured. The emperor Theodosius was compelled however to atone for his base attempt by a second embassy, loaded with magnificent presents, which the king of the Huns was prevailed on to accept, and he even made some concessions in return. Theodosius died not long after (July 450) and was succeeded by the more virtuous and able Marcian.

Attila at this time was collecting an enormous army, and threatened both divisions of the Roman world. To each emperor he sent the haughty message, "Attila, my lord and thy lord, commands thee to prepare a palace for his immediate reception." To this insult was added a demand upon Marcian for the arrears of tribute due from the late emperor Theodosius. Marcian's reply was in the same laconic style, "I have gold for my friends, and steel for my enemies." Attila determined to make war first on the emperor Valentinian. The pretext for hostility was this. Valentinian's sister Honoria, who was confined in Constantinople in consequence of some youthful errors, had maintained a secret correspondence with Attila, and sent him a ring in token of her affection. It now suited him to demand her hand, with half the western empire as her dowry. The demand was refused, and Attila professed to be satisfied by the reasons assigned: but he did not the less turn his arms against Gaul. Beginning by craft what was to be carried on by violence and terror, he agreed to give assistance to the son of Genseric, king of the Vandals, in attacking Theodoric, king of the Goths. Assuring Valentinian that his warlike preparations were levelled against Theodoric only, he at the same time exhorted Theodoric to join him against the Romans, as their common foe. Meanwhile, he marched through Germany without halting till he reached the Rhine, where he defeated the Franks, cut down whole forests to build boats, and passing the river entered Gaul, several cities of which opened their gates to him, on his professions of friendship to the Romans. He soon threw off the mask. The calamities attendant on this invasion have been described in frightful colours by Sidonius, a contemporary, afterwards bishop of Clermont, and by the historians of France. The approach of the Romans and the Goths, under the command of Ætius and Theodoric, compelled him to make

a hasty retreat from the siege of Orleans. The combined army came up with him in the extensive plains surrounding Châlons-sur-Marne, a country well adapted to the cavalry of the Huns. There took place the last great battle ever fought by the Romans, and one of the most sanguinary contests recorded in history. Theodoric was slain. Attila was defeated and forced to retreat; he moved slowly to the Rhine without molestation, and retired into Pannonia in 451.

After having reinforced his army, he returned to repeat his demand of the princess Honoria in the plains of Italy. He mastered the unguarded passes of the Alps, and advanced at once to Aquileia, the metropolis of the province of Venetia, which he invested, and utterly destroyed after a siege of three months. Verona, Mantua, Cremona, Brescia, and Bergamo underwent the same fate. It has been conjectured that Venice owed its origin to the inhabitants of the mainland taking refuge from his ravages on the islands in the Delta of the Po. Milan and Pavia, Attila treated with unusual clemency: he neither fired the buildings nor massacred the inhabitants. From Milan he proposed to advance upon Rome: but as he lay encamped on the banks of Lake Benacus, he was approached by a supplicatory embassy, led by Avienus and Pope Leo I. [AVIENUS.] He received them with kindness and respect, and consented to a truce with Rome, the duration of which was to depend either on the fulfilment of his claims on the princess Honoria, or the payment of a proportionate ransom. Attila's troops, inured to the rigours of a northern climate, and the rude simplicity of a pastoral life, began to melt away in the luxurious plains of Italy: and the great Ætius, unable to oppose his progress, still hung on his march with a constant hostility. In these circumstances he deemed it prudent, on the signature of the treaty with Rome, to retire beyond the Danube.

The death of Attila took place in 453. The commonly received account is that given by Jornandes, that he died by the bursting of a blood-vessel on the night of his marriage with a beautiful maiden, whom he added to his many other wives; some, with a natural suspicion, impute it to the hand of his bride. Priscus observes, that no one ever subdued so many countries in so short a time. The vanity of the Romans refused to honour Attila with the title of king; they only styled him general of their armies, disguising an annual tribute under the specious name of military pay. His portrait, given by Jornandes, presents the genuine features of the Mongolian race: he was low in stature, broad-chested, and of powerful frame—dark-complexioned, with a few straggling hairs in the place of beard—with a large head, flat nose, and small eyes. His carriage was fierce and haughty; and no one could behold him without concluding that he was sent into the world to disturb it. It was a saying of his own, that the grass never grew on a spot where his horse had trod. His empire was overthrown and disjoined immediately upon his death, by the disputes and dissensions of his sons and chieftains—the fate of most unwieldy empires hastily erected by violence.

(Jornandes, *De Rebus Geticis*, and Priscus, *Excerpta de Legationibus*, furnish the best ancient materials for the history of Attila. For modern compilations, see Buat, *Histoire des Peuples de l'Europe*, and De Guignes, *Hist. des Huns*: Gibbon, cc. xxxiv. and xxxv.)

ATTIRET, JEAN DENYS, called *Frère Attiret*, a French painter attached to the Jesuit mission at Peking, in the middle of the 18th century. He was born at Dôle, in the Franche-Comté, July 31, 1702, and was first instructed by his father, an obscure painter of Dôle. He completed his studies at Rome, whither he was sent by the Marquis de Broissia. After practising a short time at Lyon, he settled in Avignon, and became a lay-brother of the Jesuits of that place; and when, in 1737, the French Jesuits of Peking requested their brothers at home to send them a painter, Attiret undertook to go. In China, Attiret soon obtained the favour of the emperor Kéen-Loong, by presenting him with a picture of the Adoration of the Kings, which he ordered to be placed in one of his own apartments; he however expressed a dislike to the gloss of oils, and employed Attiret only as a water-colour painter. Attiret became an object of envy to his Chinese rivals from an order he received from the emperor to restore a painting in one of the inner apartments of the palace. This commission from the extreme inconvenience of the ceremonial etiquette, which clogged his every movement, was as disagreeable as it was honourable to the French painter. Attiret met also with many vexations from the Chinese court painters until he employed them to execute the secondary portions of his works, and conformed himself in some degree to the Chinese taste. Between 1753 and 1760 the emperor Kéen-Loong was at war with the Tartars on the north-western confines of his empire, and he commanded Attiret to join him, and prepare some designs to illustrate his triumphs. Attiret arrived at the seat of war in 1754, and made many accurate drawings of triumphs, processions, festivals, &c., from which he afterwards painted pictures, some of which were preserved in the palace, and shown only by special permission of the emperor. Attiret painted the emperor's portrait, and introduced into his drawings a great many portraits of Chinese officers, many of whom had to journey as much as 800 leagues merely for the purpose of being painted. Sixteen of these drawings were engraved in France, by various artists, on a large scale, and both prints and plates were sent back to China, a few impressions only being reserved for the royal family of France and for the Parisian library. They are defective in design, and it is

evident that Attiret and his coadjutors, the Jesuits, Castiglione and Sikelbar, paid too much deference to the taste of the Chinese to satisfy that of the Europeans. The emperor created Attiret a mandarin, but by his position as a Jesuit it was impossible for him to assume the distinction. He died at Peking, December, 17, 1768, aged 66, and the emperor gave 200 ounces of silver towards the expense of his burial. ("Extrait d'une Lettre du Père Amiot, du 1 Mars, 1769, de Peking, contenant l'éloge du Frère Attiret," &c., inserted in the 'Journal des Sçavans,' for June, 1771.)

ATTWOOD, THOMAS, an eminent musical composer, equally distinguished by his productions for the church, the chamber, and the theatre, was born in 1765, and commenced his professional education as one of the 'children of the Chapel Royal,' under Dr. Nares, and his successor Dr. Ayrton. On the change of his voice, and consequent retirement from the king's service, he was sent abroad by and at the expense of his patron, the Prince of Wales, for the purpose of completing his studies in the schools of Italy. At Naples he continued two years, and afterwards proceeded to Vienna, where he became a pupil of Mozart, with whom he formed an intimacy which led to a daily intercourse, and to the imparting not only the usual information, but also a knowledge of those deeper recesses of the art which seldom, if ever, is, or can be, communicated in the course of ordinary lessons. This happy result is manifest in all Attwood's secular compositions, and was recognised by the great master, who said—according to the report of Michael Kelly, the singer—"Attwood partakes more of my style than any pupil I ever had." (Kelly's 'Reminiscences'.)

Soon after his return to his native country, Attwood's royal patron made him one of his chamber musicians, an appointment however which he soon relinquished. On the arrival of the Duchess of York in this country, he became her 'musical preceptor;' and on the ill-fated marriage of the Prince of Wales (afterwards George IV.) he gave almost daily lessons in music to the princess. His conscientious performance of this duty subsequent to the public estrangement, gave offence to his patron, who for several years after made his resentment felt.

In 1795 he was elected organist of St. Paul's cathedral, and in the following year, on the death of Dr. Dupuis, he was appointed composer to the Chapel Royal. For the solemnity of the coronation of George IV., he was required officially to compose an anthem, when he produced 'The King shall Rejoice,' a grand work, which has since been heard and admired in all parts of the kingdom. This restored him to the favour of his early protector, who appointed him organist of his private chapel at Brighton. For the coronation of William IV., Mr. Attwood composed the anthem, 'O Lord, grant the King a long life,' another great work, and in all respects equal to the former. In 1837 he was, without solicitation, appointed by the Bishop of London to succeed Mr. Stafford Smith in the office of organist of the Chapel Royal. In March of the following year he died, and his remains were deposited in St. Paul's cathedral, under his own organ, with every honour that the church to which he belonged, the choirs of the Royal Chapel and Westminster Abbey, and the most distinguished members of his profession, could confer.

Mr. Attwood's compositions are numerous and of great merit. His glee and songs were, and many still are, very popular; and his cathedral works unite the elegance of the modern school with the becoming sobriety of English church music.

AUBENTON, D'. [D'AUBENTON.]

AUBER, DANIEL FRANÇOIS ESPRIT, was born at Caen on the 19th of January, 1784. He was educated with a view to his taking in due time the management of his father's business, that of a print-seller, at Paris. At the age of twenty he was sent to London for the purpose of acquiring commercial knowledge, but returned to Paris on the rupture of the treaty of Amiens. By this time he had conceived a strong dislike to commercial pursuits, but he did not relinquish them until his father's death, which occurred some fourteen years later. His leisure hours were however devoted chiefly to the study of music, his associates including a large number of eminent professional and amateur musicians. He soon became known in private circles by the composition of various short pieces for the violin, violoncello, and piano-forte. He is said by M. Denne-Baron to have composed about this period for his friend Lamare, the celebrated violoncello player, all the pieces which appeared under the name of Lamare. A concerto for the violin excited a strong sensation at the Conservatoire de Musique, where it was played by Mazas. Stimulated by the applause of his friends, M. Auber at length essayed the composition of an opera, which was played with success at the private theatre of the Prince de Chimay. But he had now become aware that his studies had been too superficial, and he placed himself under the tutelage of Cherubini with great advantage to his future style.

He made his first appeal to the public judgment in 1813 in a comic opera, in one act, entitled 'Le Séjour Militaire,' which was played at the Theatre Feydeau, but received so coldly that Auber did not again appear as a composer for several years. But the death of his father and severe reverses of fortune led him to adopt music as a profession, giving lessons on the piano whilst he set about the composition of another one-act opera for the Opera Comique. This was 'Le Testament et les Billets-Doix,' produced in 1819, and with no more success

than the former. But Auber could not now afford to refrain from composition out of ill-humour with the public; he therefore speedily made another venture in a three-act opera entitled 'La Bergère Châtelaine,' which was produced at the Opera Comique in 1820 with entire success. From this time every year at least one, often two, and sometimes three operas—varying in length from one to five acts—appeared from the pen of this prolific composer, and in almost every instance commanded a fair share of public applause. Several of his operas, as is well known, have ranked among the most popular of his time; and some, as the 'Muette de Portici' (Masaniello), 'Fra Diavolo,' and one or two others, have taken their place as stock pieces in the chief opera-houses of Europe.

From nearly the period of M. Auber's regularly devoting himself to his art, his works have been marked by a decided originality and brilliancy which have won for them general favour, except of course with those musical partisans who can only tolerate a particular school of composition. The culminating point of his genius perhaps, as regards sustained power, elevation, brilliancy, and breadth of style and effect, was attained in his 'Muette de Portici,' which was produced for the first time at the Grand Opera, Paris, in 1828. The works in which he has most successfully aimed to sustain his reputation as a composer of the higher order are—'Fra Diavolo' (1830), 'Gustavus III.' (1833), 'Lestocq' (1834), 'Le Domino Noir' (1837), and 'Haydee' (1847). But in the long list of works which followed the 'Muette de Portici' none perhaps have appeared which have not displayed the hand of a master, however unequal they may have been in conception, originality of thought, and artistic finish; and some are regarded by eminent musicians as even more decidedly works of genius, or more masterly in execution, than either 'Fra Diavolo' or 'La Muette'.

Auber has received a fair share of honorary as well as more substantial rewards. Besides those decorations which commonly fall to the lot of the more eminent savants and artists of the continent, he was elected in 1829 a member of the Institute, section of the Fine Arts; in 1842 he succeeded Cherubini as director of the Conservatoire de Musique; and during the reign of Louis Philippe he was director of the court concert.

(*Nouvelle Biographie Universelle*, where is a complete list of his works; Fetis, *Biographie des Musiciens*.)

AUBIGNÉ, MERLE D'. [D'AUBIGNÉ.]

AUBIGNÉ, THEODORE AGRIPPA D', the Huguenot historian of his time, was born on February 8, 1550, at St. Maury, in the province of Saintonge. The utmost care was bestowed upon D'Aubigné's education, and some very absurd stories are told by himself and others of his early proficiency in the Latin, Greek, and Hebrew languages. His father was a bold and turbulent Huguenot, and had been engaged in the conspiracy of Amboise. While conducting his son to Paris they passed through this town. Perceiving the heads of his brother conspirators still exposed over the gates, the elder D'Aubigné adjured his son "never to spare his head, in order to avenge those noble victims;" an exhortation which was not lost upon the son. After some time spent in the colleges of the capital, young D'Aubigné was obliged to fly from persecution. He succeeded in escaping to Orleans, where, in the ensuing siege, his father received a wound, of which he died. He was then placed for two years under the superintendance of De Beze at Geneva. Here, and afterwards at Lyons, he pursued a singular course of study, consisting of the Rabbins, Pindar, mathematics, and magic, the latter with the resolve of never making use of it. At the breaking out of the third civil war he engaged from his guardian, who had endeavoured to detain him, and joined the Huguenot bands, which, in 1567, had assembled in the south of France, and with whom he remained through 1568, enduring many dangers, resulting in fever which had nearly proved fatal.

When peace returned, love put poetry into his head, and awakened his scribbling propensities, but these again were put to flight by the massacre of St. Bartholomew. Soon afterwards he entered the service of the king of Navarre, the future Henry the Fourth. Thus installed at court, D'Aubigné rendered himself remarkable for his boldness, talent, oddity, and impertinence. He abounded in repartee—his hands were full of quarrels. He wrote a tragedy called 'Circe,' and seems to have excited some admiration but little friendship. As a partisan however, D'Aubigné was valuable, and as such Henry of Navarre both prized and used him. When war broke out D'Aubigné accompanied the armies, and even shared in the personal adventures of the prince. The king of Navarre had little wherewith to reward such service, and D'Aubigné took advantage of his familiarity with the prince to push his frankness to insolence: he vented his discontent in sarcasms, and at last wore out the patience of the best-natured of kings and companions. He quitted the service of Henry in 1577. Soon after he fell in love with Mademoiselle de Lezay, married her, and rejoined the king of Navarre, but the influence of his former enemies again drove him from court. In order to be avenged, he determined to turn Catholic if possible—a resolve that he ingeniously avows; and he betook himself to the perusal of the controversial writers of that party, among whom Bellarmin made most impression on him. The result of his efforts and studies was however to render him a firmer protestant than before. In 1587 we find D'Aubigné again in the service of Henry, and engaged at the battle of Contras. In the following year he was rewarded with the government of Mail-

lezaïs. He was however in a little time again at variance with Henry, embracing the party of the Huguenots, and openly preferring their interests to court favour. Nevertheless, when it was necessary to confide the cardinal of Bourbon to a trusty guardian, Henry selected D'Aubigné, notwithstanding the expostulation of his counsellors, adding, that D'Aubigné's word was a sufficient guarantee for his faith.

From the period of Henry's desertion of Protestantism, D'Aubigné was one of the firmest supports of the Huguenot interests. He asserts that the ruin of the Huguenots and the downfall of their cause were owing to the corruption of their chiefs; nor does he exempt Sully himself from this charge. As to D'Aubigné himself, one thing is certain, that he might have been rich, like his comrades, and that he was almost the only one who remained poor. His voice was always raised for Huguenot independence against the insidious proposals of the court. It was during his residence at Maillezaïs that he wrote his chief work, 'The History of his Own Times,' a valuable document for the Huguenots of France. It is a lively picture of passing events, feats of war, and intrigues of court, in which the characters of the personages concerned are sketched by a satiric but lively pen. The last volume was printed at Maillezaïs in 1619, and in the following year it was condemned by the Parlement of Paris to be burned. The publication increased the hatred of the queen to D'Aubigné. The ministry had made frequent overtures to purchase the possession of his fortress; and when at last he found it no longer tenable, he gave it up, not to the court, but to the chief noble of the Huguenot party, the Duke de Rohan. D'Aubigné then retired to Geneva, where he arrived in September 1620, and was most honourably received. He lived in exile ten years, during which he employed his time in study, in writing, and in directing the fortifications raised at that time around Berne and Basle, and other Swiss towns, as bulwarks of the Protestant interest. The French court ceased not to disturb and persecute him: according to his own statement they procured in all four judgments of death to be recorded against him; but he seems to have heeded them very little, and they were probably rather intended to prevent his return to Paris than to affect his life. His last years were embittered by the scandalous conduct of his son Constant, afterwards the father of the celebrated Mad. de Maintenon. D'Aubigné died in 1630, and lies buried in the church of St. René at Geneva: over him is a Latin epitaph written by himself.

The works of D'Aubigné are numerous and various. They consist of poems, dramas, controversial tracts, his great history, memoirs of himself, and various satirical writings against his contemporaries. Of these the principal are the 'Histoire Universelle depuis 1550 jusque à l'an 1601,' published in Paris 1616; the 'Histoire Secrète,' mentioned above; the 'Confession Catholique de Sieur De Sancy,' which is chiefly directed against De Sancy, finance minister, and Cardinal du Perron; and 'Les Aventures du Baron de Fœnesté.'

AUBREY, JOHN, born at Easton Piers, in Wiltshire, on March 12, 1625-6. He was the eldest son of Richard, only son of John Aubrey of Burleton, in Herefordshire. He received his education in the grammar-school at Malmesbury, under Mr. Robert Latymer, who had also been preceptor to Thomas Hobbes, with whom afterwards, notwithstanding disparity of years, Mr. Aubrey formed a lasting friendship. In 1642 he was entered a gentleman commoner of Trinity College, Oxford. Here he formed an acquaintance with Anthony à Wood, to whose collections for the history of the university and its writers he became a contributor ('Life of Wood,' prefixed to Bliss's edit. of the 'Athenæ Oxon.,' p. lx.), as well as to the 'Monasticon Anglicanum,' then recently undertaken by Dodsworth and Dugdale. By the death of his father, in 1652, he succeeded to several estates in the counties of Wilts, Surrey, Hereford, Brecknock, and Monmouth; and in his 'Miscellanies,' he acquaints us that he had also an estate in Kent. In 1656 he became one of the club of commonwealth-men, formed on the principles of Harrington's 'Oceana,' printed in that year. (Wood, 'Athen. Oxon.,' edit. Bliss, vol. iii. col. 1119.) The club however was broken up in 1659. In 1660 Mr. Aubrey went into Ireland, and upon his return, in the month of September that year, he narrowly escaped shipwreck near Holyhead. His notes inform us that he afterwards suffered another sort of shipwreck. He says, "On November 1, 1661, I made my first addresses in an ill hour to Joan Sommer." When he married is uncertain; but from this remark we gather that in that state he enjoyed no great felicity. In 1662 he became a Fellow of the Royal Society. In 1664 he was in France. His estates, between lawsuits and mismanagement—and perhaps, as Wood intimates, his own expensive habits—now became encumbered, and about 1666 he seems to have disposed of several. In the space of four years he was reduced not only to straits, but to indigence. Yet his spirit remained unbroken. "From 1670," he says, "I thank God I have enjoyed a happy delitescency." This obscurity, which he calls happy, consisted in following up the bent of his genius, while he owed his subsistence to the kindness of his friends; and in labouring to inform that world in which he knew not how to live. His chief benefactress was the then Lady Long, of Draycot, in Wiltshire, in whose house he had an apartment, and by whom he was generously supported as long as he lived. Dr. Rawlinson says ('Mem.,' p. xii.), "that he was on his return from London to Lady Long's house, when his journey and life were concluded at Oxford, where it is presumed

he was buried, though neither the time of his obit nor his place of burial can be yet discovered." The date of his death is variously stated at 1697 and 1700.

Anthony à Wood gives a peevish character of Aubrey, and says, "he was a shiftless person, roving and magotie-headed, and sometimes little better than crazed; and being exceedingly credulous, would stuff his many letters sent to A. W. with follies and misinformations which sometimes would guide him into the paths of error." ('Ath. Oxon.,' Bliss's edit. 'Life,' p. lx.) Hearne informed Baker, the Cambridge antiquary, that it was Aubrey who gave Wood that account of the lord chancellor Hyde, which chiefly occasioned the prosecution against him. Wood used to keep his vouchers. ('Ath. Oxon.,' iii. 644.) Aubrey was doubtless both credulous and superstitious; but he was honest and diligent, and if his anecdotes require to be read with critical distrust, there can be little doubt that he faithfully recorded what he heard, and his very credulity has caused him to preserve much which, if of no great value in itself, is curious as characteristic of the age, and often not devoid of interest on its own account. He was, it is said, regarded as one of the best naturalists of the day, but much of his natural history reads very oddly now; and he was for the time a not unskilful antiquary. His collections have proved of much service to antiquaries and literary commentaries.

Aubrey's published works are—I, 'Miscellanies,' 8vo, London, 1696; reprinted with additions, 8vo, London, 1721; and 8vo, London, 1784. II, 'A Perambulation of the County of Surrey,' begun 1673—ended 1692. Published by Dr. Richard Rawlinson, under the title of 'The Natural History and Antiquities of the County of Surrey,' begun in the year 1673, by John Aubrey, Esq. F.R.S., and continued to the present time, 5 vols., 8vo, London, 1719.

Dr. Bliss, in a note to Wood's Life prefixed to the 'Athenæ,' p. lx., gives a detail of the manuscripts which Aubrey deposited in the museum at Oxford. Most of the letters addressed to Anthony à Wood have been printed in 'Letters transcribed from the Originals in the Bodleian Library and Ashmolean Museum,' 2 vols., 8vo, Oxford, 1813. Appendix, No. iv.

AUBUSSON, PIERRE D', grand master of the order of St. John of Jerusalem, was born in 1423 of a noble French family, descended from the old viscounts of La-Marche. He served while yet very young in the imperial army in Hungary against the Turks, and from that time the prevailing idea of his mind seems to have been that of fighting the Mussulmans, who then threatened to overpower Christian Europe. D'Aubusson, having returned to France, was presented at court by his cousin Jean d'Aubusson, chamberlain of Charles VII., and became a favourite of the dauphin, afterwards Louis XI., whom he accompanied in his expedition to Switzerland in 1444, and was present at the battle of St. Jacob, near Basle. After some years he proceeded to Rhodes, when he entered the order of St. John of Jerusalem. He obtained a commandery, was afterwards made grand prior, and in 1476, on the death of the grand master Orsini, D'Aubusson was elected to succeed him. In May, 1480, a large Turkish army, said to be 100,000 strong, commanded by a Greek renegade of the family of Palæologi, landed on the island, and soon after invested the town, the fortifications of which D'Aubusson had previously strengthened in every practicable way. The greatest bravery was displayed on both sides. The Turks made the first assault on the 9th of June, but were repulsed. A second and general assault was made on the 27th of July, after the greater part of the fortifications had been levelled by a previous cannonade. Seven Turkish standards were already planted on the ramparts, and the Turks were pouring into the town, when D'Aubusson, attended by a chosen band of French knights, rushed to the spot, and after a desperate contest, in which he received five wounds, the Turks were driven out of the breach, and were pursued by the knights and the Rhodians towards their camp. The invaders soon after sailed away from the island. This, which was the first siege of Rhodes, lasted 89 days; the Turks lost 9000 killed, and carried away, it is said, 15,000 wounded. Mahomet II., greatly irritated at the failure of the expedition, was preparing to renew the attack in person, when he died at Nicomedia, in May, 1481. The Turkish succession was disputed between his two sons, Bajazet and Zizim; and the latter being worsted in fight, took refuge at Rhodes, where D'Aubusson received him with great honour, and afterwards sent him for safety to Bourgneuf, a commandery of the order in France. Bajazet made peace with the knights, and agreed to pay a yearly sum for his brother's maintenance. Pope Innocent VIII. demanded that Zizim should be intrusted to his guardianship; and D'Aubusson being obliged to comply, though unwillingly, the Turkish prince went to Rome in 1483, where he was treated with all attention. D'Aubusson, in reward for his compliance, was made a cardinal. It had been a long cherished object of D'Aubusson's to bring about a general league of the Christian princes against the Sultan, and the project seemed to be on the eve of accomplishment—D'Aubusson himself, despite his great age, having been appointed commander of the forces—when the mutual jealousies and discordant ambitions of the princes caused the frustration of the design. An ill-concerted attack on Mitylene failed. Other objects of vexation, both abroad and at

home, followed in succession, and D'Aubusson's last years were spent in a deep melancholy. He died at Rhodes, in July 1503, aged 80. There is a narrative in Latin of the siege of Rhodes, which is attributed to D'Aubusson, in the collection 'De Scriptoribus Germanis,' Frankfurt, 1602. Gulielmus Caorsinus has written also an account of the siege, printed at Ulm, 1496. Father Bouhours has written a life of Pierre D'Aubusson.

AUCHMUTY, GENERAL SIR SAMUEL, was the son of the Rev. Samuel Auchmuty, D.D., of New York, a minister of the Church of England, and was born in 1756. In 1776 Samuel entered the British army as a volunteer, in which capacity he served three campaigns under Sir William Howe, and was present at several actions, particularly those at White Plains and Brooklyn. He obtained an ensigncy in 1778. From 1783 to 1796 he was in India, and at the latter date had risen to the rank of lieutenant-colonel. He came to England in 1797, and in 1800 he was sent, with the rank of colonel, to take command of a force to be despatched from the Cape of Good Hope to attack the French posts at Kosseir and Suez, on the Red Sea. On arriving at Jidda, his command merged in that of General Baird, whom he found there at the head of the Indian army; but he was appointed adjutant-general, at first to that army, and afterwards to the whole British forces in Egypt. He remained in Egypt during 1801 and 1802, and in 1803, on his return to England, was honoured with the Grand Cross of the Bath. In 1806 Sir Samuel Auchmuty was ordered to take command of the British troops in South America, with the rank of brigadier-general. On his arrival he found affairs in a critical position, the main body of the troops already on the spot being shut up in Buenos Ayres, on account of the recapture of that city by the Spaniards. He landed on the 5th of January, 1807, on the island of Maldonado, of which possession was still kept by the remnant of the British forces. Seeing the necessity of instant action, he determined on the attack of Monte Video, a city so well fortified that it was often called 'the Gibraltar of America.' The whole of his force, amounting to 4800 men, was accordingly landed near the city on the 18th of January, and on the 20th it sustained an attack from a well-appointed Spanish force of 6000 men, which was repulsed with great loss to the Spaniards. Regular siege was then laid to Monte Video, and a breach effected, notwithstanding the great strength of the works, which mounted 160 pieces of cannon. Intelligence arriving that 4000 men and 24 pieces of cannon were approaching for the relief of the place, the general determined on an immediate assault, which, on the morning of the 3rd of October, was made with complete success. The British loss amounted to 600; on the side of the Spaniards there were 800 killed, 500 wounded, and 2000 taken prisoners. After this brilliant action little more was done by Sir Samuel Auchmuty until he was superseded, on the 9th of May, by General Whitelocke, whose incapacity caused the loss of the advantages which his predecessor had gained. For the taking of Monte Video, Sir Samuel received the thanks of both houses of parliament.

In 1810 Sir Samuel Auchmuty sailed again for India as commander-in-chief in the presidency of Fort St. George, and in 1811 he commanded the troops at the reduction of the island of Java. For this service also Sir Samuel received the thanks of both houses. In 1813 he returned to England, and was made lieutenant-general in the army, but he was not afterwards engaged in active service. He died suddenly, in the Phoenix Park, Dublin, on the 11th of August, 1823, in his sixty-sixth year. At the time of his death he was commander of the forces in Ireland.

(Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge*.)

AUDEBERT, JEAN BAPTISTE, was born in 1759, at Rochefort, in France. His father was a dealer in provisions for the supply of the shipping. Young Audibert, when seventeen years of age, went to Paris to study the arts of design and painting, and soon excelled as a miniature-painter, supporting himself honourably by his labours. In 1759, M. Gigot d'Orcy, receiver-general of taxes, who was distinguished by his taste for natural history, having had an opportunity of judging of the talents of Audibert, employed him to paint the most rare objects in his magnificent collection, and afterwards sent him to England and Holland, whence he brought back a great many drawings, which were used in Olivier's 'Histoire des Insectes.' These occupations gave a bias to Audibert in favour of natural history, which soon amounted to an ardent passion. He now undertook on his own account various important works, of which the first was 'Histoire Naturelle des Singes, des Makis, et des Galeopithecques,' 1 vol. large folio, with sixty-two plates, the figures coloured, Paris, 1800. The appearance of this work caused a great sensation among naturalists, for Audibert united in his own person the characters of painter, engraver, and author. The method he adopted of colouring the engravings of objects of natural history was also far superior to any former method. He may indeed be said to have invented a new mode, and to have carried it to the highest degree of perfection. He placed all the colours on one plate at once, instead of using as many plates as there were colours. He used oil instead of water colours, and also succeeded in printing with gold, varying his colours in such a manner as to imitate the most brilliant hues of the originals. In his 'Histoire des Colibris, des Oiseaux-Mouches, des Jacamars, et des Promerops,' 1 vol. large folio, Paris, the expression and position of

the birds are so perfect as to make them appear animated; and the descriptions, of which he is likewise the writer, are worthy of such a work. Two hundred copies only were printed in folio, in which the name at the foot of each figure is printed in gold; one hundred copies in large quarto; and only fifteen copies in folio, of which the whole text is printed in gold.

Scarcely were these works commenced before Audibert began to plan others—the history of Birds, of the Mammifera, and lastly that of Man. He had thus embarked out for himself work enough to occupy a long life; but in 1800 death carried him off in the forty-second year of his age. He had begun the 'Histoire des Grimpeurs et des Oiseaux de Paradis,' &c., 1 vol., and the publisher, M. Desray, who was in possession of his materials and the processes which he had discovered and employed, completed these two works in as perfect a manner as those which had been finished by the author himself. The text was edited by M. Vieillot, a naturalist, and friend of Audibert. These two works are united under the common title of 'Oiseaux Dorés ou à reflets Métalliques,' 2 vols. in large folio and large quarto, Paris, 1802. Upon the same plan, and by the adoption of the same processes, M. Vieillot published 'l'Histoire des Oiseaux de l'Amérique Septentrionale.' The Birds of Africa ('Les Oiseaux d'Afrique') of Le Vaillant are indebted for their excellence to Audibert, who superintended the printing of the plates as far as the thirteenth part. Other branches of natural history, and especially botany, were enriched by the discoveries of Audibert, as may be seen in the splendid works 'Le Jardin de Malmaison,' by Ventenat, and the 'Liliacées' of Redouté. (*Biog. Universelle*.)

AUDLEY, or AUDELEY, SIR JAMES, one of the original knights or founders of the Order of the Garter, appears to have been the son of a Sir James Audeley, or de Audele, who served in the expedition to Gascony in 1324, and in that to Scotland in 1327. He accompanied Edward, the Black Prince, to France in 1346. Various incidental notices in Froissart and other contemporary authorities, show that Audley was frequently in personal attendance upon the Black Prince, at various times between the above date and that of the battle of Poitiers, in which his gallant conduct was eminently conspicuous. In recording the preparations for that great battle, Froissart relates that Sir James Audley so soon as he saw that the armies must certainly engage, requested permission to quit the prince, in order that he might, in fulfilment of a vow which he had formerly made, stand foremost in the attack, and either prove himself the best combatant in the English army, or die in the attempt. His request being granted, he, with his four squires, performed prodigies of valour throughout the battle, and he received numerous severe wounds in the course of the day. Towards the close of the engagement his squires led him out of the fight, and laid him under a hedge to dress his wounds; and when it was over, he was, by the prince's request, borne in a litter to the prince, who immediately, as a reward for his gallant bearing retained him as his own knight, giving him an annual revenue of 600 marks, and declaring him the bravest knight on his side of the battle. On returning to his tent, with chivalric disinterestedness, Audley resigned his annuity to his attendant squires; but when this act of generosity was made known to the prince, he sent for Audley, and bestowed upon him a further annual sum of 600 marks, for his own use.

On the renewal of warlike proceedings in 1359, Audley was again engaged in various sieges and other military operations. During the expedition of the Black Prince into Spain, Audley was appointed governor of Aquitaine; and in 1369 he filled the high office of seneschal of Poitou. Among other engagements of that year, he took part in the capture of La-Roche-sur-Yon, in Poitou, after which he retired to his residence at Fontenay-le-Comte, where he died before the close of the year. His funeral obsequies were performed with great ceremony at Poitiers, the prince himself attending on the occasion. On the formation of the Order of the Garter, about the year 1344, Audley was appointed one of the knights.

(Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge*.)

AUDLEY, THOMAS, LORD AUDLEY OF WALDEN, Lord Chancellor of England during the reign of Henry VIII. This nobleman is said to have been born at Earl's Colne, in Essex, but of his parentage or the events of his early life, we have little positive information. He is said to have received a university education, but whether at Oxford or Cambridge is uncertain; and the first circumstance which Dugdale could discover concerning him was, that in the eighteenth year of Henry VIII., about the year 1526, he became the Autumn-reader in the Inner Temple. Lloyd intimates that he gained reputation in this office by his reading on the Statute of Privileges, which, he says, commended him to the king's service. About three years later he was made Speaker of the House of Commons in that Long Parliament which, continuing by prorogation until the twenty-seventh year of the reign, effected the dissolution of all the smaller religious houses the revenues of which did not exceed 200*l.* per annum. In the twenty-second of Henry VIII., about 1530, he became attorney for the Duchy of Lancaster, an appointment which appears to have been given to him on the recommendation of the Duke of Suffolk, to whom he was steward or chancellor; and about the same time he was advanced to the dignity of a sergeant-at-law, and speedily

appointed king's sergeant. In 1532, upon the resignation of Sir Thomas More, he was knighted and made lord-keeper of the great seal; and on the 26th of January, 1533, he was made Lord Chancellor of England, an office which he held until within a few days of his death, when he resigned the seals. Audley presided at the trial of Sir Thomas More, was the Speaker of the Black Parliament, and was on all occasions the ready instrument of the arbitrary measures of Henry VIII. Respecting the rewards which he received for his servile and unscrupulous compliance with the king's will, Fuller quaintly remarks that "In the feast of abbey lands, King Henry VIII. carved unto him the first cut, and that, I assure you," he observes, "was a dainty morsel." It was the priory of canons of the Holy Trinity, commonly called Christ Church, near Aldgate, in the city of London, the site and precincts of which, together with all the plate and lands belonging to the establishment, were, shortly after his appointment to the chancellorship, bestowed upon Audley, who converted the priory into a residence for himself. Among other prizes he succeeded in securing for himself the great abbey of Walden, in Essex, after pleading "that he had in this world sustained great damage and infamy in serving the king, which the grant of that should recompense;" and having gained possession of this noble estate, he was created, by letters patent bearing date the 29th of November, in the thirtieth year of Henry VIII., 1538, Baron Audley, of Walden. He was also invested, in 1540, with the Order of the Garter. He died at his residence at Christ Church, and in 1544, according to the directions given in his will he was buried at Walden.

Audley is the reputed founder of Magdalen College, Cambridge, the patronage of which is vested in his representatives; but the college which bears that name was originally founded by Edward Stafford, duke of Buckingham, about the year 1519, under the name of Buckingham College. The institution was yet incomplete when, in 1521, it came into possession of the crown upon the attainder of Buckingham. In the 34th year of Henry VIII. (1542), Lord Audley entered into articles of agreement with the king, by virtue of which the college was regularly incorporated under the name of St. Mary Magdalen. Audley assigned certain lands and tenements formerly belonging to the priory of the Holy Trinity towards the support of the re-established college. Audley died without male issue, and consequently the barony became extinct. His daughter married, first, a younger son of the Duke of Northumberland, and subsequently Thomas, duke of Norfolk, by whom she had a son Thomas, who was summoned to parliament as Baron Howard of Walden, and who founded at Walden, upon the ruins of the abbey, the stately mansion of Audley-End.

(Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge*.)

AUDOUIN, JEAN VICTOR, was born at Paris on the 27th of April, 1797. His early education was intended to fit him for the law, but his inclinations were towards the study of organic nature, and he accordingly gave up the law for the study of medicine. His mind was early directed to the study of the natural history of insects. The first paper which he published was a description of an animal belonging to the class *Insecta*, in 1818, and from this date to the time of his death, his labours in this branch of study were incessant. The results of most of his investigations were published in the form of contributions to the various journals or in the *Transactions of societies*. These papers were numerous, and they are all valuable.

His early papers on the anatomy of the *Insecta*, and especially those on the *Annelida*, introduced him to the notice of Cuvier, Geoffroy St. Hilaire, and Latreille, with whom he lived on terms of intimacy, and from whose instruction he obtained those enlarged views of the relations of the animal kingdom which are so conspicuous in all his writings. In 1826 he became connected with M. Milne-Edwards in researches upon the *Crustacea* and *Annelida*, which resulted in a great addition to existing knowledge on the subject of the minute anatomy and functions of these animals. In the same year he became assistant to Lamarck and Latreille in the *Jardin des Plantes*, and on the death of the latter he was appointed professor of entomology in the museum attached to that institution. In his lectures here he paid particular attention to those insects which were injurious to vegetation. His investigation of the economy of insects was very extensive, and only a small portion of the matter he had collected was published before his death. He left behind him fourteen quarto volumes of manuscript on this subject, with numerous drawings. Audouin, at the request of the government of France, prepared and published a work, entitled '*Histoire des Insectes nuisibles à la vigne, et particulièrement de la Pyrale qui dévaste les vignettes des départements de la Côte-d'Or, de Saône-et-Loire, du Rhône, de l'Herault, des Pyrénées-Orientales, de la Haute-Garonne, de la Charente-Inférieure, de la Maine, et de Seine-et-Oise*.' It came out in six parts quarto. The first part appeared in 1840, but the last did not appear till some time after the author's death, in 1843. The work treats not only of the natural history of these insects, but also of the means of preventing their increase and of destroying them. It is illustrated with beautiful plates, after drawings by the author, and, whether regarded as an example of careful observation, and the application of science to a practical subject, or for the beauty of its illustrations, is probably one of the most valuable ever contributed to entomology.

Audouin fell an early victim to the pursuit of his favourite science.

In the summer of 1841 he visited the south of France, for the purpose of investigating the habits of the insects which injure the olive-plantations. Here he exposed himself to wet and cold, which brought on an attack of apoplexy, of which he died on the 9th of November, 1841. On the day of his funeral orations were delivered at his tomb by M. Serres, president of the Academy of Sciences; M. Chevrel, director of the Museum of Natural History; by M. Milne-Edwards, and M. Blanchard. Audouin had collected a fine museum, not only of individual insects, but of specimens illustrating their economy. These were exhibited after his death at the museum of the *Jardin des Plantes*. His library was large, and when sold by public auction at his decease realised 20,000 francs.

It would be unjust to regard him as a mere entomologist. He was a comparative anatomist and naturalist, whose power of acute observation peculiarly adapted him for the study of the habits and the structure of insects. In all his more important papers on entomology, it is evident that he did not regard insects as the end of his inquiries, but that he looked upon them as a great class of phenomena, illustrating the general laws that were deducible from the study of the whole animal kingdom. With him external forms were only regarded as dependent on an internal structure, which in its development, and the functions it performed, stood closely related to the whole animal kingdom. It was thus that he was led to investigate the annulose subkingdom of animals, and succeeded in adding to science so many important facts which assist in indicating the true relation of these animals to one or the other division of the animal kingdom.

(Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge*.)

AUDRAN, GIRARD, an eminent engraver, was born at Lyon, August 2, 1640. He learned the principles of design and engraving from his father Claude, who was one of a family of artists. At an early age he went to Paris, where his talents soon obtained notice, and procured him eventually the patronage of Le Brun, the king's painter, who employed him to engrave the *Battle of Constantine*, and the *Triumph of that emperor*. He subsequently resided two years at Rome, and improved himself in design in the school of Carlo Maratti. Among many fine plates which he executed at this period, a portrait of Pope Clement IX. excited particular admiration; and M. Colbert, a great patron of the arts, conceived so high an opinion of Audran's talents, that he persuaded Louis XIV. to recall him to France. On his return he was appointed engraver to the king, and in the year 1681 was nominated councillor of the Royal Academy. He died at Paris in 1703, aged 63 years.

Girard Audran was unquestionably one of the greatest historical engravers that has ever existed. His reputation perhaps rests chiefly on the celebrated series of plates after Le Brun's *Battles of Alexander*, respecting which the painter himself confessed that his expectations had been surpassed. It is indeed impossible to contemplate without the highest admiration the skill, intelligence, and extraordinary facility exhibited by his burin throughout those immense and intricate compositions. His style is composed of a bold mixture of free hatchings and dots, placed together apparently without order, but rendering, with admirable effect, not merely the contours, but the mind and feeling of the painter; and his style is so entirely free from manner, that on looking at his prints we lose sight of the engraver, and are reminded only of the master whom he is transcribing. In the above-mentioned *Battles of Alexander*, after Le Brun; the *Preservation of the young Pyrrhus*, after Nicholas Poussin; the *Plague*, after Mignard; and the *Martyrdom of St. Lawrence*, after Le Sueur, the respective style of each painter is rendered with the most distinct yet delicate discrimination. Girard Audran owed his extraordinary excellence not only to his consummate skill in design, but in a great measure to his frequent habit of painting from nature; and several subjects which he engraved from his own designs attest the extent and versatility of his powers.

He is also the author of a work on the proportions of the human figure, published in folio, under the following title, at Paris, in 1683: '*Les Proportions du Corps humain, mesurées sur les plus belles Statues de l'Antiquité*.' There is an English copy of it, which has gone through many editions; it contains a preface and twenty-seven plates of ancient statues, with the relative proportions of all the parts marked upon them.

AUDUBON, JOHN JAMES, an eminent American naturalist, was born in Louisiana, in the United States, on the 4th of May, 1780. Both his parents were French. His father, who was an ardent admirer of the beauties of external nature, endeavoured from his earliest years to foster in him a similar taste, and especially directed his attention to the many tribes of birds which inhabited that part of the state in which they resided. The boy's passion for the study of birds and everything connected with them, soon outran his father's promptings. While still a child he obtained possession of several of the splendid plumaged specimens of American birds, and cherished them as his choicest treasures. At this period, when any of his birds died, his chief regret was that he could no longer either himself retain what had been so bright, or convey to others a notion of the departed brilliance. His father having placed under his eyes a book of ornithological illustrations, the boy determined to become a draughtman himself.

Feeling his deficiency in the elements of drawing, he applied him-

which he exchanged in 1807 for that of theology. The popularity of his lectures, and the many valuable works which he published during his residence at Jena, not only induced the Duke of Saxe-Weimar to make him a member of his consistory, but other German universities made great efforts to draw him from Jena. In 1811 he accepted the chair of theology in the university of Breslau, to which he was invited by the Prussian government, and in addition to which he was honoured with a seat in the consistory of the province of Silesia. Augusti had now ample opportunities for displaying the practical character of his mind. His influence upon the university of Breslau, and upon all the educational establishments of Silesia, was very great. At the time when the French marched into Russia, Augusti was rector of the university; and it was owing to his intrepidity and patriotic spirit that the property of the university was saved. The Prussian government acknowledged its gratitude to him by various honourable distinctions. In 1819 Augusti was appointed chief professor of theology in the newly-established university of Bonn, and received the title of Councillor of the Consistory at Cologne. In 1833 he was placed at the head of the ecclesiastical affairs of the Rhenish province of Prussia by being appointed director of the consistory of Coblenz. Notwithstanding the numerous duties which this office devolved upon him, he still continued his lectures in the university until his death on the 23rd of April, 1841.

Augusti was one of the most voluminous theological writers of Germany. He was originally led by the influence of Griesbach to join the critical or philosophical school of theology, but this did not suit his natural bias, which was more inclined to maintain things as they are than to speculative investigations; and during the last forty years of his life he was a zealous, although not a bigoted, advocate of the established form of religion. In doctrine he may be considered an orthodox Lutheran. His writings, most of which are of an historical or archeological nature, are useful as works of reference; but they are deficient in elegance and simplicity of form, and contain more evidence of learning and industry than of the true spirit of an historian. The most important of all his works is the 'Denkwürdigkeiten aus der Christlichen Archæologie,' 12 vols. 8vo, Leipzig, 1817-31, which he subsequently condensed into a 'Manual of Christian Archæology.'

AUGUSTINE, ST., also called *Aurelius Augustinus*, Bishop of Hippo, and the most illustrious of the Latin fathers of the Church, was born at Tagaste, now called Tajelt, a small town in the inland part of Numidia, on November 13, A.D. 354. His father Patricius was originally a heathen, but embraced Christianity late in life; his mother Monica was a woman distinguished for her piety, who anxiously endeavoured to instil religious knowledge and habits into the mind of her son. At the beginning of his treatise, 'De Beatâ Vitâ,' Augustine speaks of his son, named Adeodatus, and of his brother Navigius; and in his 109th epistle, of a sister who died an abbess. He prosecuted his studies in his earlier years first at Tagaste, then at Madaura, and lastly at Carthage, where his morals became corrupted, and his illegitimate son Adeodatus was born in 371. The perusal of Cicero's 'Hortensius,' about the year 373, first detached him from his immoral habits; and about the same time he became not only a proselyte to the sect of the Manichæans, but for a short period a zealous and able defender of their opinions. In the meantime he acquired fame as a rhetorician, and taught eloquence successively at Tagaste, Carthage, Rome, and Milan. At Rome he left the Manichæans, and joined for a short time, as he himself informs us, the sect of the Academici. ('De Beatâ Vitâ,' tom. i. 212.) He arrived at Milan in 384, where St. Ambrose was at that time bishop, whose sermons, added to the tears and entreaties of his mother Monica, about 386, entirely removed the scepticism into which he had fallen, and effected Augustine's conversion. He was accordingly baptised by St. Ambrose in April 387, and his son Adeodatus, of whose remarkable genius he speaks with enthusiasm, was baptised along with him. Soon after this Monica, his mother, died at Ostia Tiberina. ('Confess.,' lib. ix., c. 10.) He now renounced his rhetorical pursuits, and devoted himself to the study of the Gospel, going first to Rome, but afterwards spent three years in seclusion at Tagaste, where he wrote several of his works.

Being at Hippo, Valerius, then bishop of that diocese, ordained him a priest early in 391; and at a council held there in 393 he displayed such learning and eloquence in defence of the faith, that the bishops who composed it were unanimously of opinion that he should be chosen one of their number. In 395 he became coadjutor to Valerius, and in 396 succeeded him in the sole rule of the bishopric of Hippo. He appears to have established about this time a kind of clerical community within his episcopal residence; and was still active in his opposition, not only to the heresies of the Manichæans, but to those of the Donatists and Pelagians. His great work, 'De Civitate Dei,' is believed to have been begun in 413, and finished about 426. In 418, after the general council held at Carthage, he produced his two works against the Pelagians, 'De Gratia Christi' and 'De Peccato Originali,' from the former of which he received the appellation of the 'Doctor of Grace.' His labours were continued both personally and by his pen to the close of life. One of his latest works was his 'Confessions,' which contains his admirably written autobiography.

In the latter part of his career Augustine had other enemies to contend with besides those of the Church. The Vandals had entirely overrun Africa, and passed even into Spain, and Augustine had now for his opponents the enemies of the empire. Carthage and Hippo made resistance for a considerable time; and St. Augustine, though pressed by his associates, refused to quit his flock and escape by flight. Still he saw the imminent danger to which Hippo was exposed; and, dreading that it would fall into the hands of the enemy, prayed to God that before that calamity happened he might be taken away. His prayer, it would appear, was answered, as he died during the third month of the siege, of fever, August 28th, 430, at the age of 76. The Vandals, who took Hippo in the year following, showed respect to his library, his works, and his body. Victor Vitensis ('Hist. Persec. Vandalicæ,' p. 6) says his library contained at that time 252 separate books or treatises on theological subjects, besides an exposition of the Psalter and the Gospels, and an innumerable quantity of homilies and epistles. The Catholic bishops of Africa carried his body to the island of Sardinia, the place to which they were driven by Thrasmond, king of the Vandals, in 500; and Luitprand, king of Lombardy, caused it to be conveyed, about or soon after 721, from Sardinia to Pavia. (Baronii 'Annales,' fol. Luca, 1738-56, tom. xii. p. 320.)

St. Augustine's works were numerous, and have been printed in a collected form repeatedly: at Paris, in 10 vols., folio, 1532; by Erasmus, from Frobenius's press, 10 vols., folio, 1540-3; by the divines of Louvain, 10 tom., folio, Lugl., 1586; and by the Benedictines of the congregation of St. Maur, 10 vols., folio, Paris, 1679-1700; 12 vols., folio, Paris, 1688-1703; and 12 vols., folio, Antwerp, 1700-3.

The commanding power which Augustine possessed over the minds of his contemporaries may be ascribed to some rare combinations which distinguished his own mind. With strong passion, he united mildness and humanity; with authority, much deference to the feelings of those over whom it was exercised; with a large expanse of intellect, perfect logical strictness. The same is the character of his writings. In the same work—often in the same page—we find him sublime and almost puerile, giving loose to the full stream of a rapid imagination and deep piety, and then arguing with African subtlety, or canvassing some minute scruple. He remained to the end of his life almost ignorant of Greek, and entirely so of Hebrew; and his theological acquirements were not profound. But his oral eloquence was of the most effective description, for it embodied the heat and earnestness of religious feeling, together with great rhetorical talents cultivated by a rhetorical education. His habits were simple and frugal, but without any affectation of austerity.

(*Acta Sanctorum*, vol. vi.; *Mémoires pour servir à l'Histoire Ecclésiastique*, by M. Lenoire Tillemont, 4to, Paris, 1702, the 13th volume of which is devoted to an elaborate account of his life and controversies; Lardner, *Credibility of the Gospel History*, part i. vol. vi. pp. 58 and 59, and vol. x. pp. 198-303; Neander, *Geschichte der Christlichen Religion und Kirche*.)

AUGUSTINE, ST., first archbishop of Canterbury, also by contraction called ST. AUSTIN, was prior of the Benedictine monastery of St. Andrew at Rome, where he had been educated under Gregory, afterwards Pope Gregory I. and St. Gregory. He is usually called the Apostle of the English, because he was sent, with about forty other monks, Italians and Gauls, to convert the Anglo-Saxons to the Christian religion. This mission was undertaken in the year 596, under St. Gregory's immediate direction, who had himself projected and undertaken the conversion of the Anglo-Saxons, previous to his advancement to the papedom. Augustine and his company soon felt disposed to return rather than take so long a journey to a country, with the manners and language of which they were unacquainted. Augustine was accordingly despatched back to Rome to obtain the Pope's leave for their return; but Gregory disregarded his remonstrances, and, providing him with new letters of protection, commanded him to proceed.

Augustine and his companions having passed through France, embarked for Britain, and landed late in 596 in the Isle of Thanet, whence they sent messengers to Ethelbert, king of Kent, to inform him of their arrival and of the object of their mission. Ethelbert's queen, Bertha, daughter of Cherebert, king of the Parisii, was a Christian; and by the articles of her marriage (as early as 570) had the free exercise of her religion allowed her. She had also a French bishop of the name of Luichard in her suite as chaplain, and had the use of the small church of St. Martin without the walls of Canterbury. Ethelbert ordered the missionaries at first to continue in the Isle of Thanet; but some time after came to them and invited them to an audience in the open air. Although he refused at first to abandon the gods of his fathers for a new worship, he allowed them to preach without molestation, and assigned them a residence in Canterbury, then called Dorobernia, which they entered in procession, singing hymns. Thorn ('Script.,' x. col. 1759) says they took up their residence in a street which has been since called Stable-gate, in the parish of St. Alphage. These missionaries, who now applied themselves to the strict severity of monastic life, preached jointly in the church of St. Martin, with the French Christians of Queen Bertha's suite. After the conversion and baptism of the king himself, they received license to preach in any part of his dominions, which

Bede assures us (c. 25) extended (probably over tributary kingdoms) as far as the river Humber; and proselytes were now made in remarkable numbers.

In 597, Augustine, by direction of Pope Gregory, went over to Arles in France, where he was consecrated archbishop, and metropolitan of the English nation, by the archbishop of that place; after which, returning into Britain, he sent Lawrence the presbyter and Peter the monk to Rome, to acquaint the Pope with the success of his mission, and to desire his solution of certain questions respecting church discipline, the maintenance of the clergy, &c., which Bede (l. i. c. 27) has reported at length in the form of interrogatories and answers. Gregory also, at Augustine's request, sent over more missionaries, and directed him to constitute a bishop at York, who might have other subordinate bishops, yet in such a manner that Augustine of Canterbury should be metropolitan of all England. He sent over also a valuable present of books, vestments, sacred utensils, and holy relics. He advised Augustine not to destroy the heathen temples, but only to remove the images of their gods, to wash the walls with holy water, to erect altars, deposit relics in them, and so gradually convert them into Christian churches, not only to save the expense of building new ones, but that the people might be more easily prevailed upon to frequent those places of worship to which they had been accustomed. He directed him further to accommodate the ceremonies of the Christian worship, as much as possible, to those of the heathen, that the people might not be too much startled at the change; and, in particular, advised him to allow the Christian converts, on certain festivals, to kill and eat a great number of oxen, to the glory of God, as they had formerly done to the honour of the devil. It is unnecessary to offer any remark on this mixture of pious zeal and worldly policy.

Augustine having fixed his see at Canterbury, dedicated a church which had been built in earlier times by some Roman Christians to the honour of Our Saviour; and King Ethelbert founded an abbey, dedicated to St. Peter and St. Paul, but afterwards called St. Augustine's. Augustine now made an attempt to establish a uniformity of discipline and customs in the island; and, as a necessary step, to gain over the British, that is, the Welsh bishops to his opinion. For this purpose a conference was held in Worcestershire, at a place since called Augustine's Oak, where the archbishop endeavoured to persuade the British prelates to make one communion, and assist in preaching to the unconverted Saxons; but neither this nor a second conference, in which he used much more peremptory language, and threatened divine vengeance in case of non-obedience, was successful. In the year 604, Augustine consecrated two of his companions, Mellitus and Justus, the former to the see of London, the latter to that of Rochester. He died at Canterbury, probably in 607, but the date of his death is variously given from 604 to 614. He was buried in the churchyard of the monastery which goes by his name, the cathedral being not then finished; but after the consecration of that church his body was taken up and deposited in the north porch, where it lay till 1091, when it was removed and placed in the church by Wido, abbot of Canterbury. (Thorn, 'Script,' x. col. 1793.) The observation of the festival of St. Augustine was first enjoined in a synod held under Cuthbert, archbishop of Canterbury (Gervase, 'Act. Pontif. Cantuar.,' Script. x. col. 1641), and afterwards by the Pope's bull in the reign of Edward III.

(Bede, *Historia Ecclesiastica*, lib. i. and ii.; Gregorius, *Epistolæ*, l. vii. ep. 5, 30, l. ix. ep. 56; Joan Diacon., *Vita S. Greg.*, *Vita S. Augustini*, auctore Gocelino Monacho; *Acta Sanctorum*, Mensis Maii, tom. vi. p. 378.)

AUGUSTULUS, the last emperor of the western portion of the falling empire of Rome, was the son of Orestes, a Pannonian of birth and wealth, who was secretary to Attila, and, on his death, entering the Roman service, rose, step by step, to its highest dignities by favour of the Emperor Julius Nepos. He returned the kindness of his patron by stirring to mutiny the barbarian troops in the pay of Rome. Nepos fled, and Orestes, instead of seizing on the vacant throne for himself, established his son upon it, A.D. 475, retaining however the substantial power in his own hands. The young emperor, who bore the lofty name of Romulus Augustus, possessed no qualities to distinguish him except personal beauty; and his character is aptly expressed by the diminutive title Augustulus, under which he is universally designated. He did not reign long, for within a year Orestes having offended the licentious barbarians by refusing to distribute among them a third part of the lands of Italy, the celebrated Odoacer, the first barbarian king of Italy, headed an insurrection, and Orestes was besieged in Pavia, taken, and put to death. The helpless and inexperienced Augustulus yielded at once, and Odoacer not only permitted him to live, but allotted for his abode the celebrated villa of Lucullus, on the promontory of Misenum, near Naples, with a pension of 6000 pieces of gold. Of his ultimate fate nothing is known. (Jornandes, *Rer. Get.*; Gibbon, c. xxxvi.)

AUGUSTUS is properly only a title of honour which was conferred upon the first emperor of Rome, and afterwards adopted by his successors. The meaning of the word seems to have been 'sacred,' as it appears to be derived from 'Augur,' the priest who gave the sanction of the gods to the persons of the Roman magistrates. The Greek writers interpreted the word by 'sebastos' (adorable), from 'sebas,'

adoration. But though the title was common to the emperors of Rome, it is in history generally limited to the first who held it, and is almost looked upon as his proper name. For this reason it will be convenient to give an account of that emperor under the present head, rather than under the names Octavius, Julius, or Cæsar.

Gold. British Museum. Diameter doubled.

Augustus, the first emperor of Rome, was the son of C. Octavius, and Atia, sister of the celebrated C. Julius Cæsar, who was consequently the great-uncle of Augustus. Augustus, or, to use his real name, Octavius, was born at Velitrae on the 22nd of September, B.C. 63, in the consulship of Cicero. In B.C. 60, his father was appointed as prætor to succeed C. Antonius in the government of Macedonia. He died immediately after his return from his province, leaving behind him Octavia the elder by his first wife Ancharia, and Octavia the younger, together with the son of whom we are treating, then only four years of age, by his second wife Atia, who afterwards married L. Marcius Philippus, the consul of B.C. 56. Philippus treated Octavius as a father, and superintended his education. He was inured to the manly exercises of the Roman youth, and his mind was disciplined in the best studies of the day. He showed from his early

Obverse.

Reverse.

Gold. British Museum. Diameter doubled.

years a great capacity, and the prudence and foresight which characterised his subsequent career. Young Octavius, at the age of twelve, pronounced a funeral oration on the decease of his grandmother Julia. (Quintil. xii. 6.) In his sixteenth year he received the toga virilis, and already in the year 46, we find him the object of Cæsar's regard, who in his African triumph, allowed him to share the military rewards given to his army, though he had not been present in the war. In the following year he was present with his great-uncle at the defeat of the sons of Pompeius near Munda; and during the remainder of Cæsar's life the education of the young Octavius seems to have been watched over by him with parental interest. Octavius was carrying on his studies at Apollonia, on the Adriatic, under Apollodorus of Pergamum, when he heard of the murder of his benefactor, and this

was soon followed by the information that he had been appointed his heir and adopted into the Julian family. He was only eighteen years of age, and his step-father, in his letters from Rome, strongly recommended him to keep away from public affairs; yet, after a little hesitation, he crossed over to Italy with his friend Vipsanius Agrippa, and was most favourably received by the legions at Brundisium. On the 18th of April he had already reached Naples (Cic. 'ad Att.' xiv. 10), and two or three days after, Cicero saw him at the house of his step-father. Antony at this period was beginning to lay aside the hesitation which marked his conduct in the first surprise of the Ides of March, and but for the arrival of young Octavius, the two parties would probably soon have brought the dispute to some decided issue. But the appearance of Octavius on the scene was the commencement of a series of intrigues which even the historian has found it difficult to unravel. The connection of Octavius with his murdered benefactor might naturally have led to an alliance with Antony; while, on the other hand, the marriage of his mother with Philippus brought him at once into contact with the chiefs of the opposite party. In this difficult situation a boy of eighteen played his part with an art which baffled the prudence of the oldest statesmen of Rome. Already at Naples, he persuaded Cicero that he was altogether devoted to his councils, and yet by assuming the dreaded name of Cæsar he threw out a hint which was well understood by the veterans and the people to whom that name was dear. No sooner had he arrived at Rome than he appeared before C. Antonius the prætor, and formally accepted the dangerous inheritance of the dictator's name and property, so that henceforward he was called C. Julius Cæsar Octavianus—the last epithet being added to mark his previous connection with the Octavii. By Roman usage an adopted son was in all respects on the same footing as a son born of a man's body, and accordingly Octavius after his adoption was the representative of the Dictator, and in the eyes of the Romans his true son.

The Dictator had left by his will a sum of money to each Roman citizen, and Cæsar declared his intention to pay the legacies and celebrate magnificent games. But Marcus Antonius, who affected to manage everything his own way, refused to give up the money or denied that he had it; he put obstacles in the way of realising the sums necessary for the payment of the legacies: he opposed the passing of a Lex Curiata, the object of which was to give to the adoption of Cæsar whatever legal sanction it might require; and he also prevented Cæsar from being elected a tribune. Cæsar celebrated, at his own expense, the games in honour of the completion of the temple of Venus, the ancestress of the Julian Gens; and dedicated a bronze statue of his uncle in the temple of Venus. The respect paid to the memory of the Dictator by his adopted son, and his cautious policy, gave him the advantage over his rival Antonius, with whom all parties were disgusted. Antonius and Cæsar were now using all their efforts to gain the advantage over each other; and the caution and prudence of the youth prevailed over his older rival. Many of the soldiers whom Antonius was about to lead into Cisalpine Gaul, went over to the side of Cæsar, including the whole of the fourth and the Martial legion. Cæsar had gone into Campania, where he got together a considerable force of veterans who had served under the Dictator. On his return to Rome, where he arrived before Antonius, he addressed the people, recapitulated the great deeds of the Dictator, spoke in modest terms of himself and attacked Antonius. He next set out into Etruria to raise more troops. Thus a youth at the age of nineteen, without any authority, and at his own expense, raised an army, with which he ventured to enter the city. The conduct of Antonius during this struggle for popularity was vacillating, and betrayed the want of a well-concerted plan. At last the defection of the fourth legion decided him, and he hastened from Rome to his province of Cisalpine Gaul, fearing lest he might fail to find support there also, if he stayed away any longer. Decimus Brutus, who was the actual governor of Cisalpine Gaul, to which he had been appointed by the Dictator, refused to give up the province to Antonius. Cæsar hated Decimus Brutus and Antonius equally, but the time was not yet come for avenging his uncle's death, and he accordingly made proposals to aid Decimus if he would keep the province against Antonius. The senate passed a vote of thanks to Decimus Brutus and to Cæsar, and the soldiers who had deserted Antonius. Cicero, who had been wavering, now came forward as the supporter of the "boy Octavian," and spoke strongly in his favour before the senate. On the 2nd of January, B.C. 43, Cæsar was invested with the rank of Proprætor, and commissioned to command the troops which he had raised: he received the rank of Prætor, and with it the privilege of voting in the senate; the law also which limited the age for attaining the consulship was so far repealed as to allow him to enjoy the office ten years before the legal age. Before the close of the year B.C. 44, Antonius was besieging Decimus Brutus in Mutina. The senate, on the 5th of January, B.C. 43, sent proposals of peace to Antonius, which were supported by the advance of the consul Hirtius and his legions. Cæsar with his troops joined Hirtius; the other consul, Pansa, arrived afterwards with his troops. In the conflicts that ensued about Mutina, Antonius was finally defeated, but both the consuls lost their lives. Mutina being relieved, and Antonius driven across the Alps, the senate now changed their tone towards Cæsar. Decimus Brutus, who had done nothing, received public thanks, and the commission to follow

up the war against Antonius at the head of the consular army. The name of Cæsar was not mentioned. Cæsar dissembled his vexation at D. Brutus being appointed to the command; he asked for a triumph, and the senate refused it. Cæsar now made overtures to Antonius; but he also aspired to the consulship, and he wrote to Cicero, urging him to be his colleague. Cicero was pleased with the proposal, and he laid it before the senate; but the senate would not listen to it. Antonius and Lepidus, after a short negotiation, had become reconciled, and they united their forces, on the 28th of May, B.C. 43, and crossed the Alps into Cisalpine Gaul. The alarm of the senate on receiving this intelligence was great; they made preparations to oppose Antonius, and in order to pacify Cæsar they named him to the joint command with D. Brutus, simply for fear that he might join Antonius. But Cæsar was not to be pacified: he induced his soldiers to ask the consulship for him, which the senate refused on the ground of his youth. The army of Cæsar was in a state of frenzy, and called upon him to lead them to Rome. With his forces he crossed the Rubicon, the little stream which then separated the province of Cisalpine Gaul from Italy, and dividing his troops into two parts, left one part to follow him, while with the other he marched rapidly upon Rome. Thus, six years after Cæsar crossed the Rubicon to enforce his claims against the senate and his rival Pompeius, his adopted son, who bore the same name, crossed the same sacred boundary of the province to maintain a similar claim against the senate. The coincidence is striking, and it is not passed unnoticed by Appian. Rome was all in alarm: the senate, as when the first Cæsar crossed the Rubicon, were unprepared; M. Brutus and Cassius, the great support of their party, were now in the East; and Cicero, who had been loud and active, disappeared, as he did when the first Cæsar was advancing on the city. The senate now yielded all that had been asked; but the sudden arrival of two legions, which they had sent for from Africa, again roused their drooping courage; Cicero again showed himself, and it was resolved to oppose Cæsar by force, and to seize his mother and sister as hostages, but they contrived to conceal themselves. The treachery of the senate only irritated the army of Cæsar, who in a short time occupied, without any resistance, a position in front of the city, in the neighbourhood of the Quirinal Hill; on the next day he entered Rome with a small guard, and was greeted by his mother and sister with the Vestal virgins in the temple of Vesta. There was no further attempt at opposition.

Cæsar knew his power, and he only laughed at his enemies. He brought his forces into the Campus Martius, and he showed all through these trying circumstances the most perfect self-possession and prudence. Those who had taken the most active part against him were allowed to be unmolested: they were spared for the present. He distributed a large sum of money among his soldiers, and he soon paid the legacies which the dictator had left to the people. Cæsar and Quintus Pedius, his kinsman, were appointed consuls for the rest of the year. The election took place in the month of August, B.C. 43, when Cæsar was in his twentieth year. Being now invested with constitutional authority, he caused his adoption to be regularly confirmed by a Lex Curiata. He also caused a measure to be passed for the relief of Dolabella, who had been declared an enemy; and in pursuance of a Lex which was proposed by his colleague Pedius, a regular prosecution was instituted against the assassins of Cæsar and their accomplices. The prosecution was conducted in due legal form, and as none of the accused appeared, they were convicted pursuant to law. Thus the conspirators were in effect declared enemies of the Roman state, and there remained nothing but to enforce the sentence by arms. But to accomplish this, Cæsar wanted the aid of Antonius. Accordingly he left the city and advanced towards Cisalpine Gaul, while his colleague Pedius stayed at Rome to further his views. The senate were induced by their fears to come to terms with Antonius and Lepidus; they repealed their own decrees by which Antonius and Lepidus had been declared enemies, and they sent a friendly message to Antonius and Lepidus. Cæsar also wrote to Antonius, and offered his assistance against Decimus Brutus. Antonius replied that he would deal with Brutus himself, and then would join Cæsar. The soldiers of Brutus deserted to Antonius and Cæsar; Brutus himself fell into the hands of a robber chief, who sent his head to Antonius. [BRUTUS, DECIMUS.]

Cæsar, Antonius, and Lepidus had an interview in an island on a small stream near Bononia (Bologna). They agreed that Ventidius should take the place of Cæsar as consul for the rest of the year, B.C. 43; that the three should administer the state for five years with equal powers with the consuls; and that they should name the annual magistrates for five years to come. It was also agreed to distribute the provinces among them: Antonius was to have all Gaul, except a part adjacent to the Pyrenees, which Lepidus was to have, together with Spain; Cæsar was to have Africa, Sardinia, and Sicily and the small adjacent islands. Cæsar and Antonius were to conduct the war against M. Brutus and Cassius, and Lepidus was to be consul, and conduct the administration in Rome with three of his legions. The remaining seven were to be distributed between Cæsar and Antonius, so as to make up their numbers to twenty legions each. It was further agreed to encourage their soldiers by promises of donations and of the distribution of the lands of eighteen cities in Italy, which were named. Finally, it was agreed that all their enemies at Rome should be

destroyed, that there might be no further danger from them. The terms of this agreement were read to the soldiers, who were well content; but nothing was said of the intended massacres.

In order to secure the union of the two chief leaders, the soldiers of Antonius also planned a marriage between Cæsar and Clodia, the daughter of Fulvia, the wife of Antonius, by Clodius. Cæsar was already betrothed to Servilia; but he broke off that engagement, and agreed to take Clodia for his wife. Clodia was yet very young, and Cæsar divorced her shortly after, without having consummated the marriage. The Triumviri, as the three were called, made a list of 300 senators and about 2000 equites, who were to be put to death. They then sent orders for the death of a small number of the most distinguished of their enemies before they reached Rome, and Cicero was among them. Some of them were immediately massacred, and alarm spread through the city; but Peditus, the consul, calmed the fears of the citizens by publishing the names of those who were to be proscribed, and declaring that these were to be the only sufferers. But Peditus was not in the secret of his colleagues, and he died before the Triumviri reached Rome.

The Triumviri entered Rome separately, each with his prætorian cohort and a legion: the city was filled with soldiers. A law was hurriedly passed by which Cæsar, Antonius, and Lepidus were invested with consular power for five years, for the purpose of settling affairs, and thus the Triumvirate was constituted in legal form. In the following night a list of 130 persons, who were proscribed, was set up in many parts of the city; and 150 more were soon added to the list. Notice was given that the heads should be brought to the Triumviri, and the bearer was to have a fixed reward; if a freeman, money; if a slave, his liberty and money too. Rewards were offered to those who should discover the proscribed, and the penalty for concealing them was death. Lepidus was foremost in this affair, though Cæsar and Antonius were the most unrelenting after a beginning was made. As soon as the lists were published, the gates of the city were closed, and all the outlets and places of refuge were strictly watched. And then came a scene of misery such as had not been witnessed even in the times of Marius and Sulla. Every avenue in the city and all the country round Rome was scoured by soldiers eager to earn the rich reward by carrying heads to the Triumviri. All the enemies of the Triumviri who were unfortunate enough to be found, were sacrificed to their vengeance. Many of those who escaped were drowned at sea, but some reached Sicily, where they were kindly received by Sextus Pompeius, the son of the dictator's great rival.

Sicily, which had fallen to the share of Cæsar in the distribution of the Western provinces, was held by Sextus Pompeius, who had a well-manned fleet. Cæsar sent his admiral Salvidienus Rufus against Sicily, and went to Rhegium, where he met Salvidienus. A severe battle took place in the strait, in which the loss was about equal on both sides. Giving up Sicily for the present, Cæsar sailed to Brundisium, whence he crossed over to Dyrrachium to join Antonius. M. Brutus and Cassius had now advanced from Asia as far as Philippi in Macedonia, where they heard that Antonius was approaching, and that Cæsar had fallen ill and was detained at Dyrrachium. Cæsar arrived before the battle, though he was still feeble. In the first of the two engagements at Philippi, Cassius killed himself, thinking that all was lost; and in the second Brutus was defeated, and put an end to his life. Many of their soldiers joined the armies of Cæsar and Antonius. This decisive victory, which broke the senatorial party, was mainly due to the courage and generalship of Antonius. The battle of Philippi was fought about the close of B.C. 42. A large body of the army of Brutus and Cassius capitulated to Cæsar and Antonius.

A new division of the provinces was now made. Cæsar and Antonius arranged matters their own way, and took from Lepidus what had been given to him. Antonius set out to the East to collect money; Cæsar returned to Italy to superintend the distribution of the promised lands among the soldiers.

Cæsar fell ill at Brundisium, and a report reached Rome that he was dead. Having somewhat recovered, he came to Rome, and produced letters of Antonius, pursuant to which Calenus, who held two legions in Italy for Antonius, gave them up to Cæsar, and Sextus was ordered by the friends of Antonius to give up Africa to Cæsar, which Cæsar gave to Lepidus. The soldiers who had served under Cæsar and Antonius were now impatient for their rewards, and they claimed the lands which had been specifically promised. The occupiers (possessors) urged that they ought not to be the only sufferers, and that all Italy should contribute. But the promised lands were given to the soldiers, and they were established as military colonies in due form. Thousands were driven from their homes, and many of the ejected cultivators fled to Sextus Pompeius in Sicily. Rome also was crowded with them: they came to complain of the hardships of their lot; young and old, women and their children, filled the public places and the temples with their lamentations. Cæsar could only tell them that they must submit to necessity; the soldiers must be satisfied. The sufferers were loud in their complaints against him, but he looked steadily at one object, to secure the favour of his soldiers. His prudence and firmness stopped a mutiny at Rome which threatened dangerous consequences.

In the year B.C. 41 the consuls were Publius Servilius and Lucius Antonius, one of the brothers of Marcus. But Lucius, and Fulvia, the

wife of Marcus, who was left by her husband in Italy, really directed the administration. Lucius and Fulvia were jealous of the popularity which Cæsar was gaining, and they now made an effort to destroy him. Fulvia had also hopes that a war might bring back her husband, who was enslaved by Cleopatra, the queen of Egypt. Cæsar was supported by M. Agrippa, and by Salvidienus, who advanced from Spain, and joined him with six legions. After some unsuccessful movements on the part of Lucius Antonius, he threw himself with his forces into the strong city of Perugia, which Cæsar and his generals blockaded. The place was obstinately defended, but famine at last compelled a surrender, B.C. 40. Lucius was pardoned; but three or four hundred captives, among whom were the Decuriones of Perugia, were put to death. It is told both by Suetonius and Dion Cassius that they were slaughtered like victims at an altar erected to the honour of the deified Dictator, and the day of the sacrifice was the memorable *Ides of March*.

Italy being now clear, Cæsar again thought of attacking Sextus Pompeius in Sicily, but having no ships, and learning what the force of Pompeius was, he took another course. He foresaw that there might be a contest with Antonius, and he wished to prepare the way for a reconciliation with Pompeius. Accordingly he commissioned Mæcenas to negotiate a marriage for him with Scribonia, the sister of Lucius Scribonius Libo, who was the father-in-law of Sextus Pompeius. Libo consented, and Cæsar took for wife Scribonia, a woman much older than himself, who had already had two husbands.

M. Antonius left his wife Fulvia ill at Sicyon. He had not a large army with him, but he entered the Ionian Sea with two hundred vessels, where he met with and received the submission of the fleet of Cn. Domitius Ahenobarbus, who had been an adherent of Brutus and Cassius. The combined fleet came to Brundisium, which was occupied by troops of Cæsar, and strictly blockaded it. Pompeius being requested by Antonius to join him, sent Menodorus, or Menas, with a strong force to Antonius, and also seized Sardinia, which belonged to Cæsar, and gained over two legions which were in the island. Cæsar, seeing the position of affairs, sent Agrippa into Apulia, and, following with a considerable force, he seated himself down near Brundisium. The soldiers of Cæsar wished to effect a reconciliation between him and Antonius, which was accomplished mainly through the intervention of Cocecius, a common friend, and was facilitated by the arrival of the news of Fulvia's death. It was agreed that Antonius and Cæsar should again be friends, and that the sister of Cæsar, Octavia, who had just become a widow by the death of her husband Marcellus, should marry Antonius. There were great rejoicings in both armies on this occasion. A new division of the provinces was made between Cæsar and Antonius: all to the west of Scodra, a town of Illyricum, was to be administered by Cæsar; Antonius was to have all to the east of Scodra; Lepidus was to keep Africa, which Cæsar had given him; and Cæsar was to be allowed to prosecute the war against Pompeius if he chose. Antonius and Cæsar entered Rome, and the marriage of Antonius with Octavia was celebrated.

Rome was still afflicted with famine, and the usual supplies of grain were stopped by Pompeius and his partisans, who held Sicily, Sardinia, and Corsica. The famine and the attempt to raise money by heavy taxation caused great riots in the city, and both Cæsar and Antonius were pelted with stones by the populace. The riots were only put down by force. At last, Cæsar and Antonius went to Baie to meet Sextus Pompeius. The interview between the two Triumviri and Pompeius took place at Puteoli. The first conference led to no result, but they finally agreed to peace on these terms: Pompeius was to hold Sardinia, Sicily, Corsica, and the Peloponnesus, with the same powers that Cæsar and Antonius had in their respective administrations; and the exiles were to be allowed to return, with the exception of those who had been condemned for the murder of Cæsar. It was also agreed to marry the daughter of Pompeius to Marcellus, the stepson of Marcus Antonius, and the nephew of Cæsar.

In the following year, B.C. 38, war broke out between Cæsar and Sextus Pompeius, on various grounds of dispute. The campaign was unfortunate for Cæsar, and he lost more than half of his ships. During this year he put away his wife Scribonia, who had borne him a daughter, Julia; and married Livia Drusilla, the wife of Tiberius Nero, who must have either divorced herself from her husband or have been divorced by him; for according to Roman law, a man could not marry the wife of another. Livia was then six months gone with child, with Drusus, the brother of the future emperor Tiberius. Cæsar remained attached to her as long as he lived, and she had always great influence over him. In the spring of the year B.C. 37, Antonius crossed over to Tarentum from Athens with three hundred vessels, with the intention of assisting Cæsar against Pompeius. Suspicious he was growing up between them, which were partly removed by Octavia visiting her brother. An interview followed between Antonius and Cæsar on the river Taras, which ended in a reconciliation. Antonius gave Cæsar a hundred and twenty ships, and Cæsar gave or promised Antonius 20,000 legionary soldiers from Italy. The period of the five years' triumvirate was now near expiring, and they renewed it for another five years. It was also agreed at this interview that Antyllus, the eldest son of Antonius, should marry Julia, the daughter of Cæsar.

Cæsar had been actively engaged in preparing for the war against

Pompeius. Hostilities did not commence till the month of July. The fleet of Cæsar was shattered by a storm, but Pompeius continued in his usual inactivity. Lepidus, who had been invited to aid in the war against Pompeius, had landed in Sicily before Cæsar, with part of his forces; the fleet which was bringing the rest from Africa was met at sea by Papius, one of the commanders of Pompeius, and dispersed or destroyed. Agrippa was now in the command of the fleet of Cæsar, and, under his able direction, Cæsar was finally victorious. [AGRIPPA, M. VIPSANIUS.] Pompeius fled from Sicily, and many of his soldiers deserted to Cæsar and Lepidus. The force of Lepidus now amounted to twenty-two legions, and he had a strong body of cavalry. He was thus encouraged to claim Sicily, as he had landed on the island before Cæsar, and had reduced most of the cities. Cæsar and Lepidus had an interview, from which they parted in anger and with mutual threats. A new civil war seemed to be ready to break out; but the soldiers of Lepidus knew his feeble character, and they admired the vigour which Cæsar had recently displayed. Cæsar had little difficulty in gaining them over, and Lepidus himself, on the defection of his troops, speedily submitted. Cæsar sent him to Rome stripped of his military command, but still retaining his office of Pontifex Maximus; and Lepidus was content to spend the rest of his days in inglorious quiet. Cæsar did not pursue Pompeius, who, after various intrigues against M. Antonius, was taken prisoner in Asia Minor by the generals of Antonius, and put to death (B.C. 35).

The force of Cæsar now amounted to forty-five legions, 25,000 horsemen, near 40,000 light troops, and 600 vessels. He gave his troops rewards for their late services, and he promised more; the commanders of Pompeius received a pardon. But the army was dissatisfied, especially his old soldiers, who claimed exemption from further service, and the same solid rewards which the soldiers had received who fought at Philippi. Cæsar was obliged to yield: he pacified the officers; and allowed those soldiers to retire who had served at Philippi and before Mutina, to the number of 20,000, but he sent them from Sicily immediately, that they might not corrupt the rest of the army. The soldiers who were disbanded afterwards received lands in Campania; the rest received a present of money, which was probably paid out of the heavy contribution that was levied on the conquered island.

Before the close of the year B.C. 36, Cæsar, now twenty-eight years of age, returned to Rome, where he was joyfully received by all classes. The Senate were profuse in voting him honours; but he was moderate in his wishes. He accepted a minor triumph, and a gilded statue in the forum, which represented him in the dress in which he entered the city. He also consented that there should be an annual celebration of the Sicilian victories. He now turned his attention to domestic affairs. Rome and Italy were infested with robbers and pirates; but they were put down by the vigour of Sabinus, who received a commission for that purpose. The regular magistrates now resumed many of their functions; all evidence of the late civil quarrels was burnt, and Cæsar promised to restore the old constitution when Antonius returned from his Parthian expedition.

While Antonius was occupied in the East, Cæsar invaded Illyricum (B.C. 35). He also marched against the Pannonians, whom he compelled to submit. On his return to Rome, the Senate decreed him a triumph, which he deferred for the present; but he obtained for his sister Octavia, who had been staying at Rome since Antonius left Italy, and for his wife Livia, exemption from the legal incapacities of Roman women in the management of their own affairs, and the privilege of their persons being declared inviolable, like the tribunes. They were thus placed in the same rank with the Vestal virgins. This measure, the object of which is not mentioned by the historian, was intended as a mark of honour, and probably as a means of safety in case of any reverse to Cæsar. It is said by Dion, that Cæsar meditated an invasion of Britain after the example of the Dictator; and that he had advanced as far as Gaul, when he was recalled by an outbreak of the Pannonians and Dalmatians. Agrippa first marched against the Dalmatians, and he was followed by Cæsar. The Dalmatians made a brave resistance; and Cæsar himself was wounded in this campaign.

Rome now began to reap some benefit from peace; and the public improvements of Agrippa during his edilship (B.C. 33) added both to the salubrity and the splendour of the city. [AGRIPPA, M. V.] The spoils of the Dalmatian war supplied the funds for the porch and the library, which were called Octavian, in honour of the sister of Cæsar. A learned grammarian (Suetonius, 'De Grammat.' 21) was placed at the head of the library. The year B.C. 33 was Cæsar's second consulship.

Cæsar and Antonius had long foreseen that there would be a contest between them, and the removal of Sextus Pompeius and Lepidus was a preliminary to it. Neither of them now had an enemy to contend with, for Cæsar was at peace in the West, and the Parthians were quiet. Mutual causes of complaint and recrimination were not wanting. Cæsar procured war to be declared against Cleopatra, affecting to regard Antonius as merely her slave. In the spring of B.C. 31 the fleet of Cæsar under the command of Agrippa swept the eastern part of the Adriatic, and Cæsar with his legions landed in Epirus. On the 2nd of September he gained a complete victory at Actium over Antonius and Cleopatra. A few days after the battle of Actium the land-forces

of Antonius surrendered. The conqueror used his victory with moderation, and only a few were put to death, who were his declared enemies. Mæcenas was sent to Rome to maintain quiet in Italy, and Cæsar set out for Athens, whence he passed over to Samos on his route to Egypt, whither Antonius and Cleopatra had fled; but a mutiny among the veterans who had been sent to Italy under Agrippa recalled him, and he reached Brundisium after a dangerous winter voyage. Here he was met by the senators of Rome, and matters were settled for the present by giving money to some of the soldiers and lands to others. The spoils of Egypt afterwards supplied the demands of those who consented to wait.

The year B.C. 30 was the fourth consulship of Cæsar. After staying twenty-seven days at Brundisium, he set out for Egypt by the route of Asia Minor and Syria. His movements were so rapid that Antonius and Cleopatra received at the same time the news of his return from Asia to Italy, and of his second voyage to Asia. Cæsar entered Egypt on the side of Pelusium, which he took; but it was said that the city was surrendered at the command of Cleopatra, who had some hopes of conciliating or captivating the adopted son of her former lover the Dictator. The events which followed, the death of Antonius, and that of Cleopatra, belong to other articles. [ANTONIUS, MARCUS; CLEOPATRA.] Cæsar was much disappointed in not securing Cleopatra for his triumph. She and Antonius were placed by his orders in the same tomb. Cæsar immediately put to death Antyllus, the eldest son of Antonius by Fulvia, who was betrothed to his own daughter; and Cæsarion also, the son of Cleopatra by the Dictator Cæsar, was overtaken in his flight and killed. Iulus, a younger son of Fulvia by Antonius, and his children by Cleopatra, were spared. Egypt was made a Roman province, of which Cornelius Gallus, who had assisted in its reduction, was appointed the first governor.

Before leaving Alexandria Cæsar saw the body of Alexander, which was embalmed and kept in the city which he had founded. He placed upon it a golden crown, and strewed it with flowers. He returned to Asia Minor through Syria, and entered on his fifth consulship while he was in Asia (B.C. 29). In the summer of this year he passed through Greece to Italy. His arrival in Rome was celebrated in the month of August by three triumphs on three successive days, for his Dalmatian victories, the victory at Actium, and the reduction of Egypt. The temple of Janus was closed, and Rome was at peace with herself and with the world.

Cæsar, it is said, now thought of laying aside the power which he had acquired, and he consulted his friends Mæcenas and Agrippa. Agrippa recommended him to resign his power; Mæcenas advised him to keep it, and this advice or his own judgment he followed. In this year (B.C. 29) he received the title of Imperator, not in the old sense of that term as it was understood under the republic, but as indicating a permanent and supreme power. With the aid of Agrippa, and acting as censor, though perhaps without the title, he reformed the senate. One hundred and ninety unqualified members were induced or compelled to retire. In his sixth consulship (B.C. 28) Cæsar had for his colleague Marcus Agrippa, and it was signalled by the solemn celebration of a lustrum and the taking of the census, an improved administration of the treasury, and the construction of useful buildings, among which were the temple and the library of the Palatine Apollo. But it is the seventh consulship of Cæsar (B.C. 27) which forms a memorable epoch in his life, and in the history of the empire. He proposed to the senate to restore the old republican form, which in effect was to restore to the senate the administration of the Roman state; but he was urged by them to remain at the head of affairs, and he consented to administer part of the empire, and to leave the rest to the senate. A division of the provinces was made, according to which those which were on the frontiers and most exposed were administered by Cæsar. In the west he had all the Gauls, and part of Spain with Lusitania; in the east he had Coele-Syria, Phœnicia, Cilicia, Cyprus, and Egypt. Italy was not a province; it was now all Romanised, and was the seat of empire. Cæsar would only undertake the administration of these parts of the empire for ten years; but at the end of the ten years the administration was given to him again, and this was repeated to the end of his life. This was a great change in the administration of the state, and Cæsar thus obtained a power which in extent no Roman had enjoyed before. On the 16th of January, B.C. 27, Cæsar received from the senate and the Roman people the title of Augustus, the Sacred or the Consecrated, by which name he is henceforth known on his medals, sometimes with the addition of Cæsar and sometimes without. The Augustan years were dated at Rome from this time, which is also generally considered the commencement of the empire. The title was conferred, as the historians state, by the senate and the people, which means that the senate proposed the measure and it was confirmed by a lex.

In the year B.C. 23, the eleventh consulship of Augustus, the senate conferred on him the tribunitian power for life. He was not made tribune, but he received and exercised for thirty-seven years all the authority of the office, as if he had been annually elected to it under the old constitutional forms. The ordinary tribunes still continued to be elected as before. His person was thus declared inviolable, and he could, according to the old constitutional forms, obstruct any measures in the senate or prevent any enactment of any lex or plebiscitum by the popular assemblies.

In B.C. 12, on the death of Lepidus, Augustus was made Pontifex Maximus, and probably was elected by the popular assembly, to whom the choice of the Pontifex Maximus had been restored, B.C. 63. The title of Pontifex Maximus, or the head of religion, like that of Tribunitian Power, appears from this time on the medals of Augustus, and on those of his successors. But it was not by names or titles, it was by the accumulation of powers and offices in his own person, and by his prudent management, that Augustus was in effect the administrator of the Roman state, while all the old forms were maintained. The effect of the union of so much power, military and civil, in one person, was what Tacitus has briefly characterised: he gradually assumed "the functions of the Senate, of the Magistrates, and of the Laws."

The great events of the period of Augustus can only be briefly mentioned in chronological order. They show his activity in the administration of the state, and enable us to form a better estimate of his character. In B.C. 27 he set out for Gaul, intending or pretending that he would visit Britain; but from Gaul he passed into Spain, in which he established order. Augustus spent the years B.C. 28 and B.C. 25 in Spain, where he was engaged in a war with the Astures and Cantabri, the warlike inhabitants of the Asturias and the north-west of Spain. The successful conclusion of the war was signalled by the temple of Janus being closed a second time by Augustus, and by the settlement of veterans in the colony of Emerita Augusta (Merida) on the Guadiana. The year B.C. 24 is memorable for the expedition against Arabia Felix of Ælius Gallus, who was then governor of Egypt. The next year (B.C. 23), that in which Augustus received the Tribunitian power for life, and his eleventh consulship, brought a domestic calamity, the death of young Marcellus, the son of his sister Octavia, and the husband of his daughter Julia. His peace was also disturbed by conspiracies: that in which Murena was engaged, or alleged to be engaged, belongs to the year B.C. 22. In B.C. 21 Augustus again left Rome for the purpose of settling the eastern part of the empire. He first visited Sicily, and while he was there great disturbances occurred at Rome during the election of the consuls, for the old forms of election were still maintained, as they were during the lifetime of Augustus. The disturbance required his interference, but he did not return to Rome: he appointed Agrippa to the administration of the city in his absence, and gave him his daughter Julia in marriage. [AGRIPPA, M. V.] From Sicily Augustus passed over into Greece, and thence to the island of Samos, where he spent the winter. The year B.C. 20 is memorable for the restoration by the Parthians of the standards which they had taken from Crassus and M. Antonius, and of the captive soldiers, an event which the flatterers of Augustus have often commemorated; and also for the birth of Julia's son by Agrippa, Caius Cæsar, as he was afterwards called. Augustus spent another winter at Samos, where he received ambassadors from the Scythians and the Indians. The Indians brought presents, and among them some tigers, which the Romans had never seen before. From Samos Augustus passed over to Athens, and from thence returned to Rome in the following year, B.C. 19. The Cantabri had revolted in B.C. 22, and were finally subdued in this year (B.C. 19) by Agrippa, who after sustaining several reverses nearly annihilated all the Cantabrian warriors. In the year B.C. 18 the ten years had expired for which Augustus had undertaken the administration, but the period was renewed for five years, and Agrippa was associated with Augustus in the Tribunitian power for the same period. With the aid of Agrippa, he made another revision of the senate. In this year Virgil died, on his return from Athens, where he had seen Augustus. The carrying of the Lex Julia De Maritandis Ordinibus, the object of which was to compel people to marry under penalties, belongs to the year B.C. 18. In this year Julia bore another son, Lucius, who, together with his brother Caius, was immediately adopted by Augustus, and these youths are henceforth called Caius Cæsar and Lucius Cæsar. Agrippa, with his wife Julia, set out for Syria, being intrusted with the general administration of affairs in those parts. In B.C. 16 Augustus left Rome for Gaul, his main object being to superintend warlike operations against the Germans, who had defeated Marcus Lollius. Statilius was the governor of Rome and Italy in his absence. The Rheti, an Alpine people, were subdued by Tiberius and Drusus, the stepsons of Augustus: and many colonies were established or restored in Gaul and Spain, the lands being given to satisfy the claims of the old soldiers, who were continually asking for grants. Augustus returned from Gaul in the year B.C. 13, and gave to the senate a written account of his proceedings. In this year, according to Dion, Augustus dedicated the theatre of Marcellus, and games were celebrated, in which 600 wild beasts from Africa were slaughtered. The year B.C. 12 is that in which Lepidus died, and Augustus succeeded him as Pontifex Maximus: Agrippa also died in this year, and in the following year his widow Julia was married to Tiberius, the stepson of Augustus. The new bridegroom was sent off to fight against the Pannonians, whom he defeated, and the marriage was solemnised on his return.

In B.C. 10 Augustus was again in Gaul with his stepson and son-in-law Tiberius. Drusus also prosecuted the war against the Germans in this and the following year. He advanced as far as the Elbe, but his career was cut short by a fall from his horse, which occasioned his death. His body was carried to Rome, and Augustus pronounced his funeral oration in the Circus Flaminius: he also wrote an epitaph

for his tomb and composed a memoir of his life. In the year B.C. 8 Augustus, with a show of unwillingness, accepted the administration again for a period of ten years; and this year is recorded as that in which the month Sextilis received the name of Augustus, which it retains. In this year also a census was taken. Tiberius now conducted the military operations on the Rhine. Two more of the friends of Augustus died this year, Mæcenas and the poet Horace. Mæcenas had for many years been his faithful friend and adviser, and had been intrusted with the important office of Præfectus Urbi. It was believed in Rome that Augustus, among his other amours, had an adulterous commerce with Terentia, the wife of Mæcenas, which caused her husband some vexation, but it never made him break with Augustus, and he left him the bulk of his immense fortune. Tiberius received the title of Imperator for his German victories, and in the year 6 he received the Tribunitian power for five years; but instead of staying at Rome, he retired to Rhodes, where he resided for seven years.

In the year commonly reckoned B.C. 4, or, according to perhaps the best authorities, in the year B.C. 3, Jesus Christ was born at Bethlehem in Judæa. Some chronologists place this event in the year B.C. 2.

The year B.C. 2 was the thirteenth consulship of Augustus, and in this year L. Cæsar received the toga virilis: Caius, the elder, had taken it in B.C. 5. Thus Augustus had two grandsons, his sons by adoption, who had attained the age of puberty, and he had a prospect of securing in his family the succession to a greater power than any man had ever yet acquired. But his happiness was marred by the conduct of his daughter Julia, the mother of his adopted sons. In the lifetime of Agrippa she had perhaps not been a faithful wife, but now in the thirty-eighth year of her age she had broken through all the bounds of decency and prudence. Her indignant father could hardly restrain himself when he ascertained the extent of her degradation. Many of her lovers were put to death, and among them Antonius Iulus, a son of M. Antonius by Fulvia. Julia was, under the Lex Julia, banished to the small island of Pandataria, on the coast of Campania, and afterwards to Rhegium, where she lived a life of misery, and yet survived her father. Her mother Scribonia, the long-divorced wife of Augustus, voluntarily accompanied Julia in her exile. Julia, the grand-daughter of Augustus, his daughter's daughter, who was married to L. Æmilius Paulinus, followed her mother's example, and suffered a similar punishment (A.D. 8).

In A.D. 1 Caius Cæsar was sent to conduct the war in Armenia, and Tiberius came from his retirement as far as Chios to pay his respects to the adopted son of Augustus. But the time was near when the son of Livia was to become the representative of the Cæsars. Lucius Cæsar died at Massilia, in A.D. 2, shortly after Tiberius had returned to Rome. Caius died in Lycia, on his return from Armenia, in A.D. 4; and Augustus, who in the year preceding had accepted the administration for another decennial period, now adopted Tiberius as his son, and associated him in the Tribunitian power for ten years. At the same time he compelled Tiberius to adopt Germanicus, the son of his brother Drusus, though Tiberius had a son of his own. Tiberius was sent to conduct the military operations on the German frontier: the details of these events belong to his life. After a successful campaign Tiberius returned to Rome, in A.D. 9, the same year in which Ovid was banished from Rome. The success of Tiberius and the laurels won by his adopted son Germanicus in this year and the preceding, were overcast by the news of the defeat of Quintilius Varus and the destruction of his army. [HERMANN.] This was the greatest reverse which Augustus sustained in the long course of his administration. The war on the German frontier continued, and in A.D. 12 Tiberius enjoyed a triumph for his victories. In A.D. 13 Augustus for the fifth time accepted the administration of the empire for ten years. He had now lived long enough to see all his direct male descendants die, except one grandson, Agrippa Postumus, a youth of unpromising disposition, who was sent into banishment. But Claudius, the son, and Caligula, the grandson of his stepson Drusus, were already born, and both of them became in time his unworthy successors. Even Vespasian, the eighth in the series of the Roman Cæsars, was born in the lifetime of Augustus.

In A.D. 14 Augustus held the third census, with the assistance of Tiberius. He had for some time been in feeble health. In the summer of this year, after superintending the celebration of some games at Naples, he retired to Nola, where he died on the 19th of August, in the seventy-sixth year of his age, and in the same room in which his father had died. Feeling his end near, he called his friends together, and asked them if they thought he had played his part well in life; and if they did, he added, give me then your applause. He died while he was kissing Livia, and telling her to remember their union. An accomplished actor undoubtedly he was, and he played a great part. A rumour that he was poisoned by his wife has been preserved by the historians, but not the slightest evidence is alleged in confirmation of it. By his will he left Livia and Tiberius his heirs.

In this imperfect sketch some facts have been stated without any limitations, which in a history would require a careful examination. Of all periods this is one of the most eventful, and of all perhaps the most fruitful in consequences, for it is the period in which was consolidated that system of government and administration which has determined the character of European civilisation. It is remarkable also for the personal history of the man, which, from the battle of

Actium, comprized a period of near forty-four years, and from the time of his landing at Brundisium in B.C. 44, a period of fifty-seven years. Augustus was of middle stature, or rather below it, but well made. The expression of his handsome face was that of unvarying tranquillity; his eyes were large, bright, and piercing; his hair a lightish yellow; and his nose somewhat aquiline. The profound serenity of his expression and the noble character of his features are shown by his gems and medals. He was temperate even to abstinence in eating and drinking, and he thus attained a great age, though he was of a feeble constitution; but though a rigid father, and a strict guardian of public morals, he is accused of incontinence. He was fond of simple amusements, and of children's company. In all his habits he was methodical, an economiser of time, and averse to pomp and personal display. He generally left the city and entered it by night, to avoid being seen. The master of so many legions—he who directed the administration of an empire which extended from the Euphrates to the Pillars of Hercules, and from the Libyan Desert to the German Ocean—lived in a house of moderate size, without splendour or external show. From his youth he had practised oratory, and was well acquainted with the learning of his day. Though a ready speaker, he never addressed the senate, the popular assemblies, or the soldiers without preparation, and it was his general practice to read his speeches. He was a man of unwearied industry, a great reader, and a diligent writer. His successful encouragement of literature, especially in the persons of Virgil and Horace, has procured the name of the Augustan age for the brilliant period in which he lived. He was also himself an author. Plutarch ('Anton.' 22) and Appian ('Bell. Civ.' iv. 110) availed themselves of commentaries written by the emperor; and Suetonius (85), most probably alluding to the same work, mentions an autobiography in thirteen books extending down to the Cantabrian war. He wrote also a poem in verse called 'Sicilia,' some epigrams, and a tragedy called 'Ajax;' the last did not satisfy him, and was never published. The fragments of the emperor's works were collected by J. Rutgers, and published by J. A. Fabricius, 1724, 4to.

(Cicero, *Letters*; Horace; Virgil; Ovid; the *Monumentum Ancyranum*; Velleius; Tacitus; Plutarch, *Life of Antony*, &c.; Appian, *Civil Wars*, books ii. iii. iv. v.; Suetonius, *Life of Octavius*; Dion Cassius; Clinton, *Fasts*; *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge*.)

As the relations of the members of the Augustan family are exceedingly intricate, and yet a knowledge of them is essential to a full understanding of the history of the Roman empire, we subjoin a stemma of the family drawn up by Lipsius. (See Oberlin's 'Tacitus,' vol. ii. p. 581.) There are some difficulties about a few names, but they are of no importance.

C. Octavius by Ancharia has Octavia the Elder; by Atia, daughter of Balbus, he has Octavia the Younger, and C. Octavius, afterwards AUGUSTUS. From which of the daughters the following progeny springs is uncertain.

- I. Octavia
- 1. M. Marcellus, married (1) Pompeia, daughter of Sextus Pompeius, and (2) Julia, daughter of Augustus—has no progeny.
 - 2. Marcella the Elder.
 - a. By M. Vipsanius Agrippa } Children of names unknown.
 - b. By Julius Antonius Africanus, son of the Triumvir } L. Antonius Africanus, father or uncle of . . . } S. Antonius Africanus?
 - 3. Marcella the Younger.
 - 1. Domitia, married Crispus Passienus?
 - 2. Domitia Lepida.
 - a. By M. Valerius Barbatulus Messalla . . . } Valeria Messallina, m. Claudius, the emperor.
 - b. By Ap. Junius Silanus? . . . } None!
 - 3. On. Domitius, by Agrippina . . . } NERO.
- a. By C. Marcellus
- 1. Antonia the Elder, By L. Domitius Aenobarbus . . .
 - 1. Germanicus, adopted by Tiberius. By Agrippina, dr. of Julia . . . } See below.
 - 2. Livia or Livilla, m. C. Caesar, and afterwards Drusus, son of Tiberius, is betrothed to Sejanus.
 - 3. CLAUDIUS.
 - a. By Plautia Urgulanilla . . . } 1. Drusus, Betrothed to dr. of Sejanus.
 - 2. Claudia, Antonia, m. Pompeius M. and Faustus Sulla.
 - b. By Elia Petilliana . . . } 1. Octavia, Betrothed to L. Silanus, m. Nero.
 - 2. Claudius Britannicus.
- b. By M. Antonius the Triumvir.
- 3. Antonia the Younger, By Drusus, brother of Tiberius
 - 1. Druusus, married Julia, daughter of Drusus, son of Tiberius.
 - 2. Drusus, married Emilia Lepida.
 - 3. CAIUS CALIGULA.
 - 4. Agrippina, By On. Domitius } NERO.
 - 5. Drusilla, married L. Cassius and M. Emilius Lepidus.
 - 6. Livia or Livilla, married M. Vicius and Quinctilius Varus?

II. C. Octavius, afterwards C. Julius Caesar Octavianus AUGUSTUS, has no children by his other wives; by Scribonia, daughter of L. Scribonius Libo, he has one daughter, Julia, Julia

- a. By M. Marcellus, son of C. Marcellus and Octavia, has no progeny.
- 1. Caius Caesar, adopted by Augustus, married Livia, sister of Germanicus.
 - 2. Lucius Caesar, adopted by Augustus, betrothed to Emilia Lepida.
 - 1. M. Emilius Lepidus, m. Drusilla, dr. of Germanica.
 - 2. Emilia Lepida, a. Betrothed to Claudius.
 - 3. Julia, By L. Emilius Paulus, son of the Censor
 - b. By Ap. Junius Silanus? . . .
 - 1. L. Silanus, Betrothed to Octavia, daughter of Claudius . . .
 - 2. M. Silanus, Proconsul of Asia.
 - 3. Junia Calpurnia, married son of Vitellius.
- b. By M. Vipsanius Agrippa
- 4. Agrippina, By Germanicus
 - 5. Agrippa Postumus, adopted by Augustus.
- c. By Tiberius, has none.
- 1. Tiberius Nero, adopted by Augustus.
 - a. By Vipsania Agrippina, gr. dr. of Atticus.
 - Drusus, By Livia, sister of Germanicus
 - 1. Ti. Gemellus.
 - 2. — Gemellus.
 - 3. Julia.
 - a. By Nero, son of Germanicus } None.
 - b. By Rubellius Plautus, m. Livia Blandula } Rubellius Plautus.
 - b. By Julia . . . } None.
- III. Tiberius Claudius Nero, By Livia Drusilla
- Drusus, By Antonia the Younger . . . } See above.

In the person of the emperor Nero the Julian family became extinct. As far as we have traced it here, the Julian blood descended from a single female, the sister of the dictator Caesar. The dictator had only a daughter Julia, who left no descendants.

AUGUSTUS I of Saxony was the second son of Henri, the pious duke of Saxony, of the junior branch of Attenburg, and was born July 31, 1526. In 1544 he became administrator of the bishopric of Meesseburg; and in 1553 he succeeded to the electorate on the death of his elder brother Maurice, who had been made elector through the influence of Charles V., in place of his cousin John Frederick, who had fought against the emperor in the wars occasioned by the Reformation, and was therefore deposed by the diet. [MAURICE.] John Frederick, son of the deposed elector, aspired to the succession, but was obliged to satisfy himself with the duchy of Gotha and other districts. Hence arose the division between the electoral, now royal, house of Saxony, which continues in the successors of Augustus, and the ducal houses of Saxe Gotha and Saxe Weimar, which are the descendants of John Frederick. Augustus was vindictive, intolerant, and selfish; but his reign was peaceful and prosperous. Once only was he obliged to take the field against his relative John Frederick, who was induced, by the suggestion of a Franconian adventurer named Grumbach, who had been outlawed for the murder of the Archbishop of Würzburg and the plunder of that town, to revolt against the emperor Maximilian II. The emperor demanded of the duke the outlaw Grumbach, and on the refusal of John Frederick to give him up, he was put under the ban of the empire, and the elector Augustus was charged with his punishment. He besieged Gotha, took it, and made the duke prisoner. Grumbach and others were put to death; John Frederick was shut up in a prison for life, and his territories were divided between his two sons.

Towards the Calvinists, or Philippists, as they were called, from Philip Melancthon, whose views they professed to follow, who had spread into Saxony and other parts of Germany, Augustus was an uncompromising persecutor. Some of the leaders he imprisoned, one or two were tortured, and the rest of the sect he banished from his dominions. He then caused a creed of Lutheran orthodoxy to be drawn up, which was styled 'Formula Concordia,' to which he compelled all the clergy and schoolmasters of ducal Saxony to swear or resign their functions. In other respects the sway of Augustus was directed to the improvement of the condition of the people. He respected the constitutions of his country, and consulted the assembly

of the states on all important occasions, especially in the raising of subsidies. His laws and ordinances were also held in high estimation, and he was styled by some the Justinian of Saxony. He embellished Dresden, and built the fine palace of Augustenburg, and yet left the coffers of the state well filled at his death in 1586. He was succeeded by his son Christian I.

AUGUSTUS II. This is the title by which the monarch is generally known who united the crown of Poland with the electorate of Saxony in 1697, although in Saxon histories he is more generally styled Frederic Augustus I. He was the second son of John George III., elector of Saxony, and was born at Dresden in 1670. Distinguished in his youth by great personal advantages, Augustus improved these by military campaigns, by travels through Europe, and by a prolonged residence in its various courts. While at Vienna he formed a friendship with the future emperor, Joseph I. His father was somewhat mistrustful of the partiality shown by his son for courtiers and personages hostile to the Protestant interest. For similar reasons a jealousy existed between Augustus and his elder brother, who succeeded to the electorate as John George IV. in 1691. This prince dying in 1694, made way for Augustus, who showed himself severe towards his brother's mistress and favourites. His first step was an alliance with Austria, in whose behalf he raised troops against France; but as he refused to serve under Prince Louis of Baden, who commanded as imperial general upon the Rhine, the court of Vienna intrusted him with an expedition against the Turks in Hungary. Here he showed valour and obstinacy, but very little skill, and obtained little success. His personal bravery however produced a marked impression on the Turks, who gave him the name of the Iron-handed.

The death of the heroic Sobieski in 1696 left the throne of Poland open to the ambition of candidates. His son, James Sobieski, was thwarted in his hopes of succeeding to the royal heritage by the avarice and enmity of his mother. The elector of Bavaria, and the prince of Conti, both aspired to the throne. Augustus was induced to become their competitor by Count Przebedowski, one of the chief dignitaries of the kingdom, who promised that money would insure success; and he was supported by all the influence of the court of Vienna. Augustus, through his able envoy, Count Flemming, lavished considerable sums at Warsaw: he thus obtained the advantage over his rival, who could but promise ten millions of florins, while Augustus paid them: the Protestant faith of the elector of Saxony was still a serious obstacle; but Augustus removed it by a public recantation at Baden, near Vienna, on Whit-Sunday, 1697. In addition to the ten millions of florins, Augustus promised to support an army of 6000 men at the cost of Saxony, and to recover Kaminietz, Wallachia, Moldavia, and the Ukraine.

Notwithstanding these promises, the great majority of electors, in a diet held the 27th of June, 1697, gave their voices to the prince of Conti. The minority however proceeded to proclaim Augustus, who entered Poland at the head of 8000 Saxons; while the prince of Conti, sailing unattended to Danzig, arrived in time to hear 'Te Deum' chanted in honour of his rival's accession. Augustus was crowned king on September 15, 1697, and made his entry into Cracow in a dress valued at a million of florins.

The first aim of the new monarch was to keep his promise of recovering for Poland its lost possessions of Podolia, the Ukraine, and Kaminietz. War, conquest, the foundation of a great empire, and his own magnificence, were the favourite dreams of Augustus. He commenced by forming an alliance with Denmark, a measure which provoked the hostility of Sweden, and then marched with an army of Saxons and Poles to drive the Turks from Kaminietz. While proceeding on this expedition, the Polish monarch met at Rava the Czar Peter returning from his travels with all the plans and projects that were to procure him the title of 'the Great.' The bold, frank, ambitious, yet uncrafty Augustus was the ally most suitable to Peter's views: a close alliance was concluded between them, and a scheme of conquest, at the expense of Sweden, was projected. The alliance with Russia enabled Augustus to conclude the treaty of Carlowitz, by which most of the territories which he sought to recover were ceded to Poland. The allied monarchs next proceeded to the completion of their projects against Sweden. This kingdom, under the rule of an infant prince, seemed likely to offer no formidable resistance; and to detach Livonia from it seemed to Augustus to be an easy task, more especially as Patkul, a refugee Livonian, promised to rally his countrymen in support of the Saxon cause. Augustus accordingly invaded Livonia, and laid siege to Riga. The provocation had one of those electric effects on human character that change the face of history: it roused young Charles XII. of Sweden from the insignificance of youth, and excited at once the prince and his people to a pitch of heroism, that rivalled, or even surpassed, for a time the glories of the great Gustavus. Charles defeated the Russians at Narva, and forced Augustus to raise the siege of Riga; in the meantime he reoccupied Livonia, and in July 1701 defeated the Saxon army on the Duna, compelling it to abandon fortresses and artillery. The Saxons were throughout made the sacrifice and the sufferers for others: for Augustus, failing to attach to himself any of the great parties of Poland or Lithuania, could depend in his distresses upon the affection of his native kingdom alone. Lost in self-admiration, no one would have perhaps been

more worshipped than Augustus, had he been fortunate or great; in adversity, none were more despised or forsaken. His last resource was to send to Charles the Countess of Koenigsmark, his mistress, in the hope that the persuasions of beauty might soften the resolutions of the Swedish king. Charles however refused to see the fair envoy: he persisted in regarding Augustus as a usurper, and would grant no peace to the Poles, except on the condition of their electing another king. But Augustus resolved not to yield without another effort: he flew to his native Saxony, drained it of fresh funds and soldiers, and marched by the way of Cracow to the deliverance of Warsaw. The armies met between Clissow and Binczow, on the 19th July, the very day which, in the previous year, had been marked by the fatal battle on the Duna. The result was now similar. The Poles, composing the right wing of the Saxon army, fled, and the brunt of the battle falling upon the Saxons, they suffered another disastrous defeat. A party was then formed in Poland, antagonistic to the claims of Augustus. Charles allied himself with this party, and promoted the election of its leader, Stanislaus Leczinski, to the throne of Poland. Stanislaus was accordingly elected on July 12th, 1704.

The new monarch participated of course in his patron's hostility towards Saxony and Russia, and both accordingly prepared to invade the electorate, and by the conquest of Dresden itself force Augustus to abandon all claim to the Polish crown. The elector of Saxony however had not yet lost all hope: Russia was his ally, Austria his friend, and the pope obstinately refused to recognise the right of his competitor. A new army of Saxons, commanded by Schulenburg, had been raised to defend the electorate, and the czar had promised to second its operations. But the defeat of Schulenburg at Fraustadt left Saxony completely exposed to the conqueror. After this disaster Augustus began to consider submission as inevitable: he accordingly sent agents to treat with Charles, secretly however, since he himself was yet within the camp and the power of Russia. But before Augustus could escape, the czar forced him to a measure calculated to interrupt, or prevent altogether, a reconciliation with Charles XII. By the advance into Saxony, the Swedish force in Poland had been much reduced; its commander had moreover relaxed his vigilance, relying upon the negotiations which he was aware were carrying on. The czar forced Augustus, however reluctant, to take advantage of the moment and to attack the Swedes. He did so with success, and even entered Warsaw in momentary triumph. But Augustus saw that an advantage so gained was little likely to conduce to a permanent superiority. Instead therefore of making use of it to raise his tone, or diminish his concessions to Sweden, he on the contrary offered to make amends for the aggression; and at the same time accepted without hesitation the conditions that Charles had already imposed. Abandoning Russia, he hastened in person to meet the Swedish monarch at Altranstadt, and to conclude peace upon terms sufficiently humiliating. Augustus abdicated the crown of Poland in favour of Stanislaus, promised to send this prince the crown jewels, and to congratulate him by letter. He abandoned his allies and his fortresses, and was obliged to give up the unfortunate Patkul to the vengeance of Charles. Charles also, in imitation of his great predecessor Gustavus Adolphus, made himself the Defender of the Protestant Faith; and stipulated that Augustus should respect the creed and privileges of his Protestant subjects of Saxony. This peace was concluded on September 24th, 1705.

Augustus now saw himself confined to his native dominions, and condemned to political insignificance. He endeavoured to drown disappointment in luxury and expense; and by way of finding occupation for himself and his soldiers, in 1708 he placed a Saxon army of 9000 men at the emperor's disposal in the Netherlands. Schulenburg commanded them; but Augustus himself served in their ranks as a volunteer, and as such took part in the siege of Lille. His natural son, Maurice of Saxony, made his first campaign on this occasion. The battle of Pultowa, and the overthrow of the power of Sweden in 1709, recalled Augustus to the throne of Poland. The pope released him from his oath of abdication. Russia, Prussia, and Denmark supported his pretensions; and Stanislaus, instead of offering resistance, fled into Turkey to join Charles. The first efforts of Augustus on his restoration were to drive the Swedes altogether from Germany. In conjunction with Denmark, he marched into Pomerania; but here he was repulsed by Steinbock, the Swedish general.

Charles XII. himself soon after re-appeared upon the scene; but all his heroism was less dangerous to the allies than the intrigues of his minister, the Count de Goertz, who almost succeeded in subverting the existing alliances between the European states. He had nearly dissolved the bond between Augustus and Russia, when the death of Charles XII. occurred, and at once brought to a conclusion the struggles of war and of political intrigue. The restoration of Augustus to the throne of Poland aggravated the ills of that unhappy country. If Stanislaus had been raised to the throne by the dictation of a foreign power, Augustus was still more a foreigner, who relied upon Russian support, and who first placed the country at the mercy of surrounding states. Unable to rely on the Poles, Augustus endeavoured to defend his authority by Saxon soldiers. Insurrection and civil war followed; and then the country being evacuated by the Saxon soldiers, and the national army of Poland, under the crafty counsel of Russia, reduced from near 100,000 to the insignificant force of about

20,000 men, the country was left in peace, but it was the peace of inaction and death.

The interval between 1718, the year of Charles XIIth's death, and that of Augustus, which took place in 1733, passed away without being marked by any remarkable incidents. The unsuccessful effort of Augustus to secure the duchy of Courland for his son Maurice, was almost the only attempt at active policy. A marriage between the king's eldest son and an archduchess of Austria was an opportunity for Augustus to display all his magnificence. The procession was such as no court in Europe could rival; diamonds and embroidery had never been seen in greater profusion. But the people of Dresden could only look with discontented eyes on a scene of magnificence, cruelly contrasted with their own recent and present misery. In addition to this, the recantation of the young prince, and the favour shown by the king to the Jesuits and high Catholic party in Poland, filled the Lutheran population of Saxony with anxious fears for their religious liberties.

Augustus was not beloved by his subjects in either of his kingdoms; each complained that they were sacrificed to the other, while, in reality, both were sacrificed to the vain-glory, luxury, licentiousness, and prodigious extravagance of the prince. In Saxony his prodigality was favourable to the arts; the fine buildings of Dresden were mostly erected by him; and the porcelain manufacture of Saxony (the rage with the princes of that day) may be said to have been founded in his reign. Poland had not even this trifling recompense: to that unfortunate country his election was an unalleviated misfortune.

AUGUSTUS FREDERIC III., son of Augustus II., elector of Saxony and king of Poland, was born at Dresden, October 7, 1696. His father, wishing to give him the same accomplishments that had distinguished himself, sent him in 1711 to visit the different courts of Europe; but the young prince gained from his travels only the love of idleness and pleasure. The death of his father in 1733 made Augustus elector of Saxony, and left him at the same time the strongest pretensions to the throne of Poland. His indolent nature shrunk, it is said, from struggling to attain this uneasy eminence; but his wife, a daughter of Austria, urged Augustus to become a candidate. He was supported by the courts of Vienna and St. Petersburg, both anxious that Poland should have for a monarch a prince of easy disposition, possessed of foreign and distant dominions. France however favoured his father's old competitor Stanislaus, whose daughter had become the wife of Louis XV., and the Polish nation eagerly embraced the occasion to elect a native prince. But a Russian army advanced to enforce the pretensions of Augustus III.; the Poles disputed gallantly but unsuccessfully the passage of the Vistula; and under Russian auspices a few of the Saxon partisans in Poland, meeting in the village of Kamien, proceeded to the counter-election of Augustus. His competitor Stanislaus was obliged to take refuge in Danzig, which he was compelled eventually to abandon, along with his pretensions to the throne of Poland. Augustus did not become undisputed monarch of Poland till after the Diet of Pacification, held at Warsaw in 1736. Though oppressed by foreign troops, the Poles showed themselves jealous of their independence. They stipulated for the dismissal of foreigners, and for the maintenance of only 1200 Saxon guards within the kingdom.

The favourite adviser of Augustus had up to this time been the old companion of his travels, Sulkowski; but he was now superseded by Count Bruhl, who henceforth monopolised all authority in Saxony and Poland. In view of a probable dispute as to the succession to the throne of Austria on the death of Charles VI., it was Sulkowski's project to conquer Bohemia for Saxony. Bruhl at first abandoned this scheme, and leagued with Austria to support the succession of Maria Theresa. In a little time however he was tempted to throw Saxony into the opposite party, and to resume the scheme of appropriating Bohemia, while Frederic was to have Silesia. Augustus acquiesced. The Saxon and Prussian troops fought in alliance, but had not been long in the field when Augustus learned to his astonishment that his minister had again deserted Frederic. Soon after, in 1743, an alliance was concluded at Warsaw between England, Saxony, and Austria, for the defence of the house of Hapsburg. The king of Prussia instantly marched 100,000 men into Saxony, routed all that opposed him, and made himself master of Dresden, December 1745; whilst Augustus, with his minister, took refuge in Poland. The truce of 1746 however restored to him the electorate; and at the same period took place the marriage of Augustus's daughter, Maria Josepha, with the dauphin of France—a marriage from which sprung Louis XVI., Louis XVIII., and Charles X.

In consequence of a fresh plot in conjunction with Russia against Prussia, Frederic invaded Saxony in 1756, and succeeded in taking captive the entire Saxon army in its entrenched camp at Pirna. Augustus again fled to Poland. His reign in this latter country was as pernicious as in Saxony. If Saxony was humbled in its pride, stripped of its resources, and ravaged by invading armies, Poland suffered equal injury, though less violence. It was allowed to sink into what Rulhières calls 'a tranquil anarchy.' Its diets, which were seldom held, were never allowed to come to a resolution or pass a law. It had no court or king; Augustus, who was passionately fond of the chase, preferred the well-stocked forests of Saxony to the plains of Poland.

Saxony itself having fallen into insignificance, its monarchs sunk into a state of dependence upon Russia, and St. Petersburg became the capital to which the Poles resorted, rather than to Dresden. Thus the supremacy of Russia was allowed silently to establish itself in Poland under the empty government of Augustus. Pictures, porcelain, fêtes, and music, were the only cares of this weak and foolish prince, who was to his father what Louis XV. was to Louis XIV., except that Augustus III., though prodigal and luxurious, was no sensualist. Rulhières even reproaches him for his stupid constancy to his queen—a singular specimen of the French historian's own ideas of morality. Augustus III. expired at Dresden in October 1763.

AUGUSTUS FREDERICK, Prince of Great Britain and Ireland and Duke of Sussex, the sixth son and ninth child of George III., was born at Buckingham Palace on the 27th of January 1773. After having made some progress in his studies under private tuition, he went to the University of Göttingen, and subsequently travelled in Italy. During this tour, and while still under age, he contracted at Rome a marriage with Lady Augusta Murray, second daughter of the Earl of Dunmore in Scotland. The marriage ceremony was performed at Rome by a clergyman of the English Church, in April 1793, and in consequence of doubts having arisen whether a marriage performed by a Protestant clergyman in Rome, where there is no British representative, could be valid, the ceremony was repeated at St. George's, Hanover-square, London, on the 5th of December 1793. At the instance of the crown, this marriage was, in 1794, declared in the Prerogative Court of Canterbury to be null and void, by the terms of the act 12 George III., cap. 111, called the Royal Marriage Act. It is the opinion of eminent lawyers that several important points in the question involved were left untouched by the decision in this case. But the decision was in effect affirmed, by the rejection of the House of Lords of the claim of Sir Augustus D'Este to take his seat as a peer of the realm. The duke was for some years separated from Lady Augusta, who died on the 5th of March 1834, and the fruit of the union was a son, Colonel Sir Augustus Frederick D'Este, born 13th of January 1794, and a daughter, Ellen Augusta D'Este, born 11th of August 1801, who both survived their parents. Prince Augustus was raised to the peerage on the 27th of November 1801, when he received patents as Baron Arklow, Earl of Inverness, and Duke of Sussex. Parliament voted him an income of 12,000*l.* a year, which was afterwards increased to 18,000*l.* The Duke of Sussex early adopted, and was to the last days of his life a steady and persevering advocate of the liberal side in politics. In his votes and speeches, at various times, he supported the abolition of the slave-trade and of slavery, and the removal of the Roman Catholic and Jewish disabilities. He was a friend to religious toleration in its widest sense. He took a warm and active interest in the progress of the Reform Bill, and gave his support to the principles of free trade. He was also connected with many public and benevolent institutions. On his eldest brother becoming Prince Regent in 1810, the Duke of Sussex became Grand Master of the United Order of Free Masons of England and Wales. In 1816 he became President of the Society of Arts. On the 30th of November 1830 he became President of the Royal Society, which office he relinquished in 1839. Some years before his death he contracted a second marriage, without acceding to the terms of the Royal Marriage Act, with the Lady Cecilia Letitia Buggin (widow of Sir George Buggin), who, on the 30th of March 1840 was raised to the dignity of Duchess of Inverness. His Royal Highness died at Kensington Palace on the 21st of April 1843. The events of his life portray his character. He was a man of most kindly disposition, and singularly free from ostentation. He was bountiful to many institutions for purposes of charity and social improvement; and, notwithstanding this drain on his comparatively limited means, he left behind him one of the most magnificent private libraries in Britain, consisting of upwards of 50,000 volumes, 12,000 of which were theological. An elaborate catalogue of a portion of it, entitled 'Bibliotheca Sussexiana,' was prepared by Dr. Pettigrew. The first volume, relating to theological and biblical manuscripts, appeared in 1827; the second volume, relating solely to the unrivalled collection of printed bibles and portions of bibles, was printed in 1839. (Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge.*)

AUMAË, CHARLES DE LORRAINE, DUC D', sprung from a branch of the ducal house of Lorraine, which had settled in France about the beginning of the 16th century, when it was possessed of the fief of Aumale. His father, Claude d'Aumale, was governor of Burgundy, and uncle to Henry, duke of Guise, the head of the League. [GUISE, DUKES OR.] Charles d'Aumale entered into the party of the League, which, under pretence of suppressing the Huguenots, aspired to the supreme power. After the assassination of the Duke of Guise, in December 1588, D'Aumale and the Duke of Mayenne became the heads of their party. D'Aumale in 1589 took possession of Paris, from which King Henry III. had been obliged to retire, when he dissolved the parliament by force, and sent its members to the Bastille. Shortly afterwards he marched from Paris with 10,000 men to attack the town of Senlis, but was defeated by La Noue. For a short time he defended Paris against the forces of Henri IV., who, after the assassination of Henri III., succeeded to the crown. After the surrender of Paris to Henri IV., D'Aumale joined the Spaniards, who had invaded the province of Picardy, for which he was declared guilty

of high treason by the parliament of Paris, and sentenced to be broken on the wheel, which sentence was executed in effigy the 24th of July 1595. From this period D'Aumale resided abroad, chiefly in Flanders, enjoying the favour of the Spanish government; and he died at Brussels in 1631. (Laoretelle, *Histoire de France pendant les Guerres de Religion*.)

AUNOY, or AULNOY, MARIE CATHERINE, COMTESSE D', was the daughter of M. le Jumel de Berneville, and allied to many of the first families of Normandy. She was born about 1650. After the death of her father, her mother married the Marquis de Gadaigne, and resided at the court of Madrid. Mademoiselle de Burneville became the wife of François de la Mothe, count d'Aunoy. The countess was a distinguished ornament of the French court, as her aunt, Madame Desloges, had been before her. She possessed great facility in composition, and formed one of a coterie of court ladies, who contributed very considerably to the light literature of their day. The Countess d'Aunoy died at Paris in January 1705, leaving behind her four daughters, one of whom, Madame de Hère, sustained the family reputation by her wit and talents.

The literary fame of Madame d'Aunoy has been preserved to our own day almost entirely by her 'Fairy Tales.' They are of the class of composition introduced into France at the close of the 17th century by Charles Perrault. The wit and vivacity of the Countess d'Aunoy have secured for many of her tales a degree of popularity in which they are surpassed only by those of Perrault himself. Among the numerous productions of the countess we meet with one, at least, 'The White Cat,' which rivals in estimation the best works of her master; and several more, such as 'The Yellow Dwarf,' 'Cherry and Fair Star,' and 'The Fair One with the Golden Locks,' which stand first in the second rank. For the groundwork of her stories, Madame d'Aunoy did not rely on her own invention; like Perrault, she resorted for her plots to Italian sources, principally the 'Pentamerone' of Basile, and the 'Piacevoli Notti' of Straparola, both of which had not long before been translated into French. The germ of one of her stories, 'Gracieuse et Percinet,' may be found in the Cupid and Psyche of Apuleius, and other fairy legends have been traced even to a remoter origin. From whatever source the material was derived, the French writers seem to have formed the mould which has given shape to the fairy fiction of Europe. The writings of Madame d'Aunoy have been much turned to account by writers for the stage, especially in our own country, where they have formed the groundwork of many of the most successful pantomimes, spectacles, and extravaganzas which have been produced.

The first series of Madame d'Aunoy's 'Fairy Tales' was published at Paris, in 4 vols., 12mo, in 1698, the year after the appearance of Perrault's volume. The 'Nouveaux Contes des Fées,' and 'Les Fées à la Mode, ou le Nouveau Gentilhomme Bourgeois,' rapidly followed, completing her writings of this kind. The whole are reprinted in vols. iii., iv., and v. of the collection called the 'Cabinet des Fées.' The principal tales have run through numberless editions, and it would be an impossible task to give a list of the translations of them into various languages, or even into our own. The translation however by J. R. Planché into English deserves a special exception for its excellence. Mr. Planché has also the merit of being the best adapter of them to the purposes of the modern stage.

Madame d'Aunoy was a voluminous writer in another line of fiction—the sentimental novel. Her principal work of this class, 'Hippolyte, Comte de Douglas,' originally published in 1696, is still sometimes read, and a new edition appeared at Paris in 1810. It is a miserable production in every respect. Madame d'Aunoy's two other novels, 'L'Histoire de Jean de Bourbon, Prince de Carency,' and 'L'Histoire du Comte de Warwick,' are of similar character. In the 'Mémoires de la Cour d'Angleterre,' the countess carried the system of mixing truth and falsehood to a still greater extent than even in her novels. The book opens with an apparently serious sketch of the court of Charles II., in which the writer boasts of her intimacy with "Le Duc de Bouquinkam," "my Lady Heyde," and other real personages of the time, and declares her intention to detail some of the most remarkable incidents of their lives. The work is then almost immediately transformed into a commonplace amatory romance, in which half the characters are decorated with the real names which the authoress has chosen to pitch upon, while the other half, with much greater propriety, are distinguished by the merely fanciful names usually bestowed on the heroes and heroines of romance. The 'Mémoires de la Cour d'Espagne,' and the 'Voyage d'Espagne,' are both so written that it is impossible to tell where truth ends and fiction commences. The same objection extends even to the countess's works of a more decidedly serious complexion, especially to her 'Mémoires Historiques de ce qui s'est passé en Europe, depuis 1672 jusqu'en 1679, tant aux guerres contre les Hollandois, qu'à la paix de Nimègue,' 2 vols., 8vo, Paris, 1692, a work not at all to be depended upon.

(Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge*.)

AURELIANUS. This emperor is usually known as Lucius Domitius Aurelianus, but on at least one coin he is named Claudius Domitius, while in a letter addressed to him by the emperor Claudius (whom he succeeded), he is called Valerius Aurelianus. It is probable

that he assumed the names of Claudius and Domitius after his accession to the empire. He was born probably about A.D. 212, it is commonly said, at Sirmium in Pannonia; but some say in the Lower Dacia (Ripensis), and others in Moesia. His father was a husbandman; his mother priestess of a temple of the sun. At an early age he enlisted as a common soldier. Tall, handsome, and strong, skilful and diligent in all athletic and military exercises, temperate in his habits, and of acute intellect, he rose from his humble station to the highest military offices during the reigns of Valerian and Claudian. In 256 he was commissioned by Valerian to make a general visitation of the military stations, and in 258 he was for his services named consul by the same emperor. He was distinguished by the soldiers from another Aurelian, also a tribune, by the characteristic epithet 'sword in hand' ('*manu ad ferrum*'). As an officer his discipline was strict even to severity, and he treated as a serious offence the least act of theft or extortion. On the death of Claudius, honourably distinguished by the appellation of Gothic, in 270, Quintilius, brother of Claudius, assumed the purple, but resigned it by a voluntary death, at the end of seventeen days, on hearing that the legions of the Danube had raised Aurelian to the imperial dignity. The new emperor suppressed an inroad of the Suevi and Sarmatæ, and compelled them to retreat to the northern side of the Danube; but he withdrew the Roman troops from the province of Dacia, and thus doubly strengthened the frontier of the empire by rendering the Danube its boundary, and by abandoning a district too distant to be easily defended, and too thinly peopled to defend itself. While thus engaged, Aurelian was recalled to the north of Italy by an invasion of a German tribe, the Alemanni or Marcomanni. After various alternations of success, the force of the barbarians was entirely destroyed in 271. Aurelian then visited Rome, punished with a ferocious severity the authors of a sedition which had disturbed the city, and repaired the walls, including an additional space within their limits. The disturbance at Rome was owing to the Monetarii, or coiners, who appear to have had the management of the public coinage, which they had probably debased for the sake of their own profit. Aurelian afterwards issued a new and improved coinage.

Aurelian at this time was master only of the central portion of the Roman world. Spain, Gaul, and Britain owned in name the authority of Tetricus; but he was little more than a pageant of a monarch, and he himself invited Aurelian to relieve him from his splendid misery. A battle was fought near Châlons in Champagne, at which Tetricus betrayed his own army into a defeat, while he himself with a few friends took refuge with his more powerful competitor. (Vopiscus, cap. 32.) The west being secured, Aurelian betook himself to that war by the successful issue of which he is best known—the reduction of the great, flourishing, and short-lived city of Palmyra. [ZENOBIA.] Odenathus, who had raised his native city to this height of power, was dead, and had been succeeded by his widow, the celebrated Zenobia, a woman of accomplished tastes and masculine talents. On his march Aurelian, in passing through Illyria and Thrace, met and vanquished some of the barbarian hordes who invested the frontier provinces of the Roman empire. In Asia Minor and Syria many towns and districts submitted to him, or were subdued by his arms. The hostile armies met at Emesa in Syria, where Aurelian gained a decisive victory, and continued his march to Palmyra unopposed, except by the constant attacks of the 'Syrian robbers.' The resistance of the city did credit to its warlike fame. Vopiscus has preserved a letter from Aurelian himself, in which he complains that the Romans talk of his waging war with a woman, as if she fought with her own unassisted strength, and continues:—"It cannot be told what preparation for war, what store of arrows, spears, stones, is here. No part of the wall but is occupied by two or three balistæ, and there are engines to cast fire. She does not fight like a woman, nor like one who fears punishment; but I trust that the gods will assist the republic, who never have been wanting to our undertakings." He offered favourable terms of capitulation, but a haughty answer was returned in the Syrian language by the queen, who threatened him with the promised help of the Persians, Saraceni, and Armenians. But Zenobia was disappointed in her expectations about these auxiliaries, and the skilful commissariat arrangements of the emperor obviated the difficulties of procuring subsistence for an army in the inhospitable deserts which surround the oasis of Palmyra. When further resistance was seen to be hopeless Zenobia tried to escape, but was taken on her way to Persia. The Roman soldiers clamoured loudly for her death. Aurelian refused to shed female blood; but he took his revenge on those who had directed her counsels, among whom perished the celebrated Longinus, who had been Zenobia's instructor in Grecian literature. The city surrendered soon after the capture of its mistress in 273, and was treated with comparative clemency, being neither plundered nor destroyed. Aurelian was already returned into Europe when he heard that the Palmyrenians had revolted, and massacred the small garrison of 600 archers whom he had left in charge of their city. He returned in wrath, and exceeded even his usual ferocity in avenging this ill-judged insult. Most of the inhabitants, men, women, and children, were put to the sword. Aurelian was recalled a third time to the east by a rebellion in Egypt, excited by Firmus, a merchant who had acquired immense wealth by commerce in India. This was immediately quelled by the emperor's presence; and having now cleared the Roman empire of all rivals and pretenders to independence, and restored it to its ancient

limits, he returned to Rome, where he celebrated his various victories with a triumph of more than usual magnificence. Gibbon, with some other excellent modern authorities, make the rebellion which occurred in consequence of Aurelian's attempt to restore the coinage to its true standard, to have happened after his triumph; but the order of events, and indeed the whole chronology of Aurelian's period, is very confused.

After this ceremony the emperor visited Gaul and Illyricum; but his stay was short, for in a few months from the date of it we find him leading an army against Persia, to revenge the defeat and degradation of Valerian. On his march between Heraclea and Byzantium he was assassinated, in consequence of the treachery of one of his secretaries, named Mnestheus, whom he had threatened with punishment; and the emperor's threats were known seldom to be made in vain. The secretary forged a list of names—those of the chief officers of the army ostensibly devoted to death; and the restless character of Aurelian caused the fraud to be readily believed, and promptly acted on. The conspirators were those whose stations gave them a right to be near his person; he was murdered about the beginning of 275. He left a single daughter, whose descendants remained at Rome when Vopiscus wrote.

Aurelian is not ill-described by Eutropius as of a character "necessary on some occasions rather than loveable on any; but harsh on all." Yet he had many qualities noble and valuable in a ruler: he was frugal in his expenses, temperate in his pleasures, moderate in providing for friends and adherents, strict in preserving good order, and resolute in repressing speculation, and punishing those who grew rich on speculation and the spoils of the provinces. But these good qualities were obscured by a temper naturally harsh, and trained by a long and exclusive course of military service into total carelessness for the sufferings of others; inasmuch, that the Emperor Diocletian, himself not over inclined to compassion, said on that account that Aurelian was better suited to command an army than an empire. (Vopiscus, in the 'Historia Augusta'; Eutropius; Aur. Victor; Gibbon, c. xi.; Crevier, 'Histoire des Empereurs Romains,' vol. vi.) Vopiscus informs us (cap. i.) that his 'Life of Aurelian' was founded on Greek authorities (there having been no Latin history of Aurelian before his), and on the Journals and Campaigns of the emperor, which were then kept in the Ulpian Library at Rome.

Gold. British Museum. Diameter doubled.

AURELIUS ANTONINUS, MARCUS, was the son of Annius Verus and Domitia Calvilla. Verus traced his pedigree to Numa, and Domitia here to Malennius, a Salentine prince; the fathers of both were consuls. Aurelius was born on Mount Coslius, in Rome, on the 26th of April, A.D. 121, and was named Annius Verus. Hadrian, with whom he was a favourite from infancy, familiarly called him Verissimus, a distinction which he even then merited. To his natural disposition, habits, and early acquirements, which it is honourable to the emperor to have perceived and cherished, he owed his adoption into the Aurelian family by Antoninus Pius. Hadrian adopted Antoninus Pius on the condition that he should adopt Annius Verus, and also Lucius Verus, the son of a deceased favourite, L. Ceionius Commodus (called, after his adoption by Hadrian, Aelius Verus Cæsar), who was to have been his successor. [VERUS.] The father of Aurelius dying while he was young, his grandfather took charge of his education, and gave him every advantage which the age he lived in could afford. We learn from himself that he had masters in every science and polite art, whose names and qualifications he has most gratefully recorded, modestly attributing all his acquirements to their instruction and example, and whose merits he did not fail to reward when the means of so doing were in his power. (See Book I. of the 'Meditations.') Two of them were raised to the consulate. These men, therefore, were not only tutors, but models upon which the character of Aurelius was formed; the foundation of which however he piously says was laid by his parents. Most of his teachers were Stoics. One of the most distinguished of them, Rusticus, procured him a copy of the works of Epictetus, which confirmed his natural inclination to Stoicism, and became his inseparable companions. The life and writings of the emperor rank him, indeed, amongst the best teachers and brightest ornaments of the Stoical school. The work of Aurelius, in which he has most fully exhibited the rules and principles of Stoicism as he understood and practised it, is divided into twelve

books, and written in Greek, and is generally known by the name of his 'Meditations.' It appears to have been a private note-book, kept chiefly to aid him in self-examination. But the 'Meditations' contain also the history of his education, and a collection of rules, dogmas, theorems, comments, and opinions, put down as they were suggested by passing events, reading, or conversation. They may be considered as a supplement to Epictetus, and the two together form the best code of moral discipline left to us by the ancient philosophers. This book was first edited in Greek and Latin by Xylander, Zurich, 1558, then by M. Casaubon in 1643, much improved; but still more by Gataker, Camb. 1652, with some valuable tables of reference. Subsequent editions of it, and translations into most modern languages, are numerous. None of the English translations are above the merest mediocrity.

Aurelius passed through all the offices usually given to persons of his rank and pretensions, and as he most punctually attended to his duty in them, he obtained those facilities as a man of business for which he was remarkable. In his fifteenth year the daughter of Ceionius Commodus was betrothed to him by the desire of Hadrian, but the union was dissolved by Antoninus Pius after Hadrian's death. After the death of Hadrian he married his cousin Faustina, daughter of Antoninus Pius. Upon the death of Antoninus Pius in 161, he took the name of Antoninus, and immediately associated Lucius Verus with himself as partner in the empire: he also gave Verus his daughter Lucilla in marriage. Aurelius accepted the throne at the request of the senate, much against his inclination; but having accepted it, he never suffered his fondness for study and philosophic retirement to interfere with his public duty. A troublesome reign ensued, beginning with inundations, earthquakes, famine, and pestilence, causing universal distress, which it required extraordinary exertion to alleviate. The life of a man whose object was peace was almost entirely occupied by war, owing to former emperors having conquered more countries than they could unite in one empire. He felt however that the safety of the empire depended upon its keeping all its provinces, for if its inability to do so could be proved, common cause would be made against it, and its destruction would follow. Aurelius by his activity, fortitude, and a prudent choice of his lieutenants, suppressed the insurrections that broke out in all quarters: he was everywhere victorious; and he took the best means in his power to make his victories effective, by showing mercy and clemency to the conquered.

The calamities in Italy were not ended when the Parthian war broke out; Verus took the command in this war, and returned victorious, A.D. 166, but brought the plague with him to Rome. [VERUS.] Calpurnius Agricola was sent against the Britains, who threatened insurrection; and Aufidius Victorinus against the Catti. The two emperors soon after marched together against the Marcomanni, and obliged them to sue for peace. In returning from this expedition Verus died, A.D. 169. In the year 170 Aurelius had to make war against the German nations. The preparations for the German war were commensurate with the importance of the undertaking, and even slaves and gladiators were enrolled among the troops. The details of these wars are not well recorded; but we know that the emperor showed himself a brave soldier, a skilful general, and a humane man. He drove the Marcomanni out of Pannonia, and also the Sarmatians, Vandals, and Quadi. The Marcomanni were almost annihilated while they were retreating across the Danube; and Dion (71, c. 7) makes the same statement as to the lazygæ, and describes a victory over them obtained by the Romans on the frozen river. During this expedition Aurelius resided for three years at Carnuntum on the Danube. The great event of the German wars was the battle with the Quadi, 174, in which the emperor and his army were saved by a miracle. It was in the heat of summer, while the emperor was carrying on the campaign against the Quadi, probably in the country north of the Danube, that the Romans were hemmed up in a dangerous position by the enemy, and were in danger of perishing of thirst. On a sudden the clouds collected, and a copious shower descended to refresh the exhausted soldiers, whom the barbarians attacked while the Romans were more intent on satisfying their thirst than on fighting. The army would have been cut to pieces if a shower of hail accompanied with lightning had not fallen on the Quadi. Thus fire and water came down at the same time, fire on the barbarians and water on the Romans; or if the fire came on the Romans, it was quenched by the water; and if the water fell on the barbarians, it only added fuel to the fire, as if it had been oil. The Romans gained a great victory, and Aurelius, who was saluted Imperator for the seventh time, shortly afterwards assumed the title of Germanicus, which appears on his medals. He wrote, says Dion, an account of this miraculous deliverance to the senate; and there is now extant a letter of Aurelius in Greek, addressed to the senate, which commemorates this event.

The miracle is mentioned by all the authorities who mention the battle; but the heathen writers give the credit of it to their false gods, and the Christian writers attribute it to the intercession of the Christian soldiers in the emperor's army. Apollinarius, bishop of Hierapolis, a contemporary of Aurelius, is cited by Eusebius as evidence for this; but Eusebius does not give his words. It is said that there was a legion of Christian soldiers in the army, called the legion of Melitene; and Apollinarius, according to Eusebius, adds, that in consequence of their services on this occasion the emperor

gave the legion the title of the Thunderbolt; and Xiphilinus, the epitomator of Dion, says the same. But the twelfth legion had this name at least as early as the time of Trajan. Tertullian also speaks of a letter which the emperor wrote, in which he ascribed the miracle to the prayers of the Christians. Tertullian speaks of the letter as if he had seen it; yet Lardner infers just the contrary from his words. Eusebius has no information on the matter of the letter, except what he gets from Tertullian; and other writers speak of the letter as existing, but without being more particular. A letter in Greek, which is extant, and printed after the 'Apologies' of Justin, is admitted not to be genuine by the best critics, even among those who maintain the truth of the miracle, and that it was due to the prayers of a Christian legion. The matter is worth notice, as it has always been, and still is, a subject of controversy.

The German war was interrupted by an event which in an especial manner called forth the clemency, justice, and sound policy of Aurelius. This was the rebellion of Cassius, a brave and skilful general, high in the confidence of the emperor, who, after an unsuccessful attempt to get possession of the imperial power, was put to death by his own officers (A.D. 175). Aurelius would not extend the usual penalties to his family, nor suffer many of his accomplices to be punished. He left the whole matter to the senate, recommending the greatest clemency towards the guilty. [CASSIUS, AVIDIUS.]

After the death of Cassius, the emperor made a journey into the east. In his visit to Lower Egypt and Syria, he conciliated the goodwill and affection of his various subjects by his kindness and his affable manners. During his return through Asia Minor, his wife Faustina, who accompanied him, died at a place called Halale, at the foot of Mount Taurus. Though her infidelity to the emperor was generally believed, Aurelius lamented her loss as if she had been the best of wives; and the senate, in the usual style of adulation, decreed a temple to her memory; raised her to divine honours with the title of Diva; and decreed that silver statues of Aurelius and Faustina, and an altar, should be erected, at which all the girls of the city at their marriage should sacrifice with their husbands. It is only fair to mention, in opposition to the accounts of Capitolinus and Dion Cassius, that the emperor in his 'Meditations,' i. 17, extols the obedience, affection, and simplicity of his wife.

At Smyrna, the emperor witnessed a display of the rhetorical talents of Aristides, who pronounced on that occasion his declamation in praise of Smyrna, which still exists among his works. Two years afterwards, when Smyrna was ruined by an earthquake, Aristides prevailed upon Aurelius to extend to its suffering inhabitants the same bounty that he had already bestowed on other cities. [ARISTIDES; ÆLIUS.] From Smyrna Aurelius passed to Athens, where he appears to have been admitted into the sacred mysteries of Ceres. During his reign he showed his affection to this ancient seat of learning by founding chairs of philosophy for the four chief sects, the Platonics, Stoics, Peripatetics, and Epicureans; and also a professorship of rhetoric.

The close of the philosophical emperor's life was not spent in the peaceful retirement which he loved, but in the midst of a northern campaign against the Marcomanni, Hermundurians, Sarmatians, and Quadi. His son Commodus accompanied him during these campaigns, which appear to have lasted between two and three years. Aurelius died, A.D. 180, after a short illness, at Vindebona (Vienna), in his fifty-ninth year, having reigned ten years alone, and nine with his colleague. His loss was regretted by the whole empire; he was ranked amongst the gods, and every house in Rome had his statue or picture. One of the medals that we have given, bearing the inscription CONSECRATIO, represents the apotheosis of Aurelius.

Brass. British Museum. Actual size.

A question which has excited much discussion is that of the share which Aurelius had in the persecution of the Christians. During the time of Aurelius, Justin and Polycarp suffered death for their religion, and the persecutions raged at Lyon in France with great fierceness. There is no doubt that Aurelius was acquainted with the Christians and with their doctrines in a general way. He speaks of them in his 'Meditations' (xi. 3), as persons who were ready to die from mere obstinacy: a passage which seems to prove that he knew that they had been put to death. The sufferings of the martyrs of Lyon are told at great length by Eusebius, and though there are manifest absurdities and exaggerations in the narrative, there is no reason to doubt the main facts. Justin was executed at Rome, but it is not agreed in what year. Justin and his associates were required by the præfect to sacrifice to the gods, and on their refusal were sentenced to be whipped and beheaded, pursuant to the emperor's edict—an expression which seems to have been sometimes misunderstood, and taken to signify that the emperor sat in judgment. ('Acta Martyris Justinii,' Justinus, 'Opera,' ed. Haag, fol. 1742.) It is difficult to reconcile the behaviour of Aurelius towards the Christians with the general humanity and kindness of his character. There is indeed no satisfactory evidence of any edict being published by him against the Christians, and the persecutions of Smyrna and Lyon were carried on in places distant from Rome. Still it cannot be doubted that he was well acquainted with what was going on in the provinces, and he must have heard of what took place at Lyon and Smyrna. There is no evidence that Aurelius encouraged these persecutions; nor is there any evidence that he prevented the persecutions or punished those who were most active in them. Aurelius did not like the Christians, and he may have thought their assemblies dangerous to the state. Those ecclesiastical historians who have judged him the most severely have judged him unfairly; and yet the admirers of Aurelius will find it difficult to give a satisfactory explanation of the sufferings of the Christians in his time.

(Capitolinus, *M. Ant. Philosophus*; *Dion Cassius*, lib. 71; Fabricius, *Bibliotheca Græca*, v. 500; Tillemont, *Histoire des Empereurs*, &c.)

AURELIUS VICTOR. Four books are commonly published together under the name of Aurelius Victor. 1. 'Origo Gentis Romanæ,' an imperfect work, beginning with Janus and Saturn, and going down to the foundation of Rome. 2. 'De Viris Illustribus Urbis Romæ,' which contains short biographies of the most illustrious Romans, with a few foreigners, from Romulus down to Pompeius. 3. 'De Cæsariibus,' which contains the lives of the emperors, from Augustus to the appointment of Julian to govern Gaul, A.D. 356. 4. 'De Vita et Moribus Imperatorum Romanorum,' or 'Aurelii Victoris Epitome,' another history of the emperors, from Augustus to the death of Theodosius the Great, A.D. 395.

That all these are not written by the same person is generally acknowledged; by whom they are written it is harder to say. It is pretty well agreed that the 'Origo' is not written by the same person as the 'Illustrious Men,' or the 'Cæsars;' and some persons, on very slight grounds, have attributed it to Asconius the critic. The 'Illustrious Men' has been variously ascribed to Cornelius Nepos, Pliny the Younger, Suetonius, and the true Aurelius Victor, who is the undoubted author of the 'Cæsars.' Of his life we know hardly any thing; he tells us ('De Cæs.' xx. 5) that he was "born in the country, of a poor and unlearned father," and it is conjectured, from his abundant praises of Africa, that he was a native of that province. The 'Cæsars' seems, on the evidence of a passage written in the present tense, to have been composed about the year 359; and there are other grounds for supposing that Victor was alive at that time. It is said in 'Amnianus Marcellinus' (xxi.) that the emperor Julian "appointed Victor the historian præfect of Pannonia Secunda, and honoured him with a brazen statue," and that some time after he was made præfect of the city. An extant inscription shows that Aurelius Victor was præfect of the city in the reign of Theodosius; and it is probable that these two notices refer to the same person. An Aurelius Victor was consul with Valentinian in 373. The 'Epitome' extends to the death of Theodosius. In all the titles prefixed to the manuscripts it is mentioned as 'Epitome ex libris,' 'Breviatus ex libris,' Sext. Aur. Victoris; and it agrees for the most part very closely with the 'De Cæsariibus,' but, as noticed above, is brought down some forty years lower. Neither the style nor the contents of these books entitle the author to a high place among historians. The most important portion is that which contains the history of the empire, where the frequent want of all contemporary authority renders a continuous sketch, even though it be a meagre one, of the more value. The editions of Aurelius Victor are numerous; among the best are the Delphin, and those of Schott, Gruner, Arntzenius, Schoenberger, and Schroeter. Valpy's Delphin edition (vol. i.) contains a collection of notices from various writers concerning the life of Victor, and the authorship of the works bearing his name.

(Moller, *Disputatio de Aurelio Victore*, Altdorf, 1805.)

AURUNGZEBE was the last powerful and energetic sovereign that ruled over the Mogul empire of Hindustan during the latter half of the 17th century. His proper name was Mohammed; but his grandfather gave him the surname Aurungzebe (properly Aurang-zib), that is, 'the ornament of the throne;' and when he became emperor, he assumed the titles of Mohi-eddin, that is, 'the reviver

of religion,' and Alem-gir, that is, 'the conqueror of the world.' Aurungzebe was the third son of Shah-Jehan, the son and successor of the celebrated emperor Jehan-gir. He was born on the 22nd of October 1618, and had just attained his tenth year when, upon the death of Jehan-gir, his father ascended the throne (1st of February 1628). Aurungzebe appears from an early age to have aspired to the throne of the Moguls; but he concealed his ambitious designs under an assumed air of piety and devotedness to religious duties. During the last eight years of Shah-Jehan's reign, Aurungzebe was intrusted with several high offices in the state, both military and civil, in the discharge of which he was distinguished alike for his valour and his diplomacy. At length, in 1657, the Emperor Shah-Jehan was seized with an illness so serious as to leave no hope of his recovery. His four sons, the eldest of whom was in his forty-second year, the youngest about thirty years of age, now allowed their mutual jealousies to have full scope. Dára, the heir apparent, was a high-spirited and generous prince, liberal in his opinions, and had he lived, it is probable that he would have trodden the footsteps of his great-grandfather, the illustrious Akbar. He had laboured to diminish the acrimony that existed between the followers of Mohammed and Brahma; and had written a work to prove that the two religions agreed in all that was good and valuable, and differed only in things that were of no real consequence. Availing himself of Dára's laxity of opinion, Aurungzebe avowed himself the champion of the 'true faith,' being well assured of the support of the priesthood. Of his brothers, Shujá and Múrad, he had less to fear, as neither of them was very popular; the former being of the Shiá sect, and devoted to the forbidden juices of the grape; and the latter, though brave, addicted to low and sensual pleasures. The illness of Shah-Jehan being considered mortal, Dára on taking the reins of government, acted very precipitately towards his brothers, of whom Shujá was then governor of Bengal, Aurungzebe of the Deccan, and Múrad of Guzerat. All communication with them was interdicted on pain of death; and their agents, papers, and effects at the capital were seized by his order. Shujá at once took up arms. Aurungzebe's policy was, in the first place, to allow Dára and Shujá to exhaust their strength and resources against each other; and secondly, to play off Múrad against the victor. He accordingly persuaded Múrad that his own views were entirely directed to heaven, not to a throne; and that for the sake of old affection, and for the promotion of the true faith, he was desirous to aid Múrad to his father's throne. Meanwhile Shujá was defeated near the town of Mongeer by Suleimán, Dára's eldest son, and at the same time intelligence arrived of the advance of a powerful army from the south, under the joint command of Aurungzebe and Múrad. The imperial army, flushed with success, was immediately led against the rebels, but Aurungzebe's valour and policy prevailed. Dára soon after led his whole forces in person against his two brothers, but his principal generals being gained over by the intrigues of Aurungzebe, his army was totally routed, and he himself compelled to seek shelter in the city of Agra. But the aged emperor Shah-Jehan had in the meantime in some degree recovered from his illness. He was well aware of Aurungzebe's crafty and ambitious character; and with the hope of drawing him into his power, he affected to overlook all that had passed, and to throw the whole blame on his eldest son Dára. Aurungzebe, on the other hand, affected the utmost loyalty, and under pretence of paying a visit to his father, in order to obtain his blessing and forgiveness, he at the same time gave instructions to his son Mohammed, who, with a select body of troops, took possession of the palace, and thus the aged monarch became a prisoner for life. Aurungzebe now seized and confined his brother Múrad; and Dára and Shujá, after a vain struggle of two or three years' continuance, were also secured; and all three were put to death. Thus the throne of the Great Mogul became the undisputed possession of the crafty usurper, who however for some time affected to require importuning before he would accept the imperial diadem. At length in the garden of Izzabad, near Delhi, on August the 2nd, 1678, Aurungzebe submitted to receive the insignia of royalty, assuming at the same time the pompous title of 'Alem-gir, or "conqueror of the world." It must be confessed however that Aurungzebe's long reign of half a century, notwithstanding the dishonourable means by which he acquired the sovereign power, was upon the whole distinguished for its prosperity. From the time that he was firmly established on the throne, the vigilance and steadiness of his administration preserved so much internal tranquillity in the empire, that historians have recorded few events worthy of notice. The great drawback to the permanent well-being of the empire, was the intolerant spirit of the ruling power, and the general want of confidence which the perfidy and insincerity of the emperor had engendered. Even his own sons seemed to emulate him in disobedience to their father and distrust of each other. Of all his nobles, the one he dreaded most was Amir Jumla, with whom he had been connected in frequent intrigues in the Deccan, and by whose instrumentality he had been enabled to ascend the throne. On his accession, Aurungzebe appointed this able man governor of Bengal; but to keep him in employment he recommended to him an invasion of the kingdom of Asam, whose ruler had broken into Bengal during the distractions of the empire, and still remained unchastised. Jumla, who promised himself both plunder and renown from this expedition, immediately undertook the task; but after several victories on the

part of the Mogul troops, they were compelled to return, their number greatly reduced by unfavourable weather and the violence of a disease to which their leader at the same time fell a victim. On hearing the news, the emperor remarked to the son of Jumla, whom he had recently made commander-in-chief of the horse, "You have lost a father, and I have lost the greatest and most dangerous of my friends."

In the third year of Aurungzebe's reign a severe famine, by which the empire was visited in consequence of an extraordinary drought, gave occasion for the manifestation of the nobler features of Aurungzebe's character. He remitted the rents and other taxes of the husbandmen; he opened his treasury without reserve, and employed its ample funds in purchasing corn in those provinces where it could be obtained, and in conveying it to such places as were most in want, where it was distributed among the people at very reduced prices. At his own court the utmost economy was observed, and no expense was allowed for luxury and ostentation. From the day he began to reign he had himself so strictly superintended the revenues and disbursements of the state that he was now in possession of ample resources, which he applied to the relief of his people. In the seventh year of Aurungzebe's reign his father Shah-Jehan died; and though the life of the aged monarch had reached its natural period, yet Mill and some other able historians have expressed their suspicion that his death was occasioned by a draught of the pousta, a species of slow poison; but the suspicion is unsupported by good contemporary authority, and there appears little reason why at such a time Aurungzebe should have added to the list of his crimes that of parricide. During the whole reign of Aurungzebe the northern part of India, which constituted the Mogul empire under Akbar, continued in a peaceful and apparently flourishing state; but the bigotry and illiberal policy of the ruler towards his Hindoo subjects roused a powerful enemy in the south, which ultimately triumphed over the proud house of Timur. The Mahrattas for the first time began to show a formidable aspect under the guidance of the renowned chief Sevaj, who had been originally a leader of plunderers inhabiting the mountain districts between Canara and Guzerat. He had acquired considerable power and influence during the civil wars that desolated the country at the commencement of Aurungzebe's reign. He at first tendered his allegiance to the usurper, and was invited to court, where he was loaded with insults, and virtually, though not literally, imprisoned. With great address he managed to effect his escape, and, in conjunction with other chiefs of his nation, devoted the remainder of his life to the prosecution of a harassing and successful guerilla war against Aurungzebe.

As he advanced in years Aurungzebe gradually withdrew from his Hindoo subjects that toleration and kindness which had so endeared to them the beneficent reign of Akbar and his two successors. He laid upon them a heavy capitation tax called the 'jazia,' and his pious zeal rioted in the destruction of their ancient and magnificent temples, and in offering every insult to their religious feelings. By this ill-judged procedure he completely forfeited the allegiance and affections of the Rájputs, a brave, proud, and high-spirited class of Hindoos, occupying the central provinces of the empire. When acting as governor of the Deccan under his father, Aurungzebe had employed his talents in exciting discords and intrigues between the Mohammedan kings of Bijapúr and Golconda. These kingdoms, in the course of his reign, he was enabled to seize and add to his already overgrown empire.

The latter years of the powerful monarch were passed in misery. He was suspicious of every one around him, and more particularly of his own children. The remembrance of Shah-Jehan, of Dára, of Shujá, and of Múrad, now haunted him everywhere. How much he was influenced by remorse for his share in their fate it is difficult to say, but his actions sufficiently showed how much he feared that a like measure might be meted out to himself. He expired in the city of Ahmednuggur on the 21st of February 1707, in the eighty-ninth year of his life and fiftieth of his reign. Under Aurungzebe the Mogul empire had attained its utmost extent, consisting of twenty-one provinces, with a revenue of about forty millions sterling. Yet with all this outward show of prosperity the heart of the state was thoroughly diseased. This was mainly owing to the character and conduct of the ruler, whose government was a system of universal mistrust, every man in office being employed as a spy on the actions of his neighbours. This cooled the attachment of his Mohammedan nobles, while the Hindoos were estranged by his intolerance to their religious system. It is a curious fact that in the eleventh year of his reign Aurungzebe imposed the strictest silence on all the historians within his realm, "preferring," as it is said, "the cultivation of inward piety to the ostentatious display of his actions." Yet to this very prohibition we are indebted for the best and most impartial Indian history extant. Mohammed Hashim, a man of good family residing at Delhi, privately compiled a minute register of all the events of this reign, which he published some years after the monarch's death, in the reign of Mohammed Shah. This work is a complete history of the house of Timur; giving, first, a clear and concise account of that dynasty, from the founder down to the close of Akbar's reign. The great body of the work is occupied with the hundred and twenty years that succeeded the death of Akbar, where all the important occurrences of each year are fully detailed. Mohammed Shah was so pleased with this history that he ennobled the author with the title of Kháfi Khan (the word kháfi denotes 'concealer'). This valuable work became

known in Europe on the publication of the 'History of India' by the Honourable Mountstuart Elphinstone, in which the author, an accomplished Oriental scholar, has narrated himself of Khafī Khān's history, and the result is a complete narrative of the reign of Aurungzebe and his immediate successors. An excellent account of the commencement of this monarch's reign will be found in Bernier's 'Travels in the Mogul Empire.' The author, a well-educated Frenchman brought up to the medical profession, passed twelve years in India, during eight of which he acted as physician to Aurungzebe.

(Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge*.)

AUSONIUS, DECIMUS MAGNUS, was born at Burdigala, Bourdeaux, some time early in the 4th century. His father Julius Ausonius was a distinguished physician, eminent also for his acquaintance with Grecian literature. The son was brought up with great care by his maternal uncle. When about thirty Ausonius was employed to teach grammar in the schools of Bourdeaux, and soon after was appointed professor of rhetoric. He was naturally attached to that city; and has celebrated in a book of poems ('Commemoratio Professorum Burdigalensium') all those who had taught in the schools of Bourdeaux, and those natives of the place who had filled professorships elsewhere. In A.D. 369 his reputation caused him to be selected by the emperor Valentinian as tutor to his son Gratian. This connection naturally led to his promotion; and he was appointed prætorian prefect of Italy in 377, and of the Gauls in the following year, and made consul by Gratian in 379. After the death of Gratian he withdrew from public life: and appears to have spent his last years in a rural retreat near his native place. The date of his death is not known. That he was alive in 388 is shown by his mention of the victory of Theodosius over Maximus. He is believed to have died about 394. His son Hesperus rose to the highest dignities of the empire: his daughter was successively the wife of two men of rank.

The poetical talents of Ausonius were highly esteemed during his life: and the emperor Theodosius wished to obtain the same return of flattery from him which Augustus received from Horace and Virgil. But his style is vicious and full of conceits, and his subjects generally too trifling to retain any interest. He wrote 'Epigrams,' which contain more indecency than originality; 'Ordo Nobilium Urbium,' a series of short poems on eminent cities: 'Idyllia,' of which the best are—'Cupid Crucified,' and the 'Moselle,' perhaps the oldest specimen of a descriptive poem extant; 'Epistolæ;' 'Gratiarum Actio,' an address of thanks, in prose, to Gratian, which contains many of the particulars of his life. Ausonius appears to have been a Christian, though many critics have thought otherwise, but some of his writings do little credit to his profession. Of the numerous editions of this author, the Delphin, by Father Souchay, is recommended as the best. The Variorum, 1671, and Bipont, 1785, may also be recommended.

AUSTEN, JANE, was born December 16, 1775, at Steventon in Hampshire, of which place her father was rector. Mr. Austen was himself a man of more than average literary acquirements, and he bestowed upon Jane an education superior to what was then general among females of her rank in society; though she was perhaps deficient in what are termed the accomplishments, which usually constitute so large a portion of female education. She was possessed of considerable beauty, both of features and person, with sweetness of disposition, good sense, and a remarkably engaging manner. During the latter years of Mr. Austen's life she resided chiefly at Bath, but after his decease his widow and her two daughters retired to Southampton, where they continued till May 1817, and afterwards to the village of Chawton, where Jane wrote her novels. There they remained until her declining health rendered it desirable that they should remove to Winchester for the sake of better medical advice. She died July 24 of that year, and was buried in the cathedral.

Miss Austen's novels were published anonymously, but soon attracted the attention which their great merits deserved. 'Sense and Sensibility' appeared in 1811, and soon after the authoress was agreeably surprised at receiving 150*l.* from its profits. 'Pride and Prejudice,' 'Mansfield Park,' and 'Emma,' succeeded at regular intervals—the last in 1816. Her name was first affixed to 'Northanger Abbey' and 'Persuasion,' which were published together, after her death, in 1818. 'Northanger Abbey' was her earliest and feeblest production. 'Persuasion' was her latest composition, and, in many respects, her best. The whole series was reprinted in 1833 in Bentley's 'Standard Novels.'

The novels of Miss Austen are all of the domestic class, and consist of delineations of every-day English life and actual society in the middle ranks, and chiefly in the country or in provincial towns. The truth of her dialogue, the thorough preservation of character in every action and in every speech of her dramatis personæ, would almost induce a belief that her scenes were transcripts from actual life, but for the art with which it is finally found that they are made to conduce to the working out of a plot, which in all her novels, but her earliest, appears to have been fully constructed in the author's mind before the first page was written. Her characters are never of an extraordinary kind, either morally or intellectually; her pages are equally free from the very witty and the very absurd; she shows no power of delineating external nature; she has no broad

humour, and (except perhaps in 'Persuasion') no deep pathos. In a letter to a friend, she herself compares her productions to "a little bit of ivory, two inches wide," on which, according to her own account, "she worked with a brush so fine as to produce little effect after much labour." Her works are in fact exquisite miniatures, and Miss Austen the most lady-like of artists.

The whole of Miss Austen's works have been translated into French. The 'Quarterly Review' (vol. xxiv.) contains an elaborate criticism on Miss Austen, written by Dr. (now Archbishop) Whately.

(Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge*.)

AUSTEN, WILLIAM, an English metal-founder of the 15th century. A very interesting document respecting Austen and other artists has been preserved by Sir William Dugdale in his 'Warwickshire.' Austen had a great share in the construction of the celebrated tomb in St. Mary's church, Warwick, of Richard de Beauchamp, earl of Warwick, who died in 1439. This document, which is the covenant between the earl's executors and the artists to be employed in the construction of the tomb, states that "Will. Austen, citizen and founder of London, xiv. Martii 30 H. 6, covenanteth, &c. to cast, work, and perfectly to make, of the finest latten [brass] to be gilded that may be found, xiv. images embossed, of lords and ladies in divers vestures, called weepers, to stand in housings made about the tombe, those images to be made in breadth, length, and thickness, &c. to xiv. patterns made of timber. Also he shall make xviii. lesse images of angells, to stand in other housings, as shall be appointed by patterns, whereof ix. after one side, and ix. after another. Also he must make an hearse to stand on the tombe above and about the principal image that shall lye in the tombe according to a pattern; the stuffe and workmanship to the repairing to be at the charge of the said Will. Austen. And the executors shall pay for every image that shall lye on the tombe, of the weepers so made in latten, xviii. s. iv. d. And for every image of angells so made v. s. And for every pound of latten that shall be in the hearse x. d. And shall pay and bear the costs of the said Austen for setting the said images and hearse.

"The said William Austen, xi. Feb. 28 H. 6, doth covenant to cast and make an image of a man armed, of fine latten, garnished with certain ornaments, viz. with sword and dagger; with a garter; with a helme and crest under his head, and at his feet a bear mused [muzzled], and a griffon perfectly made of the finest latten, according to patterns; all of which to be brought to Warwick and layd on the tombe, at the perill [risk] of the said Austen; the executors paying for the image, perfectly mayd and layd, and all the ornaments in good order, besides the cost of the said workmen to Warwick, and working there to lay the image, and besides the cost of the carriages, all which are to be born by the said executors, in total xl. s."

In the opinion of Flaxman, these works of Austen are equal to what was done in Italy at the same time, although Donatello and Ghiberti were then living; and though Austen is mentioned in the covenant only as the founder, he was not improbably also the designer of the figures, as the patterns spoken of in the covenant may have been made in relation to size and costume, and general design—the models, in fact, prepared with the estimates, to be submitted to the parties at whose cost the tomb was constructed. The pay of 13*s. 4d.*, for making a brass figure appears small, but it was at that time the price of an ox. The tomb itself cost 125*l.*, the figure of the earl 40*l.*, and there was an additional expense of 13*l.* for gilding. The whole expense of the tomb and the chapel in which it is placed, called Beauchamp Chapel, was 245*l. 4s. 7d.* The other artists employed in this monument were—John Essex, marbler; Thomas Stevyens, coppersmith; John Bourde, of Corfe Castle, marbler; Bartholomew Lamspring, Dutch goldsmith, of London; John Prudde, of Westminster, glazier and painter on glass; John Brentwood, citizen and steiner, of London; and Kristian Coleburne, also a painter or steiner of London. The monument, one of the earliest and best in England, is still in a state of preservation, and is of brass; the meaning therefore of the word 'latten,' which has been disputed, is evidently brass. A cast of the monument is in the Crystal Palace at Sydenham.

(Dugdale, *Antiquities of Warwickshire*, p. 446.)

AUTOLYCUS, the mathematician, as Diogenes Laertius (who mentions him incidentally as one of the teachers of Arcesilaus) calls him, was a native of Pitane in Æolis, and lived somewhat before B.C. 300. Two extant works of his, 'On the Moving Sphere,' and 'On the Risings and Settings,' are the earliest Greek writings on astronomy, and the earliest remaining specimen of their mathematics. In the first of these works the simplest propositions of the doctrine of the sphere are enunciated and demonstrated; in the second (which is in two books) the risings and settings of the stars with respect to the sun are discussed. There is nothing, as Delambre remarks, which can serve as a basis for any calculation, much less any notion of trigonometry.

The only Greek text of Autolycus is that of Dasypodius, in his 'Sphericæ Doctrinæ Propositiones,' Strassburg, 1572, which contains several other writers, but gives (as was very common) only the enunciations of the propositions in Greek. There is an anonymous Latin version of the second work, Rome, 1563, 4to; a Latin version of both (of the first, 1587, of the second, 1588, Rome, 4to.) by Giuseppe Auria, from a Greek manuscript with notes by Maurolycus; a reprint

of the last, Rome, 1591, 4to., with 'cum scholiis antiquis' in the title; finally, Paris, 1644, 4to., in the 'Universæ Geometriæ Mixtaeque Mathematicæ Synopsis' of Mercenne, there is a version of Autolycus, by Maurolycus.

(*Biographical Dictionary of the Society for the Diffusion of Useful Knowledge.*)

AUZOUF, ADRIEN, was born at Rouen, but when is not known. He had established his reputation as an astronomer in 1666, and was one of the original members of the Academy of Sciences, founded in that year. He died in 1691 or 1693, at Rome. Auzout is celebrated as having, in conjunction with Picard, applied the telescope to the mural quadrant. This rests on an admission of Picard to Lahire (Montucla, ii. 569), asserted by the latter; but there is no mention of it in Picard's book 'On the Figure of the Earth.' Auzout also made an independent invention and application to the telescope of the moveable wire micrometer, on which he published a treatise in 1667. Picard assisted him in perfecting this instrument. Huyghens has been frequently stated as an inventor of this micrometer, but his instrument is different from, and inferior in principle to, that of Auzout. (Dlambre, 'Ast. Mod., Disc. Prelim.' p. 47.) The prior invention of Gascoyne is admitted, and was brought forward by Hooke and others of the Royal Society, in opposition to the invention of Auzout.

Auzout published observations and calculations of the comet of 1664, and the presentation of his results to Louis XIV. is said to have given that prince the first idea of founding an observatory at Paris. He also made a laborious comparison of the weights and measures of France and other countries, which is to be found, together with his own account of his micrometer, in the folio collection of Memoirs of the Academy, entitled 'Divers Ouvrages de Mathématique et Physique,' Paris, 1693. Among other results of the micrometer, he observed and measured the diurnal variation of the moon's diameter, first explained by Kepler. Besides the preceding works, we have left of Auzout a letter on some new observations of Jupiter and Saturn, Paris, 1664; and a letter to the Abbé Charles on a collection of observations published by Campani, Paris, 1665. Auzout was a good optician and maker of telescopes; and although the state of his health was never good, he did much for astronomy.

AVANZI, JA'COPO DI PAOLO D', a celebrated Italian painter of the 14th century, who lived at Bologna, but whether he was a Venetian or a Bolognese is doubtful. Jacopo was sometimes called Dalle Madonne, because he painted at one time almost exclusively Madonnas. Jacopo is generally mentioned in company with Simone da Bologna, or Simone de' Crocifissi, or Il Crocifissato, as he was called, for the same reason that Jacopo was called Dalle Madonne. They became partners, and each painted a part of their joint productions, a circumstance which has led to the error of treating them as of one family; Simone's name was not Avanzi, but Benvenuti, according to the manuscript of Oretti. Most of Jacopo's works have perished. The frescoes of the chapel of San Felice, formerly San Jacopo, in the church of Sant' Antonio at Padua, which were long attributed to Giotto, were painted by Jacopo in 1376. He painted also, in partnership with Simone, many frescoes in the old church of the Madonna di Mezzaratta, without the Porta San Mamolo at Bologna, which were much praised with reference to their time by Michel Angelo and the Carracci. Besides these Jacopo painted two triumphs in a public hall at Verona, and some works in company with Aldighieri da Zevio in the chapel of San Giorgio in the church of Sant' Antonio at Padua. The former were considered works of extraordinary merit by Mantegna; the latter were recovered from dirt and oblivion by Dr. E. Förster ('Kunstblatt,' pp. 16 and 22). Jacopo died probably in the early part of the 15th century. There are two pictures attributed to him in the gallery of Bologna. (Vasari, *Vite de' Pittori*, &c., and the *Notes* to Schorn's German translation; Malvasia, *Felsina Pittrice*; Lanzi, *Storia Pittorica*, &c.; Giordani, *Pinacoteca di Bologna*.)

AVEMPACE, or AVEN PACE, properly ABU-BEKR MOHAMMED-BEN-BAJAH, but better known in the East under the surname of IBN-AS-SAYEG, an Arabian philosopher and poet, was, according to the *Biographical Dictionary* of Ibn-Khallican, a native of Saragozza, or, according to Joannes Genesis Sepulveda, of Cordova. Of his life very little is known. He practised as a physician at Seville till the year 512 after the Hegira (A.D. 1119); then, after travelling some time, went to Fez, to the court of Yabya, Ibn-Tashefin, whose vizier he became. Here he died, according to Ibn-Khallican, in the year A.H. 533 (A.D. 1138), according to others in A.H. 525 (1130). Avempace was a learned and accomplished man. He is said to have known the Koran by heart, but to have entertained very free opinions respecting its divine authority, and several other points of the Mussulman faith. He wrote several short dissertations and essays on philosophical subjects, which were collected by Abu'l-Hasan-Ali, who preferred Avempace to all Mohammedan philosophers that had preceded him. Other more extensive works he left behind in an unfinished state; among these Ibn-Tophail notices a 'Treatise on the Soul,' one on 'Solitary Life,' another on 'Logic,' and on 'Natural Science.' Several of his works were known to the schoolmen by Latin translations, but no translation of any of his works appears to have been printed. The name Avempace, or Aven-Pace, is a corruption of Ibn-Bajah. (See *Philosophus Autodidactus, sive Epistola Abi Jaafar Ebn-Tophail*, ed.

Pocock, pp. 15-16, and preface; Nicol. Antonii, *Bibliotheca Hispana Vetus*, Rome, 1696, vol. ii. p. 232; D'Herbelot, *Bibliothèque Orientale*, art. Saieg.)

AVENBRUGGER. [AENBRUGGER.]

AVENTINUS, JOHANNES THÜRMAIER, the son of a publican, was born at Abensberg, in Bavaria, in 1478. He studied at Ingolstadt, and afterwards at Paris, where he took the degree of Master of Arts: he afterwards taught eloquence and poetry at Vienna, and Greek and mathematics at Kracow. In 1512 he was called to Munich by the Duke of Bavaria, who intrusted him with the education of his two sons. He then wrote, in Latin, his 'Annales Boiorum,' or History of Bavaria, which is much esteemed. In this undertaking, which entirely occupied sixteen years of his life, he had access to the best sources of information, as the various archives, and the libraries of convents, &c. were opened to him. He died in January 1534; but it was not until 1554 that his great work was permitted to be printed for the first time, and then the editor, Ziegler, suppressed all those passages which were directed against the popes or the Romish church. All these passages were however restored in the edition of 1580 by Cisner. Several other editions have been published; and it has also been published in German, but abridged. Aventinus wrote several other learned works; among the rest 'Numerandi per digitos manaque, quin etiam loquendi, veterum consuetudinis Abacus,' 4to, 1523; and 'Vita Henrici quarti Imperatoris cum ejusdem Epistolis,' 4to, 1518. This work is very rare.

AVENZOAR, or AVEN-ZOHAR (a corrupt form of Ibn-Zohr), is the name of two Arabian physicians, father and son, who flourished in Spain during the 12th century. They were Jews by descent and religion. The first and most celebrated of them is Abumeron Avenzoar, or with his complete name, and correctly written, Abu-Merwan Mohammed-ben-Abdu-l-Malek-ben-Zohar. He was born at Seville, or Peñafór, near Seville, about A.H. 465 (A.D. 1072-3). He was instructed in medicine by his father, and lived as a physician at the court of Ibrahim-ben-Yusuf-ben-Tashefin, the Almoravid sovereign of Morocco and Cordova. He died at Seville in the year A.H. 557 (1162). He is the author of several works on medicine, which were long held in high esteem; the most important of them is the 'Taisir,' or 'Introduction,' which is indeed one of the most valuable works of the Arabian physicians. A Latin translation of it made from an intermediate Hebrew version, has been printed repeatedly—for the first time by Joannes de Forlivo and Gregorius, at Venice, in 1490, along with the 'Colliget' of Averroes. A manuscript of the Arabic original of this work, besides a treatise on simple and compound medicines, which is likewise attributed to Avenzoar, is said to exist in the Bibliothèque du Roi, at Paris. Latin translations of several other works attributed to Avenzoar are enumerated by Nic. Antonius; among them we notice a treatise 'De cura calculi,' printed at Venice, 1497; and other, 'De regimine sanitatis,' Basil, 1618. Sprengel, after giving an account of the 'Taisir,' proceeds to observe that Avenzoar has done less to improve the theory than the practice of medicine. "Contrary to the custom of his countrymen, he was a declared enemy of sophisms and dialectic subtleties. Following the plan of his father, he intrusted himself to no other guide but experience; but in doubtful cases had often recourse to Galenus. He was not free from prejudice, and his practice sometimes approached to empiricism. Avenzoar was the teacher of the celebrated Averroes.

The younger Avenzoar, called by his Arabian biographers Alhafid, or the Descendant, was the son and pupil of the former. He was born at Seville, A.H. 507 (1114), and educated under the guidance of his father. He succeeded his father as chief physician to the sultan Abdu-l-Mumen, and held the same office under his son and grandson. Al-Mansur carried Avenzoar with him to Morocco, conferring on him additional honours. He died in Morocco, A.H. 595 (1199), having it is said been poisoned with his sister by the vizir of Al-Mansur, who was jealous of the favour he enjoyed with the sultan. According to Joannes Leo Africanus, he wrote, like his father, several works on medicine; among others, one on the treatment of the eyes.

(Nic. Antonii, *Bibliotheca Hispana Vetus*, t. ii. p. 232-235; Hottinger, *Bibliothecarius*, p. 269-271; Sprengel, *Histoire de la Médecine*, t. ii. p. 332-337; Casiri, *Bibliotheca Escorialensis*, t. ii. p. 232.)

AVERROES, or AVERRHOES, properly IBN-ROSHD, or with his complete name, ABUL-WALID MOHAMMED-IBN AHMED-IBN MOHAMMED-IBN-ROSHD, an Arabian philosopher and physician of great celebrity, was born at Cordova, where his father filled the high office of mufti or chief judge and priest of Andalusia. The date of his birth is commonly given as A.H. 543 (A.D. 1149), but if, as is said, he was very old at his death in A.H. 595 (1198), he must have been born much earlier. From various circumstances there can be little doubt that he was born in the first quarter of the 12th century. Some of the most distinguished Arabian scholars of the age are mentioned as his teachers. He studied Mohammedan jurisprudence under the guidance of his father; theology and philosophy under Ibn-Sayeg (Aven Pace) and Tophail; and medicine under Avenzoar, the father. His diligence was indefatigable: he devoted the greater part of his time to the study of philosophy and medicine, and turned to the perusal of works of history or poetry only by way of recreation. As a Mussulman theologian, Averroes adopted the creed of the Ashlari sect, the main principle of which is, that God, being the universal

cause of everything, is also the author of all human actions; but that, nevertheless, men bring free, either acquire merit or incur guilt according as they obey or disobey the precepts of religion. Averroes at first succeeded his father as mufti of Andalusia, and at the same time delivered lectures at Cordova. He was afterwards appointed chief judge of Mauritania; but being charged with having expressed heretical opinions, Averroes lost his office. He was compelled to make a public recantation; but was ultimately reinstated in his former office, which he continued to fill till his death. Two of his sons are said to have visited the court of the German emperor Frederic II.

Averroes entertained the highest respect for Aristotle, though in studying and translating his works he seems to have placed too much reliance on his commentators, Ammonius, Themistius, and others. The works of Averroes were very numerous. A list of them among the oriental manuscripts of the library in the Escorial, specifies not less than seventy-eight distinct treatises. Many of them were early translated into Latin, and studied by the schoolmen. An edition of Averroes in Latin was published at Venice, 1562, in eleven volumes, folio. His commentaries on Aristotle and on the 'Republic' of Plato seem to be the most generally known; but he composed likewise original treatises on philosophical subjects, and on Mohammedan theology and jurisprudence. Among his medical works, the 'Kulliyat' (that is, 'The Total,' or Comprehensive System) is the most important, a Latin translation of which, commonly called the 'Colliget Averrois,' has been repeatedly printed along with the 'Taisir' of Avenzoar, for the first time (it seems) at Venice, by Joannes de Forlivio and Gregorius, in 1490.

(Nic. Antonii, *Bibliotheca Hispana Vetus*, t. ii. pp. 240-248; Hottinger, *Bibliothecarius quadruparitus*, Figuri, 1664, 4to, p. 271-279; Sprengel, *Histoire de la Médecine*, trad. par Jourdan, vol. ii. p. 337-340; Wüstenfeld, *Geschichte der Arabischen Aertze und Naturforscher*, § 191.)

AVIANUS, FLAVIUS, the author of a collection of forty-two Æsopian fables in Latin elegiac verse, probably lived in the 5th century after Christ. Flavius Avianus has been frequently confounded with Rufus Festus Avienus [AVIENUS, RUFUS FESTUS]; but besides the great difference of their subjects, the whole mental character of the men and the style of their writings are wholly dissimilar. The only resemblance in fact is in their names. The fables are dull and feeble, and far from pure in style. The first separate edition of the 'Fables of Avianus' was printed by J. de Breda at Davenport, in Holland, in 1494; but they had been previously printed with the 'Fables of Æsop' about 1480. Caxton printed 'the Fables of Avian translated into Englyshe,' at the end of his translation of Æsop, in 1483.

AVICENNA, named ABEN SINA by Hebrew writers, but properly IBN-SINA, or, with his complete name, ABU ALI AL-HOSSEIN IBN ABDALLAH IBN SINA, called also by Arabian biographers AL-SHEIKH ('the Doctor'), and AL-RAYIS ('the Chief'), was a celebrated Arabian philosopher and physician, whose name has ruled in the realm of science during a longer period than that of any other writer, with the exception of Aristotle and Galen. He was, according to the biographical dictionary of Ibn-Khallican, born at Kharmatāin, a village near Bokhara, in the year A.H. 370 (A.D. 980). He received the elements of his education at Bokhara. He states in his autobiography, that when he had reached his 10th year he was thoroughly versed in the study of the Koran, knew something of the elements of Mussulman theology, of Hindoo arithmetic, and algebra. About this time Abu-Abdallah-Al-Natheli, a scholar of some note among his contemporaries, came to Bokhara, and Avicenna was placed under his tuition. He studied under him logic, Euclid, and the *Almagest*. When Al-Natheli left Bokhara, Avicenna, then about 16 years old, began to turn his attention to the study of medicine, but soon interrupted his medical pursuits to give another year and a half to a course of philosophical study. In his autobiography he informs us, that so great was the zeal with which he devoted himself to his studies, that during two years he never slept an entire night; if he was unable to find the solution of an intricate problem he went to the mosque to pray, and then seldom failed to overcome the difficulty. Before he had reached his 18th year, he had mastered his various studies; and about the same time he cured the Samanide Sultan of Bokhara, Nuh-ben-Mansur (who reigned A.D. 975-997), of a dangerous disease. In his 21st year he wrote a work, which Casiri styles an Encyclopædia (the Arabic title is 'Kitāb al-Majmū', that is, literally, 'The book of the sum total'). He subsequently compiled a commentary to it, which extended to about 20 volumes. When he was 22 years old, Avicenna lost his father, whom he succeeded for a short time in the office of minister to the Sultan of Bokhara; but after the downfall of the Samanide dynasty, which happened about the beginning of the 11th century, he quitted Bokhara. He was for a time attached as physician to the court of the Dilemite sovereign, Shams-ul-Ma'ali Kābūs ben Washmgr. When this prince was dethroned, which happened about 1012, Avicenna retired to Jorjan, where he began to write his celebrated treatise on medicine known under the title of the Canon ('Kitāb al-Kānūn fil-Tibb,' that is, 'Book of the Canon in medicine'). He subsequently lived for a time at Rai, Kazwin, and Hamadan. In the last place he was appointed vizir to Shams-eddaulah, the reigning sovereign of that

town. On the death of that prince Avicenna took up his abode at Ispahan, where he compiled several of his works. He was physician to Alā-eddaulah, then the sovereign of Ispahan, and accompanied him on a journey which that prince undertook to Hamadan. Avicenna, whose health had been previously weakened, had an attack of cholera on the road, of which he died shortly after his arrival at Hamadan, A.H. 428 (A.D. 1037). Casiri (vol. i. p. 299) notices a list of the works of Avicenna, in which 60 are enumerated; Ibn-Khallican states the total number of his great and short treatises at nearly 100, and mentions particularly the 'Shefā fil-bikmat,' the 'Nejāt,' the 'Ishārāt,' and the 'Kānūn': the titles of many others may be seen in Casiri (vol. i. p. 270). Among them, the 'Kānūn' acquired the greatest celebrity, and became, even in Europe, for many centuries the standard authority in medical science, chiefly on account of its judicious arrangement, and the comprehensive view which it afforded of the doctrines of the ancient Greek physicians, at an age when the knowledge of the Greek language was very scanty. It was translated into Latin by Gerardus Cremonensis, at Toledo. This translation, revised and accompanied with a commentary, by Jacobus de Partibus, was edited for the first time in 1498, at Lyons, in four large volumes in folio, by two Germans, Johannes Trechsel and Johannes Klein; several other editions have since appeared. An edition of the Arabic text of the Canon was published at Rome, 1593, folio. Avicenna also wrote extensively on philosophy and logic; his largest and most important philosophical work, 'Ash-Shefā,' or the 'Remedy,' has never been printed, either in Arabic or in a translation; but a nearly complete manuscript copy of it is in the Bodleian Library at Oxford.

(Ibn-Khallican, art. Al-Hossein-ben-Sina; Albufaraj, *Historia Dynastiarum*, ed. Pocock, pp. 229-233; Bar-Hebræi, *Chronicon Dynastiarum*, t. i. pp. 231-233; Casiri, *Bibliotheca Arabico-Hispana*, t. i. p. 268, &c.; Hottinger, *Bibliothecarius Quadruparitus*, Tiguri, 1664, 4to, pp. 256-261; Sprengel, *Histoire de la Médecine*, trad. par Jourdan, t. ii. p. 305, &c.; Freind, *History of Physic*; Wüstenfeld, *Geschichte der Arabischen Aertze*.)

Fardella's translation of an account of Avicenna's life by Ibn Joljol Jorjani, Venice, 1595, is cited by Sprengel.

AVIENUS, RUFUS FESTUS, sometimes written ANIANUS, a Latin poet who probably lived in the latter half of the 4th century of the Christian era. To him are ascribed translations of the 'Phænomena' and 'Prognostica' of Aratus into hexameters; a free translation of the 'Periegesis' of Dionysius, entitled, 'Descriptio Orbis Terræ'; and a poem in iambic verse, entitled 'Ora Maritima,' of which only the first book remains, containing a description of the Mediterranean from the Straits of Gibraltar to Marseilles; and three or four short fugitive pieces. The translations from Aratus will be found in many of the editions of that author, and especially in that of Buhle, Lips., 1804. The 'Descriptio' was edited by Friesemann, Amst. 1786; and, together with the 'Ora Maritima,' is contained in the Oxford edition of the 'Minor Greek Geographers.'

AVISON, CHARLES, a musician of considerable eminence both as a critic and a composer, was born about the year 1710. When young he visited Italy for the purpose of study, and after his return to England became a pupil of Geminiani, under whom he acquired his knowledge of score-writing. He settled at Newcastle-upon-Tyne, having accepted in 1736 the place of organist of St. John's church in that town, where he continued till his death. In 1752 he published his 'Essay on Musical Expression,' a well-written work, which displays much acuteness, and no small share of that taste which arises out of good sense and deep reflection. Sir John Hawkins has given a very inaccurate account of this work, and his statement has unfortunately been copied in most biographical collections. His essay was answered by Dr. William Hayes of Oxford, who exposed some errors which Avison had fallen into respecting the established rules of musical composition; but the learned professor made his attack with too much asperity, and his own views were singularly tinctured with pedantry. Avison in the following year replied to Hayes in a short pamphlet written in a strain of bitter sarcasm. Mr. Avison was the projector of the adaptation of Marcello's 'Psalms' to the English version, which Garth of Durham undertook and published, much assisted by the former: the work met however with little success. His own compositions consist chiefly of five sets of 'Concertos for a Full Band,' forty-five in number, which exhibit more elegance than originality, his style being avowedly founded on that of Geminiani: they were nevertheless very favourably received.

AYA'LA, PEDRO LOPEZ DE, the most popular of Spanish chroniclers, was the son of Fernando Perez de Ayala, adelantado of the kingdom of Murcia, and was born in 1332. He was early a favourite of Pedro, or Peter the Cruel, king of Castile, but passed over to the party of Don Henry of Trastamarre, the illegitimate brother of Peter, who revolted against that prince, and drove him from Castile. When Peter returned, accompanied by an English army under the command of Edward the Black Prince, and defeated Don Henry at the battle of Najera, April 3, 1367, Ayala was present on Henry's side. He tells us in his own chronicle that he fought on foot in the vanguard, and bore the banner of the Vanda, a brotherhood of knights, and in the list of the names of the captives he gives his own. He was carried to England, where he was kept in chains in a dark dungeon, the horrors of which he describes in his poems. At length he was released by the payment of a large ransom, and on his return to Castile became one of the

council of Don Henry, who by the assistance of Bertrand Duguesclin and a French army had finally triumphed over his legitimate brother. In the reign of Don John I., the son of Henry, he was no less in favour, and accompanied that king in his expedition to take possession of Portugal, when the Master of Avis, the illegitimate son of King Peter the Severe, laid claim to the crown, and with an inferior force totally defeated the Castilians in the battle of Aljubarota, on the 14th of August, 1385. On this occasion also Lopes de Ayala had the misfortune to be taken prisoner. He served a fourth king of Castile, Henry III., son of John I., in whose reign he died, in the year 1407, at the age of 75, at Calahorra. He held for some time the office of Chancellor Mayor, or High Chancellor.

Fernan Perez de Guzman, who is the original authority for most of the facts relating to the life of Ayala, states that "he was very fond of the sciences, and gave himself much to books and history; so that, although he was a good knight enough and of great discretion in the ways of the world, he passed much of his time in reading and study, not in works of law, but philosophy and history. Through him (por causa del), he adds, "some books are known in Castile that were not so before, such as Titus Livy, which is the most notable history of Rome, the Falls of Princes, the Morals of St. Gregory, Isidore 'De Summo Bono,' Borthius, and the history of Troy. He drew up the history of Castile from Don Peter up to Don Henry III., and he made a good book on hawking, for he was a great hunter, and another book called 'Rhymes of the Palace' (Rimado del Palacio)." This passage in Guzman has proved a fruitful subject of commentary to the investigators of the literary antiquities of Spain.

Ayala's 'History of Castile' is considered the best of the old Spanish chronicles. The most complete edition of it is that entitled 'Cronicas de los Reyes de Castilla, Don Pedro, Don Enrique II., Don Juan I., Don Enrique III., with the emendations of Zurita and the corrections and notes of Don Eugenio de Llaguno Amirolo, 2 vols. 4to., Madrid, 1779, 8vo. There was to be a third volume of Ayala, to contain justificatory documents, an index, a full life of the author, and some of his unpublished minor works, but it has never appeared. The first edition of the 'Chronicles' was published at Seville in 1495, and is so rare that Mendez, the historian of Spanish typography, knew of only two copies, one of which is now in England, in the noble collection bequeathed to the British Museum by Mr. Thomas Grenville. Subsequent editions appeared in 1526, 1542, 1591, &c., but none of them contained the reign of Henry III., which is given in that collated by Zurita. The work of Ayala is written in pure Castilian, with much of the 'gravity' to which the Spaniards attach so high a value. His narrative, if it does not display all the liveliness and vivid colouring of his contemporary Froissart, is on that very account perhaps the more trustworthy. Ayala, as Llaguno Amirolo has shown, certainly does not conceal the faults of his own party. He is fortunate in his subject, which embraces the very period in the middle ages in which the history of Spain was most closely connected with that of France and England. It may therefore justly excite surprise that his valuable history has never been translated into French or English. Of the book on hawking, 'De la Casa de las Aves,' two manuscript copies were known in 1788 to Bayer; one in the hands of Llaguno Amirolo, who probably intended to publish it in the third volume of the 'Chronicles.' The 'Rimado del Palacio' was for a long time believed to be lost. Sanchez, the editor of the 'Coleccion de Poesias Castellanas anteriores al Siglo XV.,' conjectured that an anonymous volume of poetry in the library of the Escorial was the work in question, and the supposition was confirmed shortly after by the discovery of another copy with the author's name. Sanchez intended to include it in his collection, but died before carrying his work so far. Argote y Molina, in his work on the 'Nobleza de Audulucia,' refers to a manuscript work on genealogy ('Libro de Linages') by Lopez de Ayala, which appears to be lost.

(Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge*.)

AYESHAH, the favourite wife of Mohammed, was the daughter of Abu Bekr, one of the earliest and warmest friends of the Mohammedan prophet. She was only nine years old when she married him, and is said to have been the only one of Mohammed's numerous wives who was a virgin, owing to which circumstance her father, whose name was Abdullah, was surnamed Abu-Bekr, or 'the father of the virgin.' Although Mohammed had no children by Ayesbah, he was so tenderly attached to her that he was often heard to say that she would be the first of all his wives to enter Paradise; and in his last illness he had himself carried to her house and expired in her arms. Her enemies accused her of adultery on a particular occasion, and the report gained much credit, until Mohammed, in order to preserve the dignity of his own character and his wife's reputation, produced a seasonable revelation from heaven, attesting Aysbah's innocence, after which he punished the accusers as calumniators. ('Korán,' chap. xxiv., entitled 'the Light'.) After the death of her husband, Ayesbah was held in great veneration by all the Moslems, who surnamed her Umm-ul-múmenin (the mother of the believers), and consulted her on all important occasions. For some reason Aysbah conceived a mortal hatred against the Kalif Othmán, and took an active part in the plot which deprived him of power and life. After the assassination of Othmán she vigorously opposed the accession of Ali, because he had believed at first in the accusation brought against her. Uniting with Talhah,

Zobeyr, and others of Ali's enemies, who had taken up arms under the pretence of avenging the murder of the Kalif Othmán, she put herself at the head of the insurgents, and, after a short contest, gained possession of the city of Basrah. Her troops entered the principal mosque, where the governor, Othmán-Ibn-Honeyf, had taken refuge, took him prisoner and dragged him to her presence. Ayesbah however spared the life of Othmán in consideration of his great age and of his having been the friend of the Prophet, but she gave orders that forty of the principal inhabitants of the place, who were suspected of being the partisans of Ali, should be put to death, which was done. Meanwhile, Ali was advancing upon Basrah at the head of considerable forces, and in the battle which ensued, both Talhah and Zobeyr were slain, and Ayesbah was taken prisoner. [ALI-BEN-ABI-TALEB.] After mutual recriminations between her and Ali, Ayesbah was civilly dismissed by the conqueror, who allowed her to fix her residence at Medina or any other town of Arabia, on condition that she would not meddle in affairs of state. She died at Medina in A.H. 58 (A.D. 677), at the age of sixty-seven.

(*Biographical Dictionary of the Society for the Diffusion of Useful Knowledge*.)

AYLIFFE, JOHN, LL.D., an English jurist, of the circumstances of whose life hardly anything is known. He styles himself Fellow of New College, Oxford, and his works sufficiently attest his industry and learning. In 1714 he published in 2 vols. 8vo. 'The Ancient and Present State of the University of Oxford,' &c.; a work of which a great portion is avowedly an abridgment of Wood's 'Athenæ.' In 1726 he published in folio 'Parergon Juris Canonici Anglicani, or a Supplement to the Canons and Constitutions of the Church of England,' in which he brings much learning and research to bear against the exercise of a separate and independent legislative power by ecclesiastical bodies. In 1732 he published 'The Law of Pledges and Pawns as it was in Use among the Romans;' and in 1734, in a large folio volume, a 'Pandect of the Roman Civil Law, as anciently established in that Empire,' &c. This volume, though it leaves the work incomplete, is one of the most elaborate works on the civil law in the English language. Ayliffe says that he spent thirty years on its preparation. Ayliffe's books give an explanation of those scientific terms of reference to the Corpus Juris which often puzzle casual readers of the foreign civilians.

AYLMER, JOHN, bishop of London, was born at Tilney, in Norfolk, in 1521. He studied some time at Cambridge, but took his degree of divinity at Oxford. He became chaplain to the Duke of Suffolk, who appointed him tutor to his accomplished daughter, the Lady Jane Grey; and her ladyship writes of her instructor in terms of esteem and attachment. In 1553 Aylmer was preferred to the archdeaconry of Stow, in Lincolnshire, which he lost on the accession of Queen Mary. He resided abroad during Mary's reign, pursuing his studies, instructing youth, and corresponding with others of his countrymen in exile.

When Elizabeth came to the throne, Aylmer prepared to return to England, having previously printed a book at Strasbourg, entitled 'An Harborowe for faithful and true subjects, against the late blown blast concerning the government of women.' (4to, 1559). It was of course a reply to John Knox's 'First Blast of the Trumpet against the Monstruous Regiment of Women,' and in it Aylmer with much learning and argument urged the claims of women to the government of a state; and with flattering expressions of loyalty to the queen, he promised "peace and prosperity under a princess of such admirable parts and godly education." Aylmer soon became distinguished as one of the most eminent adherents of the Reformed Church, and was promoted to the archdeaconry of Lincoln, and in 1576 to the see of London. In this office he displayed great intolerance towards both puritans and Catholics; and on more than one occasion his severity was rebuked by the privy council. In the case of a clergyman named Benison, who was imprisoned by Aylmer for a supposed irregularity in regard to his marriage, the bishop was desired by the privy council to make him compensation, lest in an action for false imprisonment, he should recover damages "which would touch his lordship's credit." By the Puritans Aylmer was ridiculed in pamphlets; scandalous reports were actively circulated to his injury; and frequent complaints of his conduct were made to the privy council. Aylmer would gladly have exchanged into a more retired diocese, but none of his plans for this purpose succeeded; and he was still Bishop of London when he died on June 3rd, 1594, in the seventy-third year of his age, leaving a large family of sons and daughters. He was a popular preacher, and a man of considerable learning; but his only publication is the one named above.

(Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge*.)

AYLOFFE, SIR JOSEPH, an eminent English antiquary, described as of Framfield, in Sussex, was descended from an ancient Saxon family formerly seated at Boston Alof, or Boughton Aloph, near Wye, in Kent. He was born about the year 1708, was educated at Westminster School, and was admitted of Lincoln's Inn in 1724. In the same year he was entered a gentleman-commoner of St. John's College, Oxford, which he quitted about 1728. He was elected a fellow of the Royal Society in 1731, and in the following year a fellow of the Society of Antiquaries. In 1751, when the latter Society received its charter of

incorporation, he was one of the first council, and some years afterwards he became vice-president.

Upon the building of Westminster Bridge, in 1736, Ayloffé was appointed secretary to the commissioners; in 1750 he was made auditor-general of the hospitals of Bridewell and Bethlem; and upon the establishment of the new State-Paper Office in 1763, when the papers were removed from the old gate at Whitehall to apartments at the Treasury, he was one of the three commissioners appointed for their preservation; an office which must have assisted him materially in the compilation of a very useful work which he published, in 1772, upon the national records. This work, which forms a large quarto volume, with a very full index, is entitled 'Calendars of the Ancient Charters, and of the Welch and Scottish Rolls now remaining in the Tower of London,' with sundry other documents, embracing treaties of peace between the kings of England and Scotland; catalogues of records brought to Berwick from the Royal Treasury at Edinburgh, and of other Scottish records; transactions of the Scotch parliament from May 15, 1639, to March 8, 1650; and memoranda concerning the affairs of Ireland, extracted from the Tower records. The volume, which is illustrated with four plates containing fac-similes of writing of different periods, has an 'Introduction' of seventy pages, 'giving some account of the state of the Public Records from the Conquest to the present time.' His other writings were chiefly papers for the works of the Society of Antiquaries, some of which were printed separately. About 1748 he prompted Mr. Kirby, of Ipswich, to make drawings of many monuments and buildings in Suffolk, some of which were engraved and published, with a description, while others remained unpublished in the possession of Sir Joseph, who purposed writing a history of the county. About 1764 he drew up proposals for this work, which did not however meet with encouragement, and being disappointed in the supply of materials, Ayloffé abandoned the work. Another work which was announced by him was a translation, with considerable additions, especially of articles illustrative of the antiquities, history, laws, customs, manufactures, commerce, and curiosities, of Great Britain and Ireland, of the 'Encyclopédie' then publishing at Paris, under the direction of Diderot and D'Alembert. But the project was not well received by the public, and the undertaking was dropped. Towards the close of his life Ayloffé wrote descriptions of some monuments in Westminster Abbey, of which engravings were made for the Society of Antiquaries; but he died before three sheets of the work had passed through the press; it was however continued by Gough, and forms his well-known 'Sepulchral Monuments.' Nichols states that besides the above-mentioned publications, Ayloffé superintended or revised for the press Thorpe's 'Registrum Roffense,' published in folio, in 1769; a new edition of Leland's 'Collectanea,' in 6 vols. 8vo, 1770; and new editions published in the following year, of Hearne's 'Curious Discourses,' in 2 vols. 8vo, and of the 'Liber Niger Scaccarii,' 2 vols. 8vo, to the latter of which he added the charters of Kingston-on-Thames, of which place his father was recorder. He died at his residence in Kennington Lane, Lambeth, on the 19th of April, 1781, in his seventy-second year, and was buried, with his father and his only son, at Hendon.

(Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge.*)

AYMAR, JAQUES, a peasant of Dauphiné, who attracted the attention of all France, towards the close of the 17th century, by his pretended powers of divination, was born at St. Veran, on the 8th of September, 1662. He was bred to the business of a mason, but appears to have soon forsaken it for the more profitable trade of wielding the divining-rod. At first he confined his pretensions within the usual limits, giving his assistance in the discovery of springs, mines, hidden treasures, and obliterated boundaries; but in course of time he professed to have found a new and most important use of the magic rod. By its help he not only pointed out where stolen property was hidden, but followed the traces of the thieves until they were lodged in the hands of the officers of justice. In 1688 and 1689 he is recorded to have performed several feats of this nature in and around Grenoble, but it was not until 1692 that his reputation rose to its height. On the 5th of July in that year, at Lyon, a vintner and his wife were murdered, and their shop robbed, under such circumstances that the endeavours of the authorities to discover the perpetrators were fruitless. At length Aymar was employed to trace the fugitives, of whom not even the number was known. Provided with his rod, he proceeded down the Rhône, pointing out to the officers every spot at which the murderers, whom he pronounced to be three in number, had rested, and the very vessels out of which they had drunk. Arrived at length at the Camp of Sablon, he declared that the murderers were present; but, under pretence of the fear of ill-treatment from the soldiers, should he then attempt to trace them more closely, he went back to Lyon. Returning with a better attendance, he proceeded further down the river, and at length stopped before the jail at Beaucaire, which he declared to contain one of the objects of pursuit; and the rod finally selected a hunchbacked young man just confined for a petty theft as the criminal. He was taken on the charge of murder, and, although he at first asserted his innocence, he soon confessed that he had planned the robbery, and watched the door of the vintner's shop while the murders were committed by his accomplices, two natives of Provence. Aymar was then despatched in pursuit of the

latter, but it was found, by the assistance of the rod, that they had taken ship. They were still pursued by sea until within sight of Genoa, when it was evident the murderers had escaped out of the French territory, and the officers were compelled to put back. Shortly after their return, the hunchback was condemned to be broken alive on the wheel; a sentence which was carried into effect on the 30th of August, 1692.

The sensation produced by these events throughout France, and especially in the learned world, was similar in its nature to that produced by 'table-turning' and other 'spiritual' proceedings in our own day. The facts were admitted, and numerous theories were put forth to explain the marvel. One section of theorists, almost exactly as with recent 'spiritual manifestations,' rejected all attempts at a physical solution of the difficulty, and at once attributed Aymar's performances to the direct agency of Satan. The Abbé Le Brun produced an elaborate treatise on the subject, entitled 'Illusions des Philosophes sur la Baguette.' An immense number of pamphlets on both sides of the question flowed from the press in 1692 and 1693.

In the meantime Aymar was sent for to Paris, at the instance of the Prince de Condé, who wished to see with his own eyes the wonders of his art. The removal was fatal to his pretensions, for the rod now failed in every trial. It indicated springs where nothing was found, on digging, but dry earth; pointed out treasures in spots where stones and rubbish only were deposited; and finally led the prince into great trouble and expense in re-discovering treasures which had been hidden in the garden with the view of testing Aymar's powers, and which his rod had passed over unmoved. At length, all his arts failing him, Aymar acknowledged himself an impostor, and fell back into his original obscurity.

The affair of the hunchback executed at Lyon was never further elucidated. It is not impossible that he was the innocent victim of a prevailing excitement, in which he himself may have partaken. If guilty, the probability is that Aymar knew of his participation in the crime beforehand, and made use of the knowledge as a ready means to gain credence in the powers of his art. Many of the treatises published on the occasion of Aymar's performances with the rod betray a degree of credulity which a very few years ago would have seemed almost incredible.

(Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge.*)

AYMON, or HAIMON, Count of Ardennes, and his four sons, 'les quatre fils Aymon,' named Alard, or Adalhard, Regnaud, Guichard, and Richardet, are conspicuous among that class of half-historical half-fictional personages whose adventures form the subject of the romances of chivalry which relate to Charlemagne's period, such as the French romantic tales by Adenes, Huon de Villeneuve, and others, and the more elaborate Italian romantic poems of Pulci, Bello, Tasso (in his poem 'Rinaldo'), and above all the splendid epées of Bojardo and Ariosto, in which the sons of Aymon, and especially the most illustrious of them, Regnault (Rinaldo in Italian), act a prominent part.

The existence of Aymon, count of Ardennes, is mentioned by Arnold Wion, a Benedictine historian and biographer, in his 'Lignum Vitæ,' or 'History of the Order of St. Benedict,' part ii., and by several other historians. Cantimpre, or Thomas Cantipratanus, a Dominican monk and miscellaneous writer of the middle of the 13th century, in his work 'Miraculorum et Exemplorum Memorabilium sui Temporis libri Duo,' edited by J. Colvenerius in 1605, asks, under the head of 'the Folly of Tournaments,' those who piqued themselves on their feats of horsemanship and jousting, "Whether they could ever expect to rival the reputation of the famous horse Bayard, who lived in the time of Charles, and had been dead more than five centuries, but whose memory lived still?" To this the editor Colvenerius adds this note in the Appendix: "This horse Bayardus is commonly said to have belonged to the four sons of Haimon, in the time of Charlemagne, and is called in Belgian 'Rosbeyaert;' or in French 'rouge Bayard.' Fabulous tales of this horse are repeated to the present day both in French and in German." Traditions about Bayard and the quatre fils Aymon are still preserved in Belgium. Several towns, and Mons among the rest, have streets named 'des quatre fils Aymon.' In the county of Namur there is a cliff, called the 'Roche à Bayard,' from which the horse, it is said, leaped into the Mass. In the novel 'Les quatre fils Aymon,' however, the story is that Charlemagne passing through Liège after Regnault had set out for the Holy Land, ordered Bayard to be thrown from the bridge into the Mass, with a millstone round his neck; but Bayard stemmed the current, leaped on shore, and "is said to be still alive in the forest of Ardennes." Bayard, or Ros-Beyaert in Flemish, figured, and still figures, in some popular processions at Louvain, Mechlin, and other parts of Belgium.

The novel 'Les Quatre fils Aymon' was written by Huon de Villeneuve, a French poet, who lived under Philippe Auguste, and wrote several chivalric romances concerning Charlemagne and his Paladins. These romances were afterwards turned into prose, and we have numerous editions of the prose version of the 'Quatre fils Aymon.' There is an English translation of the prose version: 'The right Pleasant and Goodly Historie of the Four Sounes of Aimon,' imprinted at London by Wynkyn de Worde, 1504.

The name Rainaldus, or Reginaldus, appears frequently in the early

chronicles of the Carolingian dynasty. A Count Rainaldus of Aquitania, count of Nantes, is mentioned in Duchesne's 'Historia Francorum Scriptores,' as having fought under Charles the Bald against the Bretons, and being killed in battle, A.D. 843. Near Anconia, not far from Nantes, is a place called Clairmont, which is the name ascribed to the family of the Regnault of romance. Eginhardt, in his 'Annales Ludovici Pi,' mentions a Reginaldus, chamberlain to Louis the Pious, who joined in a conspiracy against his sovereign, for which he had his eyes seared out. In the Spanish ballad entitled 'Don Reynaldos,' he appears as banished from the court of Charlemagne, of whose injustice he bitterly complains. He then resolves to accompany his cousin Roland to fight against the Moors, and they both perform prodigies of valour. A Rainaldus is mentioned by the historian Ordericus Vitalis, under the year 876, and is called, hyperbolically no doubt, chief, or general, of all France, 'totius Francie Dux.' Dudo of St. Quentin, in Duchesne's collection, speaks of a Reginoldus, contemporary with the Rainaldus of Ordericus, as a celebrated warrior who died in battle against the Normans, who had invaded France in the reign of Charles the Bald, and says that his standard-bearer Rotlandus fell with him. Ordericus says that both Rainaldus and Rotlandus were killed by the Normans of Rollo, the finishing blow to Rainaldus being given by a fisherman of the Seine, who pierced him with a spear; and several other Rainaldi are mentioned. All these Rainaldi were probably confounded in one personage by subsequent romance writers, who gathered their materials from old ballads and traditional legends. In the same manner the weak and credulous character attributed in most romances to Charlemagne belongs more properly to his successors Louis and Charles the Bald, and the wars of Charles Martel against the Saracens who had invaded France have been ascribed, through a like anachronism, to the reign of Charlemagne.

In the romance 'Les quatre fils Aymon,' by Huon de Villeneuve, already mentioned, Aymon, count of Dordone, is represented as having four valiant sons, Alard, Regnault, Guichard, and Richardet. The sons had a cousin named Maugis (the Malagigi of Italian romance), who equalled them in valour, and who was moreover a sorcerer or enchanter. Beuve d'Aygrement, father of Maugis, had killed one of the sons of Charlemagne, but had sued and obtained pardon. Some time after Guennes (the Gano of the Italian poems), a relative of the emperor, and a man of consummate wickedness, treacherously slew Beuve with the connivance of Charlemagne. It happened, after this, that Regnault was playing at chess with Bertholet, the emperor's nephew, when the latter insulted and struck him. Regnault, who had not forgotten the murder of his uncle, seized the chess-board, which was of solid gold, and struck Bertholet with it, and with such violence that he clove his head in two. In consequence of this, the four brothers, as well as Maugis, were outlawed, and Aymon himself was ordered by the emperor to march against his own sons. They obtained possession of a castle called Montensor, in which they defended themselves for seven years, and defeated their father's vassals. Being obliged at last to evacuate the castle, they were attacked in their retreat by the emperor in person, when Regnault slew one of the emperor's squires, and nearly killed the emperor himself. The brothers then took shelter in a forest, where they lived as banditti. They afterwards found protection from Yon, king of Bordeaux, who gave his sister Clarice in marriage to Regnault, whom he allowed to build a strong castle in his dominions, which was called Montauban (the Montalbano of Italian romance). Yon however, being hard pressed by Charlemagne, consented to betray the Fils Aymon. Richardet was seized, and would have been hanged had it not been for the timely assistance of Regnault. Maugis escaped by the help of his sorcery, after which he turned hermit, and Regnault went to the Holy Land, where he performed many exploits against the Saracens. On his return home he made peace with the emperor. He then killed Foulques of Morillon, a traitor of the Maganza family, after which a combat took place, in which Regnault's sons Ivon and Aymonet killed the two sons of Foulques. Regnault then, being tired of the world, repaired to Cologne to assist in the building of the cathedral of that town, as a common workman, in expiation of his sins, and there he was killed by his brother workmen, who were jealous of his superior skill and address. His body afterwards performed miracles, and he was canonised as a saint.

Such is the substance of this story, which, with many alterations and additions, has been made the groundwork of subsequent romances, through which the name of Regnault or Rinaldo has acquired a sort of historical fame.

(Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge.*)

AYTON, or AYTOUN, SIR ROBERT, was born of a good family at Kinaldie in Fifeshire, in 1570. He was a younger son, and was incorporated a student at St. Leonard's College, in the university of St. Andrew's, with his elder brother, in 1584. He took the degree of Master of Arts at St. Andrew's in 1588, and afterwards studied in France. In 1603 he addressed an encomiastic Latin poem in hexameters to King James I., on his accession to the throne of England. Ayton seems to have been an accomplished courtier, and he reaped the reward of his adulation in being appointed to the offices of private secretary to the queen, gentleman of the bed-chamber, and master of requests. He was employed by King James to convey copies of one

of his works to the emperor and the various princes in Germany. He became the proprietor of a small mountainous estate called Over Durlie, in Perthshire; but he probably continued to reside at court. Aubrey says of him, that "he was acquainted with all the wits of his time in England," and that "he was a great acquaintance of Mr. Thomas Hobbes, of Malmesbury, who told me he made use of him (together with Ben Jonson) for an Aristarchus, when he drew up his epistle dedicatory for his translation of Thucydides;" and Jonson, in his conversation with Drummond of Hawthornden, remarks that "Sir Robert Ayton loved him dearly." In his Latin poems there are some epitaphs and epigrams in which the names of other distinguished men of the day, who appear to have been his friends, are commemorated. He died in the palace of Whitehall, in March, 1638. The vernacular poems of Ayton, for which alone his personal history is now an object of any curiosity, appear to have never been considered by him worthy of preservation, though many of his Latin poems were twice published during his lifetime. With a trifling exception, such of his English poems as have reached us have come down almost traditionally, and have not retained their original orthography. During the last century some pieces of poetry which found their way into poetical selections were attributed on imperfect testimony to Sir Robert Ayton; a collection of these was printed in the miscellany of the Bannatyne Club. Some years ago a student of St. Andrew's purchased at a sale of books a manuscript, which bore the title of 'The Poems of that worthy gentleman Sir Robert Ayton, Knight, Secretary to Anna and Mary, Queens of Great Britain,' &c.; but this version is also of comparatively late date, and in modern orthography. It contains some pieces which are not in the Bannatyne collection, and has been very creditably edited by the discoverer. Burns was a great admirer of some of the poems attributed to Ayton; and one of them is the original of his 'Auld Lang Syne.' A monument to Ayton's memory, with an inscription detailing some of the events of his life, stands in the south side of the choir of Westminster Abbey, at the corner of Henry V.'s chapel. (Abridged from the *Biographical Dictionary of the Society for the Diffusion of Useful Knowledge.*)

AZARA, DON FELIX DE, was born at Barbuñales, near Balbastro, in Aragon, on May 18, 1746. He received his early education at Huesca, and afterwards studied at the military academy of Barcelona. In 1764 he entered the army, and served as a lieutenant in the expedition against Algiers under O'Reilly, in which he was wounded. In 1780 he was sent, with the rank of lieutenant-colonel, as one of the commissioners appointed by Spain to define the limits of its possessions in Paraguay, which had been long a matter of dispute between Spain and Portugal. While there, he undertook the task of making a map of Paraguay, a labour which occupied him for thirteen years. He had to explore vast and wild unknown regions, inhabited by Indian tribes, often hostile, and in the midst of dangers and privations of every kind. He was also exposed to annoyance and persecution from the jealousy and ignorance of the Spanish authorities. Azara's character however withstood these severe trials, and he rendered some essential services to his government, especially in reconnoitring the coast south of the Rio de la Plata, in the country of the Patagonians. He was recalled to Europe in 1801. He then went to Paris, where his elder brother, Nicolas de Azara, was ambassador for Spain; and he remained there until his brother's death in January 1803. Afterwards, Charles IV., king of Spain, called him to Madrid, and appointed him a member of the council for Indian affairs. He died at Aragon in 1811.

Azara's travels in South America were published in French at Madrid in 5 vols., 8vo, 1802. A French version was published at Paris in 1809; it was edited by C. A. Walckenaer, to whom the author had intrusted the revision of the work, with notes by G. Cuvier, an atlas, and a life of Azara, 4 vols. 8vo. They contain a description of Paraguay, and of the various Indian tribes scattered through that vast region, their habits and characteristic varieties; with an account of the Spanish discovery and conquest, and of the establishment of the missionary colonies by the Jesuits, and of their singular system of government. The second part of the work consists of a valuable history of the quadrupeds and reptiles of that country, which had been previously published separately in 2 vols. 8vo, Paris, 1801; it was translated into French from the manuscripts of the author, by Moreau St. Mery. An English translation of the first volume of the Spanish edition of Azara's 'Natural History,' by Mr. P. Hunter, was published at Edinburgh in 1836 under the title of 'The Natural History of the Quadrupeds of Paraguay and the River La Plata.'

AZARA, DON JOSÉ NICOLAS DE, was born at Barbuñales in 1731. He studied at Salamanca, where he attracted the attention of Don Ricardo Val, minister of King Ferdinand VI., who gave him a place in the department of foreign affairs. In 1760 he was sent to Rome, as agent for the ecclesiastical affairs of Spain. Don José Monino, known afterwards as the Count of Florida Blanca, who was then Spanish ambassador at the court of Rome, being soon after appointed prime minister of Charles III., was succeeded in the embassy by the Duke Grimaldi, but Azara performed all the real diplomatic business with the papal court. He took an active part in the difficult negotiations concerning the expulsion of the Jesuits from Spain. After Grimaldi's death, Azara was appointed his successor. He enjoyed the full confidence of Pope Pius VI., and had much influence on the Roman politics of

that time. Azara was fond of literature and of the arts, and was intimately connected with all the distinguished men who were then in the Roman capital, such as cardinals De Bernis, Albani, and Borgia; the archaeologists Winckelmann, Fea, Marini, and Visconti; the artists Canova, Angelica Kaufmann, Mengs, Volpato, &c.; and the learned Jesuits Artega, Andres, Clavigero, and Ortiz. He was especially the friend and patron of Mengs. After the death of that artist, he provided for his family; and he wrote a life of the deceased, which he prefixed to a splendid edition of his works, made at his expense by the printer Bodoni. Azara made a valuable collection of antiquities, and he was successful in several excavations near Rome. In 1796, when Bonaparte threatened Rome, Azara repaired to his headquarters, and succeeded in preventing the advance of the French, though at the price of exorbitant contributions imposed on the Roman state by the conqueror. Azara's influence at the papal court declined after this transaction, he being regarded as having submitted to terms beyond what the necessity of the case justified. When the French took possession of Rome in 1798, Azara withdrew to Florence. In 1801 he was appointed ambassador for Spain at Paris. He lost his situation through the intrigues of Godoy, the favourite of King Charles IV., and died in 1803, as he was preparing to set off for Italy to resume his favourite studies. Besides the life of Mengs, he translated Middleton's 'Life of Cicero,' and several other works into Spanish.

AZUNI, DOMENICO ALBERTO, was born at Sassari, in the island of Sardinia, on August 3, 1749. He applied early to the study of the law, and paid particular attention to the maritime regulations, which have often been matter of dispute between nations. Azuni becoming known as a distinguished jurist, was made a senator and judge of the tribunal of commerce of Nizza, in the continental states of the King of Sardinia. In 1795, after the French had taken possession of Nizza, Azuni published his 'Sistema universale dei Principii del Diretto Marittimo dell' Europa,' in which he endeavoured to

reduce the maritime laws to fixed principles. He afterwards recast his work, and published it in French at Paris, with the title of 'Droit Maritime de l'Europe,' 2 vols. 8vo, 1805. This work on account of its attack on what is called the assumption of superiority by the British navy over the flags of other countries, its disregard of equal rights on the seas, and especially of the rights of neutrals, as well as of its defence of privateering, recommended Azuni to Napoleon's ministry, who appointed him one of the commissioners for the compilation of the new commercial code, and intrusted him with the part relative to maritime affairs. In 1807 Azuni was appointed president of the Court of Appeal at Genoa, which city and territory had been annexed to France. He was afterwards elected member for the same to the legislative corps sitting at Paris. He there published an 'Essai sur l'Histoire Géographique, Politique, et Morale de la Sardaigne,' 2 vols. 8vo, accompanied by a map of that island, the draught of which was taken from the archives of Turin. The second volume is entirely occupied by the natural history of Sardinia. In 1809 Azuni wrote a pamphlet, in which he ascribed to the French the invention of the mariner's compass. This engaged him in a warm dispute with those who maintained the prior right of the Italians to the discovery, and especially with the orientalist Hager, professor in the University of Pavia, who refuted Azuni's book. Azuni next published a 'Dictionary of Mercantile Jurisprudence,' of which a new edition was published at Leghorn in 1822. He continued his functions in the tribunal of Genoa until the fall of Napoleon, when he withdrew first to Nizza, and afterwards to his native island of Sardinia, where the late King Charles Felix appointed him judge of the consulate of Cagliari, and librarian to the University of the same city. He died at Cagliari in January 1827. Besides the works named above, Azuni wrote 'Mémoires pour servir à l'Histoire Maritime des Marins Navigateurs de Marseille,' and some others. (*Biografia degli Italiani Viventi.*)

B

*BABBAGE, CHARLES, entered at Trinity College, Cambridge, where he took his degrees, that of B.A. in 1814. In the following year he communicated a paper—"An Essay towards the Calculus of Functions," to the Philosophical Transactions, and in 1816 was elected a Fellow of the Royal Society, and afterwards, in 1822 and 1826, was chosen on the council.

In 1822 Mr. Babbage published a letter addressed to Sir H. Davy on the 'Application of Machinery to Calculating and Printing Mathematical Tables;' an important question in mechanical science. The government, on the recommendation of the council of the Royal Society in 1823, sanctioned grants for the construction of the calculating machine, as proposed by the inventor, whose name has so long been associated with the remarkable mechanism. A description of it will be found under the head of CALCULATING MACHINES in the DIVISION OF ARTS AND SCIENCES.

Mr. Babbage was one of the founders of the Royal Astronomical Society and of the British Association, and the originator of the Statistical Society. In 1828 he was appointed Lucasian Professor in the University of Cambridge, which post he resigned in 1839. Besides the societies above-mentioned, he is a Fellow of the Royal Society of Edinburgh, of the Royal Irish Academy, the Cambridge Philosophical Society, and the chief scientific societies of Europe and America.

Mr. Babbage's writings exhibit a wide range of learning and research. Numerous valuable papers on mathematical subjects, on magnetic and electrical phenomena, 'On a Method of Expressing by Signs the Action of Machinery,' appear in the 'Philosophical Transactions' from 1815 to 1826. The 'Journal' of the Royal Institution, the 'Transactions' of the Astronomical Society, of the Royal Society of Edinburgh, and of the Cambridge Philosophical Society, also contain papers from his pen. He wrote the articles 'Diving Bell,' and 'Essay on the General Principles which Regulate the Application of Machinery,' for the 'Encyclopædia Metropolitana.' His 'Reflections on the Decline of Science in England,' appeared in 1830; the 'Economy of Manufactures and Machinery' in 1832. This work is now in its fourth edition; it was translated by order of the governments of Spain and Prussia; two translations of it have appeared in French, and others in Italian and Russian, as well as numerous reprints in the United States. 'The Ninth Bridgewater Treatise' was published in 1837, it has gone through two editions; and was followed in 1851 by 'The Exposition of 1851; or, Views of the Industry, the Science, and the Government of England,' which has also passed through two editions. Mr. Babbage has moreover written on geological subjects. His 'Observations on the Temple of Serapis, at Pozzuoli, near Naples; with an attempt to explain the causes of the frequent elevation and depression of large portions of the earth's surface in remote periods, and to prove that those causes continue in action at the present time,' appeared in the 'Proceedings of the Geological Society' in 1846; and 'On some Impressions in Sandstone,' in 1847.

BABER, or BABUR, with his complete name ZAHIR-EDDIN-MOHAMMED-BABER, the celebrated founder of the Tatar, or, as it is

often improperly called, the Mogul empire in Hindustan, was born on the sixth of Moharrem, A.H. 888 (14th February 1483). His father, Sultan Omar-Sheikh-Mirza, a great-great-grandson of the celebrated Timur, or Tamerlane, was sovereign of Ferghana, a considerable province situated on both sides of the river Sirr, the Jaxartes of the ancients. Though only in his twelfth year when his father died, he secured the possession of the greater part of his father's dominions in spite of the opposition of his uncles, the sultans of Samarcand and Bokhara; and of other hostile neighbours. The history of Baber's reign till the twenty-third year of his age is a continuous succession of vicissitudes, in which we find him alternately conquering and losing Samarcand, Andijan, Khojend, and other places in or near his paternal dominions. In the year 1503, Sheibani-Khan, a descendant of Gengiz-Khan, by his eldest son, Tushi, or Jajikhan, the sovereign of Kipchak, conquered not only Samarcand and Bokhara, but also the countries of Ferghana and Uratippa; and Baber, after wandering for nearly a year as a fugitive among the mountains that separate Ferghana from Hissar and Karatigin, quitted his native country and resolved to try his fortune in Khorasan (1504), which was at that time held by Sultan Hussain Mirza, a powerful and distinguished prince of the family of Timur. With less than 300 followers, and only two tents, Baber crossed the river Amu, or Oxus, a little above Termez. He did not receive from Sultan Hussain-Mirza the support which he had anticipated; but a number of Moguls in the service of Khosru-Shah, who occupied Badakhshan, quitted the service of that chief, and, by declaring for Baber, forced Khosru-Shah himself to submit to him. Thus strengthened, Baber marched towards Cabul, which was surrendered to him after a short siege (October, 1504). He allowed the Afghan governor and the garrison to depart in safety, and divided the country of Cabul among those chiefs who had lately entered his service.

In the ensuing year (1505) Baber made an irruption into Hindustan, advancing along the western bank of the Indus, as far as the tomb of Pir-Kanu (probably near Dera-Ghazi-Khan, in 29° 50' N. lat.), returning by Ghuznee to Cabul. In 1506 Sultan Hussain-Mirza died, and Baber repaired to Khorasan, where he found occupation in repelling an incursion of the Uzbeks. He also drove them out of Cabul, and subsequently captured Candabar from the hands of two Afghan noblemen. In September, 1507, Baber again set out to invade Hindustan, but was stopped by the opposition of a predatory Afghan tribe. We know little of Baber's movements till 1519, except that on the death of Sheibani-Khan, in 1510, he succeeded in recovering part of his former territory, which was however retaken from him by the Uzbeks, under Timur Sultan, the son of Sheibani-Khan.

In 1519 Baber undertook another expedition with a view to conquer Hindustan. He now for the first time crossed the Indus, probably a little above Attok (February 17, 1519), but soon re-crossed it, having taken a few places, and appointed governors in them. The next invasion, in 1524, in which he conquered and burnt Lahore, brought him beyond the Sutlej, as far as Sirhind, and gave him a permanent

footing in the Punjab. But the overthrow of the Afghan dominion in Hindustan was decided by the expedition which Baber undertook in 1525. On the 16th of December of that year he passed over the Indus; then marching along the skirts of the Himalaya, and crossing the rivers Behut, Chenab, Ravee, and Beyah, he took the Afghan fort of Milwat (January 5, 1526), where he left a governor and garrison. Upon reaching Dûn, Baber resolved to march at once against Sultan Ibrahim Lodi, the Afghan sovereign, in whose possession the throne of Delhi and the dominions of Hindustan at that time were. Advancing by the towns of Sirhind, Ambâla, and Shâhâbâd, he crossed the Jumna by a ford near Sirsaweh, and reached Panipat (April 12), a town about 50 miles N.W. from Delhi. Here Sultan Ibrahim, with his army, encountered him on the 21st of April, but was completely defeated and killed in the battle. This victory decided the conquest of Hindustan; for, although there were many little principalities in the hills, yet the Afghan government, which extended from the Indus to Behar, was the only one of importance. Baber immediately dispatched detachments to occupy the two principal cities, Delhi and Agra; the latter town he himself entered on the 10th of May, and took up his residence in Sultan Ibrahim's palace, while his son Humâidn marched eastward against two Afghan chiefs who had assembled an army of 40,000 or 50,000 men. They were defeated and dispersed. Other important conquests were made; and in February 1527 Baber won a decisive victory at Biana, near Agra, over Rana-Sanka, the most powerful of the native Hindoo princes, in consequence of which he assumed the epithet of 'Ghâzi,' that is, 'the victorious in war against infidels.' The conquests of Baber, from the Indus to the mouths of the Ganges, were made so rapidly, and they comprehended so wide an extent of countries and so great a variety of population, that to cement them into a firm union would have required many more years than Baber lived. His son Humâidn had difficulty in maintaining possession of these extensive territories; and it was not till the reign of Baber's grandson, Akbar, that a regular administration of the whole empire was established.

Towards the conclusion of his reign, Baber endeavoured to promote the prosperity of his empire. He made or improved public roads, with resting-places for travellers at suitable distances; he caused the land to be measured, in order to have a scale whereby to fix the taxation; he planted gardens, and introduced fruit-trees from abroad into the several provinces of Hindustan; and he ordered a regular line of post-houses to be built from Agra to Cabul.

Baber died at the Charbagh, near Agra, on the 26th of December, 1530, and was succeeded by his son Humâidn on the throne of the empire. Baber was undoubtedly one of the most distinguished sovereigns that ever sat upon an Asiatic throne. In no common degree he possessed benevolence, good-nature, and frank gaiety; and with these qualities he united the leading characteristics of a statesman and a military commander. Of his literary accomplishments and general information, the autobiographic memoir written by himself in his native language, the 'Jaghatai Turki,' gives us a favourable idea: there is perhaps no other work of this kind in existence which affords a more accurate notion, not only of the life, character, and way of thinking of its author, but of the whole aspect of his age, and of the persons and objects surrounding him.

(*Memoirs of Zehir-ed-din Muhammed Baber*, translated by John Leyden and William Erskine, London, 1826, 4to.)

BABEUF, FRANÇOIS NOEL, is chiefly known in the history of the French Revolution as the originator of the Babeuf conspiracy. He was born at St. Quentin, in the department of Aisne, in 1764. He was apprenticed to an architect and surveyor in the town of Roye, in the department of the Somme, but was soon drawn from that pursuit by the commencement of the revolution, of which he began to advocate the principles in a journal entitled the 'Correspondent Picard,' published at Amiens. The violence he displayed in this journal caused him to be prosecuted at Paris in 1790, but he was acquitted. He was subsequently appointed administrator of the department of the Somme, and shortly afterwards removed, with the same title, to Montdidier. Being accused of forgery, he fled to Paris, was there arrested, and sent before the tribunal of Aisne, where he was again acquitted. He returned to Paris, and commenced in July, 1794, a journal called 'The Tribune of the People,' taking for its motto a maxim of Rousseau—"the object of society is the general good;" and signing the articles *Caius Gracchus*, a name by which he was afterwards generally known; and in this journal he developed the principles of an universal equality. In 1796, he and his adherents, then become somewhat numerous, instituted a secret committee, consisting of twelve, who were styled chiefs of *arrondissements*. They placed themselves in connection with the representatives of sections, who were wholly unknown to each other, and also gained the adhesion of some regiments in garrison at Paris and the environs. They counted also on the support of the departments, where they had organised an insurrectionary army. The proposed plan was to attack simultaneously the Directory, the legislative body, and the chiefs of the staff. Their plans were carefully prepared; but one of the conspirators named Griesel betrayed the plot to Barras at the moment when these plans were to be carried into execution. Barras caused Babeuf and sixty-five of his fellow-conspirators to be seized. They were tried before the high court of Vendôme on May 26, 1797. Babeuf and another named Durthé were found

guilty, and sentenced to death, seven others were condemned to transportation, and fifty-six were ultimately acquitted. Babeuf and Durthé stabbed themselves at the moment of pronouncing the decree, on May 27th, but were notwithstanding borne, bleeding and expiring, to the scaffold.

Babeuf, going before the agitators of the present day, seems to have wished to give the revolution that tendency which we call Socialism. In all his writings he maintained a social equality, a community of goods, no want, no riches. This idle theory can never become a practical condition of mankind; for whatever interferes with the intellectual liberty of the individual, restricting his choice of occupation and restraining his desire for the acquisition of property, must inevitably fail, being opposed to the elements of the human character.

BABINGTON, WILLIAM, a distinguished physician, was born in June 1756 at Portgleneone, a village on the Ban, near Coleraine, in the north of Ireland. After acquiring the usual elements of general education, he was apprenticed to a medical practitioner at Londonderry, and on completing his apprenticeship he proceeded to London to pursue his medical education. Being provided with an introduction to Mr. Frank, surgeon to Guy's Hospital, he became his dresser at that institution. Thence he went to Haalar Hospital, and afterwards for a short time to Winchester Hospital. A vacancy having taken place in the office of apothecary at Guy's Hospital, Babington, although young, received the appointment; and soon afterwards he was selected to assist Dr. Saunders at the hospital in his lectures on chemistry. While still there, by the advice of some friends, he purchased the valuable collection of minerals which had belonged to the Earl of Bute—perhaps the finest which at that time existed in England. On obtaining possession of his purchase he proceeded to class the minerals and to catalogue them. He also divided the cabinet into several portions, which he disposed of at different times. His attention was thus drawn to the subject of mineralogy, and he studied the subject so well, as to be able to publish, in 1795, a work entitled 'A Systematic Arrangement of Minerals, founded on the joint consideration of their Chemical, Physical, and External Characters.' The arrangement was presented in the form of tables.

In 1797 he resigned his office at Guy's Hospital, and having obtained the degree of Doctor of Medicine, he commenced private practice as a physician in Freeman's-court, Cornhill, in the city of London. Soon after he was elected one of the physicians to Guy's Hospital, where he had continued to lecture on chemistry, in which duty he was joined by Mr. William Allen. In 1799 he published his 'New System of Mineralogy,' which may be considered a continuation of the former work. In 1802 he published a 'Syllabus of the Course of Chemical Lectures.' In 1796 he became a Fellow of the Medical Society of London, and exerted himself zealously to promote the advancement of the science of medicine. He removed to Basinghall-street, where he became the neighbour and friend of Dr. Lettson, the chief promoter of the Medical Society. As his practice soon greatly increased, he removed to a large house in Aldermanbury. To this house, in 1807, "with a view to enable Count Bourmon, of whom he had been a pupil, to publish his elaborate monograph on the carbonate of lime, Dr. Babington invited a number of gentlemen the most distinguished for their zeal in the prosecution of mineralogical knowledge. A subscription was opened, and the necessary sum readily collected. This object having been accomplished, other meetings of the same gentlemen took place, for the joint purpose of friendly intercourse and mutual instruction. From such small beginnings sprang the Geological Society, and among the names of those by whose care and watchfulness it was supported during the early period of its history, that of Dr. Babington must always stand conspicuous." (Mr. Greenough's 'Address to the Geological Society,' 1834.) In 1822 he was elected president of the society, having been vice-president in 1810 and the three subsequent years. He enriched the museum and library with liberal donations, and the 'Transactions' of the society contain several papers by him.

A fine trait in Dr. Babington's character was his readiness to learn from others, although himself so well qualified to be an instructor. In this spirit he became a pupil of Mr. Webster, after he had quitted the office of president of the Geological Society, and he attended the course of chemical lectures at the London University in the year 1832. In addition to the discharge of his duties as a physician, he continued his studies in practical chemistry, especially pharmacy, geology, and vegetable physiology. In order to promote the advancement of medical science, Dr. Babington assisted in instituting in the immediate neighbourhood of his residence a society called the Hunterian, for the purpose of friendly meetings and the discussion of medical topics. He also became a member of the Medico-Chirurgical Society, and the first volume of their 'Transactions' contains a paper by him, 'A Case of Exposure to the Vapour of Burning Charcoal,' 1809. While his mornings were devoted to the practice of his profession, his evenings were dedicated to study, or social intercourse with individuals distinguished by their attainments or love of science. He was the personal friend of nearly all the most eminent scientific men of his day, and he was justly esteemed by the public as an able and enlightened physician.

The Royal Society admitted Dr. Babington as one of its fellows, and the Royal College of Physicians testified their sense of his character by

electing him from among the ranks of the licentiates into the number of the fellows. In 1831 he removed from Aldermanbury to Devonshire-street, Portland-place, continuing however to visit as their physician a few of his attached friends and patients. During the prevalence of the fatal influenza in the spring of 1833 he zealously attended his patients, till at last, from exposure to the evening air after being present at a crowded scientific meeting, he was himself attacked by that disease, and on the 29th of May expired at his house in Devonshire-street, in the seventy-seventh year of his age. The general expression of regret which followed the announcement of Dr. Babington's death proved the estimation in which he was held for his personal character as well as for his professional attainments. As a scientific man, although he attained no very distinguished rank, yet he without ostentation greatly contributed during nearly half a century to the promotion of many branches of physical as well as medical science, and gave an impulse to the study of mineralogy and geology, the beneficial effects of which will long be felt.

(*Memoir of the Life and Writings of William Babington, M.D., &c., by his son-in-law, Richard Bright, M.D.*)

BA'BRIUS was the writer of a collection of Æsopian fables, which he turned from prose into choliambics. The time at which he lived is not known, but from the mention of him by Avianus in the preface to his fables, and as some of the verses of Babrius are quoted by Apollonius in his 'Homeric Lexicon,' it is most probable that he lived somewhat before the Augustan age. Some of his writings were used by the transcribers and in the middle ages, as the foundation of their prose versions of Æsopian fables, and have thus been preserved. A few have likewise been preserved in an entire form, and several fragments are cited in the 'Lexicon' of Suidas. Collections of the extant fables and fragments of this poet have been made by several scholars. (Tyrwhitt, 'Dissertatio de Babrio;' Schneider, 'Fabulæ Æsopiæ,' Vratislav., 1812; Berger, 'Babrii Fabularum Choliambicarum, libri tres:.' Bishop Blomfield in the 'Museum Criticum,' vol. i.; Mr. Burges in the 'Classical Journal,' vols. xxv. and xxvi.; 'Philological Museum,' vol. i. pp. 280-304, which contains a detailed account of the versification of Babrius, and an amended edition of his fables.) The language of Babrius is extremely terse and elegant, and his style of narration lively, pointed, and simple. Of late years a large addition has been made to our stock of the writings of Babrius by M. Minoides Minas, who among numerous manuscripts found by him in the convents of Greece, alighted upon one which contained the choliambic fables of Babrius. The monks of the convent of St. Laura on Mount Athos, where the manuscript was found, asked for the original a price so exorbitant, that M. Minas was content to take a copy of it, which he brought to Paris in 1842. M. Villemain intrusted the office of editing the fables to M. J. F. Boissonade, and the work appeared towards the end of 1844 in one octavo volume. The Greek fables which were thus rescued are not however the complete collection which Babrius made. Their number is 123; they are arranged in alphabetical order, that is, according to the initial letters of the fables, and the present collection does not go further down than the letter O. A considerable number of fables is therefore still wanting. The collection is divided into two sections, the one extending from the letter A to L, and the other from M to O inclusive, and each of them is preceded by a proœmium. Boissonade has added a critical commentary and a Latin translation: the title is Βαβριῶν Μυθολογίαι. 'Babrii Fabulæ Iambicæ CXXIII, nunc primum editæ. J. F. Boissonade recensuit, Latine convertit, annotavit,' Paris, 1844, 8vo. (*Classical Museum*, part vi. p. 412, &c.)

BA'CCHIUS, sometimes incorrectly called *Vaccæus*, is a Greek writer on music. His work is entitled *Εἰσαγωγή τέχνης μουσικῆς*, 'An Introduction to the Art of Music,' in questions and answers. Bacchius follows in general the system of Aristoxenus. His epoch is uncertain; Meibomius conjectured that he lived after Ptolemæus; Fabricius has tried to identify him with the Bacchius whom M. Aurelius Antoninus mentions ('de Rebus suis,' i. 6) as his earliest teacher. The work of Bacchius is contained in the collection of Meibomius—'Antiquæ Musicæ Auctores Septem,' Amsterdam, 1652.

BACCHY'LIDES, a Greek poet and a nephew of the elder Simonides, was a native of the island Ceos. He probably lived in the first half of the 5th century before the Christian era, was a contemporary of Pindar, though younger than that celebrated poet; and is said to have resided in the court of Hiero, king of Sicily. His compositions were numerous and very various, consisting of hymns, dithyrambic poems, odes in celebration of the Pythian victors, amatory poems, &c., all of which are now lost except a few small pieces, twenty in number. The fragments of Bacchylides were published separately by C. F. Neue, 'Bacchylidis Cei Fragmenta,' Berlin, 1822, 8vo. They are translated in Merivale's edition of Bland's 'Anthology,' pp. 75-80.

BA'CCIO DELLA PORTA. This distinguished painter was so named from having resided near the gate of St. Peter's, at Florence; but he is more generally recognised by the name of Frate Bartolomeo di San Marco. He was a native of the district of Savignano, and born in the year 1469. He passed some years under the tuition of Cosimo Rosselli at Florence, but it was from the great father of modern art, Leonardo da Vinci, that he obtained the first idea of that effective style of colour and chiar' oscuro by which his subsequent works are distinguished. He attempted to acquire fixed principles of form and

ideal character from ancient sculpture; and, in company with his friend, Mariotto Albertinelli, he drew and modelled from statues and bassi-rilievi with indefatigable attention. He had acquired considerable proficiency in those studies when he made the acquaintance of the celebrated Dominican, Savonarola, who exercised a considerable influence over his mind, and induced him to destroy, on account of their nudity, a prodigious number of studies which he had made of the human figure. Subsequently to this period Bartolomeo seldom treated subjects which exhibited the naked form, but the knowledge he had previously acquired of it is perceptible in the fine understanding of the figure, which is visible through his draperies. His early works were of small dimensions, and distinguished by graceful composition and high finishing; but it was in the fresco of the Last Judgment, painted for the chapel of Sta. Maria Nuova, that the grandeur of his style and the extent of his powers were first manifested. Shortly after the completion of this piece, Bartolomeo being at work in the convent of St. Mark, a forcible entry was made into the monastery by the pope's officers for the purpose of seizing the person of Savonarola; a formidable resistance was made by the monks, but the unhappy zealot was borne away, and expiated his opinions at the stake. This event affected Bartolomeo so strongly, that he determined on devoting himself to the cloister, and in 1500 he took the habit of St. Dominic. In 1504 Raffaele made a visit to Florence, and an intimacy commenced between him and Bartolomeo, who communicated to his great contemporary his own principles of colouring, and received from him in return some instructions in perspective. Shortly afterwards Bartolomeo went to Rome, where his mind, naturally timid and sensitive, appears to have been so overwhelmed by the contemplation of the great works of Michel Angelo and Raffaele, that it was with difficulty he persuaded himself to make any practical effort; he painted however two single figures of St. Peter and St. Paul, which were long preserved in the palace of the Quirinal. By his visit to the Vatican he added a purer and more correct taste in design to his own bold style of relief and powerful colouring, and the sublime figure of St. Mark (now in the gallery of Florence) was alone a sufficient proof that he had no reason to shrink from any competition. The great vice of the Florentine school was an ostentatious display of anatomy, which not unfrequently gave to their works, both in painting and sculpture, an appearance little short of disgusting. The fine feeling and good sense of Bartolomeo led him to avoid this error. The subjects in which Bartolomeo delighted were such as most accorded with his strong religious feeling, and gentle temper—Saints, Evangelists, and Madonnas, with the Divine Infant, surrounded by angelic choirs. Bartolomeo died in the convent of St. Mark, in 1517, aged forty-eight. His works are numerous in Italy, and there are some good specimens in the private galleries of England: but the national collection is without any example of this great painter.

BACH, JOHANN SEBASTIAN, whose name holds so conspicuous a place in the musical history of Germany, and from the various branches of whose family have sprung more organists and able contrapuntists than any one family ever produced, was born at Eisenach, in the circle of Upper Saxony, in 1685. He belonged to a family in which the musical faculty seems to have been very largely developed. The founder was Veit Bach, a miller and baker at Presburg, in Hungary, early in the 16th century, who, being obliged to quit his country on account of religious troubles, settled at a village near Saxe Gotha. In the 'Allgemeine Musikalische Zeitung' (1823), is a curious genealogical tree of the Bach family—John Sebastian appearing in the fifth generation—which shows that, down to the middle of last century, there were fifty-eight male descendants from Veit, all of whom, according to Forkel, were professors of music.

When John Sebastian had not quite completed his tenth year, he lost his father, musician to the court and town of Eisenach, and was obliged to claim the protection of an elder brother, organist at Ordruff, who gave him some instructions on the clavicord. His brother soon dying, John Sebastian was again left destitute, when he accompanied one of his schoolfellows to Lüneburg, and entered the choir of St. Michael's as a soprano singer. There he for a while obtained a good livelihood by his fine voice, but on its changing, he found himself once more for some time without resource. In 1703 he became court musician at Weimar; but exchanged this place the year following for that of organist to the new church at Arnstadt. His reputation now began to spread, and in 1708, the reigning Duke of Weimar, offering him the appointment of court organist, he accepted the situation. This afforded him an opportunity of communicating with and hearing many of the great musicians of his day, and his studies continuing unremitting, he became master of every branch of his science. In 1717 he was made director of the concerts, and in executing the duties of this office, he had to compose sacred music for the service of the duke's chapel.

About this time M. Marchand, the celebrated French organist, having visited Dresden, accepted a challenge for a musical contest between himself and John Sebastian Bach; but when the appointed day arrived, and a large company had assembled, it was found that the French musician had left Dresden that very day, without taking leave of a single individual. The king desired that a present of 100 Louis d'or should be sent to Bach, but they never came into his possession. After this, Bach accepted the office of 'kapellmeister' to the Prince

of Anhalt-Cöthen, in which he continued six years. In 1723 he was appointed director of music and cantor to St. Thomas's School at Leipzig, which place he held till his death. On the decease of Prince Leopold of Anhalt-Cöthen, he wrote a funeral cantata, in which are some of his finest double choruses. He now accepted two situations which were little more than honorary—kapellmeister to the Duke of Weissenfels, and court composer to the King of Poland, elector of Saxony.

Bach's second son, Carl Philipp Emanuel, entered the service of Frederic the Great in 1740. The king often expressed a desire to receive a visit from John Sebastian, who, after considerable delay, went to Potsdam, just as the king's concert was on the point of commencing; and was cordially welcomed by Frederic, who suspended the concert that he might at once witness his musical powers. During the evening Bach asked his majesty for a subject on which he might play a fugue. This was immediately given, for the king wrote music very readily, and the voluntary task was executed most satisfactorily. The royal dilettante then asked for another fugue, to be in six parts, which was immediately executed, to the astonishment of all present. After his return to Leipzig he composed the subject given him by the king, in three and six parts, and had it engraved, under the title of 'Musikalisches Opfer' (Musical Offering), and dedicated it to the inventor.

Bach's uninterrupted studies affected his eyes, and an operation which was tried on them having proved unsuccessful, he became quite blind. His constitution was also affected, and he continued declining for half a year. Ten days before his death he was suddenly enabled to see again; but in a few hours he was attacked by apoplexy, and after lingering some time, he expired on the 30th of July, 1750, in the sixty-sixth year of his age. He was twice married, and had by his first wife seven children; by his second, thirteen; in all, eleven sons and nine daughters.

So great was Sebastian Bach as an organ-player, that he had only one rival; but that one was Handel, and something similar might be said of him as a composer for the organ. Bach's compositions, in almost every class, are very numerous; of these, perhaps the most generally known out of Germany are his 'Clavecin bien-Tempéré,' or Preludes and Fugues in all the tones and semitones, major and minor, which were composed as exercise for his sons; but his vocal works are more likely to maintain his popularity with the general public. Among them are the funeral cantata before mentioned, a magnificat, a motet, several 'chorals,' or psalm-tunes, and, above all, his 'Passionsmusik,' which is a work of great genius as well as science.

Bach's fame has of late years been steadily advancing with English musicians, in proportion with the advance among them of a higher scientific culture. In London, following the example of various cities of Germany, there was in 1850 a Bach Society formed by several of the leading members of the musical profession, for the special study and practice of the compositions of Sebastian Bach. Some of his great works have since been performed for the first time in London, and listened to with interest by the general public. But it is not to be expected that his works will ever be what is termed popular. Their immense difficulty will always prevent his great works from being frequently played; and their grandeur is not likely to be felt by the un instructed auditor to whom their elaborate structure is unfamiliar. The greatness and power, and the consummate science of Bach, can be appreciated only by the highly educated musician; and with him the name of Bach will be sure to stand among the very foremost in the list of musical composers. During the last few years some approaches have been made towards collecting and publishing a complete edition of his numerous works; several of his more important vocal pieces, his grand mass in B minor, &c., have been issued by the Leipzig Bach Society; and many of his instrumental pieces have appeared under the editorial care of M. Peters of Leipzig.

BACH, FRIEDEMANN, eldest son of Sebastian, followed in his father's footsteps as a performer. He preferred playing extemporaneously, and therefore left but little behind him; but some few fugues which are published, are undeniable proofs of his knowledge and talent. He died at Berlin in 1784, in very distressed circumstances.

BACH, CARL PHILIP EMANUEL, second son of Sebastian, was born at Weimar in 1714. He was educated as a civilian, but adopted music as his profession. In 1738 he went to Berlin, and entered the service of Frederic the Great in 1740. In 1767 he succeeded Telemann, as music-director at Hamburg, and likewise became 'kapellmeister' to the king's sister—the Princess Amelia. He died in 1788. Emanuel Bach composed much for the piano-forte, and it has been said that Haydn was much indebted to him for his style; but this may be fairly doubted. His works scarcely seem to justify the panegyrics which have been lavished on his powers of composition.

BACH, JOHANN CHRISTIAN, called Bach of Milan, and afterwards of London, was not instructed by his father, but received his musical education chiefly in Italy. He came to England in 1763, to compose for the King's Theatre, and produced some operas, which were superior to most of the works then in vogue, but have long been forgotten. Soon after the marriage of George III., Christian was appointed music-preceptor to Queen Charlotte, of which office he enjoyed the salary till his death. In conjunction with Abel he commenced and carried on for nearly twenty years a series of subscription concerts, which

were extremely successful. He composed much, and of all kinds, but his works are now scarcely remembered. He died in London in 1782.

BACIOCCHI, MARIE ANNE ELISA BONAPARTE, the eldest of the sisters of Napoleon I., born at Ajaccio in Corsica, in 1777, received her early education in the Royal school of St.-Cyr, near Paris. When that institution was suppressed by the National Convention, in 1792, Marie Anne Bonaparte returned to Corsica, whence she emigrated with her mother and sisters to Marseille, the English having occupied her native island. At Marseille she married, in 1797, her countryman Captain Baciocchi, a retired officer of the former Royal Corsican regiment. In the following year she removed to Paris, where her brother Lucien was a member of the Council of the Five Hundred, and she undertook to do the honours of his saloon. Here she became acquainted with several literary and scientific men, with whom she loved to dispute upon all sorts of topics. She rose in rank and station with the rest of her family, in consequence of her brother Napoleon's elevation to supreme power. After his assumption of the imperial crown, Napoleon made Baciocchi and his wife Prince and Princess of Piombino, and soon after of Lucca, when Marie Anne assumed the name of Elisa. In 1806 she received the principality of Massa and Carrara. Her administration—for in it her husband had no share—was upon the whole beneficial to Lucca, where she fixed her residence. In March, 1809, Napoleon by a decree appointed the Princess Elisa to be Grand Duchess of Tuscany, and to administer in his name the three departments into which that country was divided as a part of the French empire. Her husband was not named in the imperial decree. In consequence of this new appointment, the Princess Elisa removed to Florence, where she kept her court until the downfall of Napoleon. She was by no means popular at Florence, partly, perhaps, because she was there a mere lieutenant of her imperious brother, and as such was obliged to enforce all his obnoxious measures—the conscription, the burdensome taxation, the rigorous police, &c. But it seems also as if her removal to a larger sphere of administration had rendered Elisa more haughty, harsh, and self-willed. She became very fond of military pomp and parade. In 1814, when the allied armies advanced into Tuscany, Elisa left Florence, and in the following year went to Heimbürg, near Vienna, where her sister Caroline Murat had taken up her residence. She afterwards removed to Bologna in the Papal States, where she went by the name of Countess of Caupugnano. She died at Bologna, of a nervous fever, in August 1820, leaving a son, Frederic Baciocchi, who died at Rome in 1833 of a fall from his horse, and a daughter, who married Count Camerata of the Papal States. The father, Felice Baciocchi, purchased the splendid palace of Rauuzzi at Bologna and the title of a Roman prince, and died there in 1841. (*Lesur, Annuaire Historique; Duchesse d'Abrantes, Salons de Paris; Biographie Universelle.*)

*BACK, SIR GEORGE, was born at Stockport in 1796, and entered early into the naval service of his country. In 1809, when serving as midshipman on board the 'Arethusa,' he was taken prisoner by the French, and only recovered his liberty on the termination of the war. Having little hope of employment during the peace, he turned his energies into another direction. He accompanied Sir John Franklin on his northern voyage in 1818; and afterwards in the first and second voyages of the same commander (in 1819 and 1823) to explore the Arctic Regions. Like the rest of his associates, he suffered great privations in these voyages, and endured severe hardships, but his ardour was unchecked. In 1833 he offered to undertake an overland journey in search of Captain Ross, who had left England in 1829 to attempt the North-West Passage, and had been long unheard of. Back's offer was accepted; he left England in February, accompanied by Dr. King, and proceeded by the North American lakes, and the Hudson's Bay Territories, to the shores of the Polar Sea. While on his way he was made acquainted with the safe return of Captain Ross, but determined to proceed for the purpose of extending the geographical knowledge of those regions. From Sussex Lake he descended a river, now named the Back River, impeded by rapids, dangerous falls, and sand-banks, till he reached the Polar Sea at Cockburn Bay, in 67° N. lat., 90° W. long. He carefully examined the coasts, and traced them as far as Bathurst Inlet. He also made some interesting observations on the aurora borealis, and its influence upon the compass. For these services he was raised to the rank of captain in 1835. In 1836, Captain Back received the command of the 'Terror,' in the expedition to examine the coasts between Regent Inlet and Cape Turnagain; but he was caught in the ice, and only with great difficulty saved his vessel. He then returned to England, and in 1838 was knighted, and received a medal from the Geographical Society for his exertions in extending geographical knowledge. Sir George has written two works on the subject of his labours—'A Narrative of the Expedition along the Shores of the Arctic Ocean in the years 1833, 1834, and 1835;' and 'A Narrative of an Expedition undertaken with a View to Geographical Discovery on the Arctic Shores.'

BACKHUYSEN, LUDOLPH, a celebrated marine-painter, was born at Embden in 1631. Being intended by his parents for a mercantile profession, he was sent to Amsterdam at the age of eighteen, and placed in the counting-house of M. Bartholet, an eminent merchant; and it was while in the employment of that gentleman that he first manifested the possession of a talent for painting. The latent faculty however was stimulated by the picturesque objects which the

sea presented to young Backhuysen before the windows of his office, and his first delineations were of shipping, done with a pen in a style of extraordinary beauty and correctness. These drawings excited such surprise and admiration, that it became a fashion to possess them, and they were sold at the prices of 10, 20, and even 100 florins each. Backhuysen now determined on relinquishing his commercial pursuits, and devoting himself to art. His first instructor was Albert Van Evendingen; but he made acquaintance with all the artists in the city, and spent a large portion of his time in their studies, by this means acquiring a full mastery in the executive part of his art. But his study was the gale and the storm; nor did he shrink from the perils which accompanied the study of Nature in her sternest and most appalling aspects. By large rewards he was accustomed to induce boatmen to put to sea at times when no other person would venture from shore. Amidst the dash of waves, the roaring of breakers, and the danger of vessels, he it is said sat making his sketches with perfect composure. He stamped, by this mode of study, a character of truth on his works which could have been obtained by no other means; and he acquired the rare distinction of forming a style peculiarly his own. So earnest was he in this course of practical study, that the moment he landed from his marine excursions, he hastened to his painting-room, nor would he admit the visits of his most intimate friends until he had transmitted his impressions to canvass. He was singularly industrious, and the number of his works is astonishing. But one mischievous result of this unceasing labour was that he fell into a sort of mechanical mannerism, which is very unpleasantly evident in many of his later works. Still his pictures possess, in a very high degree, the peculiar excellencies of the Dutch school,—richness, transparency, delicate handling, and appropriate, though in his case a somewhat heavy colour. Few artists have excelled him in the art of giving depth without darkness: frequently, in his pictures of an approaching storm, the very atmosphere seems to labour with gloom, yet the clearness of effect is not in the least impaired.

Backhuysen's merits were fully appreciated in his own lifetime. His works were eagerly sought after: among other important commissions, he was employed by the burgomasters of Amsterdam to paint a large picture, with a multitude of vessels, and a view of the city at a distance; for which he received 1300 guilders, and a present also of considerable value. This picture was sent, in 1665, as a present to Louis XIV., who placed it in the Louvre. Many royal personages honoured the artist by visiting his study, among them the king of Prussia, and the Czar Peter; the latter especially found his taste for nautical affairs gratified by the frequent inspection of his works. He engaged Backhuysen to make designs of various vessels, and delighted to converse with him on the mode of constructing and manœuvring them, in which Backhuysen was thoroughly skilled. At the age of 71, he amused himself with etching a set of views on the Y, near Amsterdam. He died in 1709, aged 78 years. His pictures are numerous in Holland, and not unfrequent in English collections. Many of them have been engraved, and some were etched by himself.

BACON, ROGER, the greatest of English philosophers before the time of his celebrated namesake, was born near Ilchester, in Somersetshire, about the year 1214. He was educated at Oxford, and, according to the usual custom of his day, proceeded to Paris, which was then the first university in the world. The course of study in vogue, however unfavourable to independence of thought, did not give so great a preponderance to the works of Aristotle as was afterwards the case. The theology of the day had set strongly against philosophy of every species. In 1209, a council at Paris condemned and burnt, if not the works of Aristotle, at least the mutilated and interpolated translations from the Arabic which then existed. But towards the middle of the century, Latin versions of Aristotle's works began to appear, and the philosophy contained in them to be warmly advocated by the new orders of Franciscans and Dominicans, and particularly by Albertus Magnus. The reputation of Aristotle from this time advanced so rapidly, that he had gained the exclusive title of 'the Philosopher' by the time Roger Bacon wrote his 'Opus Majus.' But Bacon, who was better versed in the original than most of his contemporaries, freely criticises all he meets with (especially the merit of the translations, all which he says he would burn, if he could), and is himself an early and sufficient proof that the absurdities of his contemporaries ought not to be called 'Aristotelian,' any more than Aristotle himself 'the Philosopher.'

After his return to Oxford, with a doctor's degree granted at Paris, which was immediately also confirmed by the Oxford university, he took the vows of a Franciscan in a convent possessed by that order at Oxford, on the persuasion, it is said, of Robert Greathead or Grostête, bishop of Lincoln. From the time of his return, which is stated to have been in 1240, he applied himself closely to the study of languages, as well as to experimental philosophy. The vow of the Franciscans was poverty, manual labour, and study; but the first two were soon abandoned. Bacon does not appear to have wanted means, for he says himself that in twenty years he spent 2000 livres (French) in books and instruments; a very large sum in those days. His brethren soon began to manifest a spirit of enmity, a prohibition being issued against Bacon's lectures in the University, as well as against the transmission of any of his writings beyond the walls of his convent. The charge made against him was that of magic, which was then frequently

brought against those who studied the sciences, and particularly chemistry. Brought up to consider philosophy as nearly allied to, if not identical with, heresy itself, many of the clergy of that day were no doubt honest believers in its magical power; but we can hardly doubt that there were a few more acute minds, who saw that Roger Bacon was in reality endeavouring to evoke a spirit whose influence would upset the power they had acquired over the thoughts of men, and allow them to read and reflect, without fear of excommunication, or the necessity of inquiring what council had authorised the book. The following detached passages of the 'Opus Majus' no doubt contain opinions which its author was in the habit of expressing, and they deserve attention as illustrative of the teaching of the father of English philosophy:—"Most students have no worthy exercise for their heads, and therefore languish and stupefy upon bad translations, which lose them both time and money. Appearances alone rule them, and they care not what they know, but what they are thought to know by a senseless multitude.—There are four principal stumbling-blocks in the way of arriving at knowledge—authority, habit, appearances as they present themselves to the vulgar eye, and concealment of ignorance combined with ostentation of knowledge.—Even if the first three could be got over by some great effort of reason, the fourth remains ready.—Men presume to teach, before they have learnt, and fall into so many errors, that the idle think themselves happy in comparison—and hence both in science and in common life we see a thousand falsehoods for one truth.—And this being the case, we must not stick to what we hear and read, but must examine most strictly the opinions of our ancestors, that we may add what is lacking, and correct what is erroneous, but with all modesty and allowance.—We must, with all our strength, prefer reason to custom, and the opinions of the wise and good to the perceptions of the vulgar: and we must not use the triple argument; that is to say, this has been laid down, this has been usual, this has been common, therefore it is to be held by. For the very opposite conclusion does much better follow from the premises. And though the whole world be possessed by these causes of error, let us freely hear opinions contrary to established usage."

As might be supposed, Roger Bacon cultivated the acquaintance of men who held similar sentiments. Among them was Grostête, bishop of Lincoln, who usually resided at Oxford. Grostête, who was a good mathematician, and a resolute opponent of undue interference on the part of the see of Rome, had opposed Innocent IV., who attempted to appoint his nephew, a boy, to a prebend at Lincoln. On being excommunicated, Grostête appealed from the tribunal of Rome to that of Christ. It is not unlikely that the subsequent imprisonment of Bacon was prolonged in consequence of the feelings still cherished in reference to the independent conduct of his friend Bishop Grostête. In the year 1265, Clement IV. was placed in the papal chair. He had previously, when cardinal-bishop of Sabina, been legate in England, and had heard of Bacon's discoveries, and earnestly desired to see his writings; but, as before stated, the prohibition of the Franciscans prevented his wish being complied with. After his election as head of the Church, Bacon, conceiving that there would be neither danger nor impropriety in disobeying his immediate superiors at the command of the pope, wrote to him, stating that he was now ready to send him whatever he wished for. The answer was a repetition of the former request; and Bacon accordingly drew up the 'Opus Majus,' of which it may be presumed he had the materials ready. It appears that he had mentioned the circumstances in which he stood; for Clement's answer requires him to send the work with haste, any command of his superiors or constitution of his order notwithstanding, and also to point out, with all secrecy, how the danger mentioned by him might be avoided. The book was sent in the year 1267, by the hands of John of London, a pupil whom he in one place commends as one of the only two good mathematicians he knows. Before the 'Opus Majus,' Bacon, according to his own account, had written nothing except a few slight treatises, 'capitula quedam.'

With the 'Opus Majus' he sent, it is said, also two other works, the 'Opus Minus' and the 'Opus Tertium,' the second a sort of abstract of the first, and the third a supplement to it. These works exist in manuscript in the Cottonian Library, but have not been printed. Of the 'Opus Tertium' a second manuscript was discovered a few years back in the library at Douay by M. Victor Cousin, who has given an account of it and an elaborate criticism on Roger Bacon's writings and character as a philosopher in the 'Journal des Savants' for 1848. The Douay manuscript is incomplete, but it supplies the deficiencies in the British Museum copy. It appears that, after the death of Clement, which took place in November 1268, Bacon revised and augmented the 'Opus Minus.' What reception Clement gave them is not certainly known, but he could scarcely have received the work before he was seized with his last illness.

Till the year 1278 Bacon was allowed to remain free from open persecution, but in that year Jerome of Ascoli, general of the Franciscan order, afterwards pope under the title of Nicholas IV., being appointed legate to the court of France, this was thought a proper opportunity to commence proceedings. Bacon, then sixty-four years old, was accordingly summoned to Paris, where a council of Franciscans, with Jerome at their head, condemned his writings, and committed him to close confinement. We cannot learn that any offer of pardon was

made to the accused upon his recantation of the obnoxious opinions, as usual in such cases, which, if we may judge from the 'Opus Majus,' Bacon would have conceived himself bound to accept, at least if he recognised the legality of the tribunal. A confirmation of the proceeding was immediately obtained from the court of Rome. During ten years every effort made by him to procure his enlargement was without success. The two succeeding pontiffs had short and busy reigns, but on the accession of Jerome (Nicholas IV.) Bacon once more tried to attract notice. He sent to that pope, it is said, a treatise on the method of retarding the infirmities of old age, the only consequence of which was increased rigour and closer confinement; but that which was not to be obtained from the justice of the pope was conceded to private interest, and Bacon was at last restored to liberty by the intercession of some powerful nobles. Some say he died in prison; but the best authorities unite in stating that he returned to Oxford, where he wrote a compendium of theology, and died shortly after Nicholas IV., probably in 1292, as Anthony à Wood states. He was buried in the church of the Franciscans at Oxford.

Of the asserted works of Bacon there is a very large catalogue, cited mostly from Bale and Pits, in the preface to Dr. Jebb's edition of the 'Opus Majus.' They amount to 101 treatises in all, on a great variety of subjects; but probably most of these were extracts from the 'Opus Majus,' &c., with separate titles, while others are improperly attributed to Roger Bacon. The principal manuscripts of the 'Opus Majus' are—one in Trinity College Library, Dublin, discovered by Dr. Jebb, which forms the text of his edition; two in the Cottonian Library, one in the Harleian, one in the library of Corpus Christi College, Cambridge; one in that of Magdalen College, two in the King's Library—all containing various parts of the work. These are independent of the 'Opus Minus' and 'Opus Tertium' in the Cottonian Library, already mentioned; of some in Lambeth palace, in the Bodleian Library at Oxford, and of several others at home and abroad. Pope Clement's letters are in the Vatican library.

Of printed works we have found the following:—'Perspectiva,' Frankfurt, 1614; 'De Speculis' and 'Specula Mathematica,' Frankfurt, 1614, reprinted in 1671; 'De Mirabili Potestate Artis et Naturæ,' Paris, 1542; Girard, 'De l'Admirable Pouvoir, &c., ou est Traicté de la Pierre Philosophale' (translation of the preceding), Paris, 1557, reprinted in 1629; 'Scripta quædam de Arte Chemiæ,' Frankfurt, 1603 and 1620; 'Speculum Alchemiæ,' and 'De Secretis Operibus Artis et Naturæ, et de Nullitate Magiæ,' in vols. ii. and v. of Zetzner's 'Theatrum Chemicum,' Strasbourg, 1659; the 'Opus Majus,' edited by Dr. Jebb, London, 1733; 'De Retardandis Senectutis Accidentibus,' Oxford, 1590, translated by Dr. R. Browne, London, 1683. In a volume of tracts on 'Alchemy,' Lyon, 1557, there are two attributed to Roger Bacon; and there is one (the 'Speculum Alchemiæ,' in English) in a similar collection, London, 1683.

It only remains for us to take a general view of the character of Roger Bacon's writings, and of the contents of the 'Opus Majus.' It is surprising how little is known of this work, the only one to which we can appeal, if we would show that philosophy was successfully cultivated in an English university during the 13th century. It is of course in Latin, but in Latin of so simple a character, that we know of none in the middle ages more easy to read; and it forms a brilliant exception to the stiff and barbarous style of that and succeeding times.

The charge of heresy appears to be by no means so well founded as a Protestant would wish. Throughout the whole of his writings Bacon is a strict Roman Catholic, that is, he expressly submits matters of opinion to the authority of the Church. His zeal for Christianity, in its Latin or western form, breaks out in every page; and all science is considered with direct reference to theology, and not otherwise: but at the same time, to the credit of his principles, considering the persecuting age in which he lived, there is not a word of any other force except that of persuasion. He takes care to have both authority and reason for every proposition that he advances; perhaps indeed he might have experienced forbearance at the hand of those who were his persecutors, had he not so clearly made out prophets, apostles, and fathers to have been partakers of his opinions. "But let not your Serenity imagine," he says, "that I intend to excite the clemency of your Holiness, in order that the papal majesty should employ force against weak authors and the multitude, or that my unworthy self should raise any stumbling-block to study." Indeed the whole scope of the first part of the work is to prove, from authority and from reason, that philosophy and Christianity cannot disagree—a sentiment altogether of his own revival, in an age in which all philosophers, and mathematicians in particular, were considered as at best of dubious orthodoxy.

The reasoning of Bacon is generally directly dependent upon his premises, which, though often wrong, seldom lead him to the prevailing extreme of absurdity. Even his astrology and alchemy, those two great blots upon his character, as they are usually called, are, when considered by the side of a later age, harmless modifications, irrational only because unproved, and neither impossible nor unworthy of the investigation of a philosopher, in the absence of preceding experiments. His astrology is physical. "With regard to human affairs, true mathematicians do not presume to make certain, but consider how the body is altered by the heavens; and the body being altered, the mind is

excited to public and private acts, free will existing all the same." He appears to have firmly believed in planetary influence, and in particular the effect of the constellations on the several parts of the human body.

We must draw a wide distinction between the things which Bacon relates as upon credible authority, and the opinions which he professes himself to entertain from his own investigations. In almost every page we meet with something now considered extremely absurd, and with reason. But before the multiplication of books, and the free interchange of facts and opinions by means of the printing-press, a book which was written in one country found its way but slowly into others, one copy at a time; and a man of learning seldom met those with whom he could discuss the probability of any narrative. The adoption of the principle that a story must be rejected because it is strange, would then have amounted to a disbelief of all that had been written on physics—a state of mind to which we cannot conceive any one of that age bringing himself. Nor can we rightly decide what opinion to form of Bacon as a philosopher, until we know how much he rejected as well as how much he believed. These remarks apply particularly to his alchemy: he does not say he had made gold himself, but that others had asserted themselves to have made it; and his account of the drink by which men had lived hundreds of years is a relation taken from another. It is fair to notice that there is not in Bacon's alchemy any direction for the use of prayers, fasting, or planetary hours.

The great points by which Bacon is known are his reputed knowledge of gunpowder and of the telescope. With regard to the former, it is not at all clear that what we call gunpowder is intended, though some detonating mixture, of which saltpetre is an ingredient, is spoken of as commonly known. The passage is as follows:—"Some things disturb the ear so much, that if they were made to happen suddenly, by night, and with sufficient skill, no city or army could bear them. No noise of thunder could compare with them. Some things strike terror on the sight, so that the flashes of the clouds are beyond comparison less disturbing; works similar to which Gideon is thought to have performed in the camp of the Midianites. And an instance we take from a childish amusement, which exists in many parts of the world, to wit, that with an instrument as large as the human thumb, by the violence of the salt called saltpetre, so horrible a noise is made by the rupture of so slight a thing as a bit of parchment, that it is thought to exceed loud thunder, and the flash is stronger than the brightest lightning." 'Opus Majus,' p. 474.

There are indeed passages in the work 'De Secretis Operibus,' &c. (cited by Hutton, 'Dictionary,' article 'Gunpowder'), which expressly mention sulphur, charcoal, and saltpetre as ingredients. But independently of the claim of the Chinese and the Indians, the receipt for gunpowder is given by Marcus Græcæus, who is mentioned by an Arabic physician of the 9th century, in his work, 'Liber Ignium,' now existing only in Latin translations from the Greek.

With regard to the telescope, it must be admitted that Bacon had 'conceived' the instrument, though there is no proof that he carried his conception into practice, or 'invented' it. His words are these:—"We can so shape transparent substances, and so arrange them with respect to our sight and objects, that rays can be broken and bent as we please, so that objects may be seen far off or near, under whatever angle we please; and thus from an incredible distance we may read the smallest letters, and number the grains of dust and sand, on account of the greatness of the angle under which we see them; and we may manage so as hardly to see bodies, when near to us, on account of the smallness of the angle under which we cause them to be seen; for vision of this sort is not a consequence of distance, except as that affects the magnitude of the angle. And thus a boy may seem a giant, and a man a mountain," &c. The above contains a true description of a telescope; but if Bacon had constructed one he would have found that there are impediments to the indefinite increase of the magnifying power, and still more that a boy does not appear a giant, but a boy at a smaller distance.

It is worth notice, that these ideas of Bacon did, in after times, produce either the telescope, or some modification of it, consisting in the magnifying of images produced by reflection, and that before the date either of Jansen or Galileo. Thomas Digges, son of Leonard Digges, in his 'Stratoticos,' London, 1590, p. 359, thus speaks of what his father had done, in the presence, as he asserts, of numerous living eye-witnesses:—"And such was his Felicitie and happie successe, not only in these conclusions, but also in y^e Optikes and Catoptikes, that he was able by Perspective Glasses, duly acutuate upon convenient angles, in such sort to discover every particularitie of the country round about, wheresoener the Sunne beames might pearse: as sithence Archimedes (Bacon of Oxford onely excepted) I have not read of any in action ever able by means natural to performe the like. Which partly grew by the aid he had by one old written book of the same Bakon's Experiments, that by strange adventure, or rather Destinie, came to his hands, though chiefly by conioyning continuall laborious Practise with his Mathematical Studies." The same Thomas Digges, in his 'Pantometria,' London, 1591, Preface, repeats the story with more detail, omitting however all mention of Bacon.

The question has been agitated whether the invention of spectacles is due to Bacon, or whether they had been introduced just before he

wrote. He certainly describes them, and explains why a plane convex glass magnifies. But he seems to us to speak of them as already in use. "Hence this instrument is useful to old persons and those who have weak eyes."

The 'Opus Majus,' as published by Dr. Jebb, consists of six books or parts. It begins with a book on the necessity of advancing knowledge, and a dissertation on the use of philosophy in theology. It is followed by books on the utility of grammar and mathematics; in the latter of which he runs through the various sciences of astronomy, chronology, geography, and music. The account of the inhabited world is long and curious, and though frequently based on that of Ptolemæus or the writings of Pliny, contains many new facts from travellers of his own and preceding times. His account of the defects in the calendar was variously cited in the discussions which took place on the subject two centuries after. The remainder of the work consists of a treatise on optics and on experimental philosophy, insisting on the peculiar advantages of the latter. The explanation of the phenomena of the rainbow, though very imperfect, was an original effort of a character altogether foreign to the philosophy of his day. He attributes it to the reflection of the sun's rays from the cloud; and the chief merit of his theory is in the clear and philosophical manner in which he proves that the phenomenon is an appearance, and not a reality. Between the two last-mentioned books is a treatise, 'De Multiplicatione Specierum,' entirely filled with discussions somewhat metaphysical upon the connection and causes of phenomena. A seventh book on moral philosophy completed the work in its original state; but this book has been lost or overlooked. M. Cousin says that the Douay manuscript of the 'Opus Tertium,' noticed above, makes express and precise reference to the treatise on moral philosophy, of which the 'Opus Tertium' professes to be an abridgment, with certain emendations.

BACON, SIR NICHOLAS, father of Sir Francis Bacon, and Lord Keeper of the Great Seal of England during the first twenty years of the reign of Elizabeth, was descended from an ancient and wealthy family in Suffolk, and was born in the year 1510 at Chiselmhurst in Kent. He received his scholastic education at Bene't (Corpus Christi) College, Cambridge, and having finished his course of study there, spent a considerable time abroad, and particularly at Paris, for the purpose of completing his education. On his return to England he kept his terms at Gray's Inn, and was called to the bar in that society. In 1537, when he was only twenty-seven years of age, he was appointed solicitor to the Court of Augmentations, and in 1546 he was promoted by Henry VIII. to the office of attorney of the Court of Wards, a place of considerable emolument and responsibility, which he continued to hold during the reign of Edward VI. Upon the dissolution of the monasteries in 1539, Sir Nicholas Bacon prepared and presented to Henry VIII. a written project for the formation of a college for the study of politics and diplomacy, to be endowed with part of the property of the dissolved religious houses. This design miscarried, probably, as Burnet suggests, because the king, "before he was aware of it, had so outrun his bounty, that it was not possible for him to bring any such projects to effect." Having adopted the Protestant faith, Sir Nicholas Bacon was excluded from all favour or public employment during the reign of Mary; but upon the accession of Elizabeth he was selected, with Sir William Cecil, Sir Francis Knollis, and several others of the Protestant party, to be of her privy council, and to qualify the influence of those of the Catholic party whom she thought it prudent to retain as her advisers. With Cecil he was connected not only by opinion and politics, but by relationship, as they both married daughters of Sir Anthony Cooke, of Giddy Hall, in Essex. In December 1558 the queen gave the Great Seal to Sir Nicholas Bacon, making the appointment by letters-patent, which rendered the office permanent, and expressly gave him all the rank and authority of a Lord Chancellor.

On the 25th of January 1559 Sir Nicholas Bacon opened the first parliament of Elizabeth with a temperate speech, recommending in particular to the Lords and Commons a candid consideration of the religious differences which then agitated the nation, with a view to their satisfactory arrangement. This speech is a judicious performance, well calculated to conciliate contending factions and to remove the difficulties by which Elizabeth's government was beset at the commencement of her reign. One of the most serious of these difficulties was the settlement of religion, and in this work Sir Nicholas Bacon was an important instrument both in council and in action. In March 1559 the queen appointed a public conference to be held in Westminster Abbey, for the purpose of discussing several controverted points in the doctrines and ceremonies of the Church of Rome. It was agreed that nine divines should argue on each side, and Sir Nicholas Bacon, as Lord Keeper, was nominated president, or moderator. The conference, as is well known, ended abruptly, and without any approach towards an agreement.

Bacon's intimacy with Sir William Cecil, as well as his own upright and manly conduct, enabled him generally to retain the favour of the queen; but in 1564 he was suspected of having approved, and even assisted in writing, a book, published by one Hales, which questioned the title of Mary, queen of Scotland, to succeed, after Elizabeth, to the English throne. This was opposed to the sentiments at that time held both by Elizabeth and the Earl of Leicester; and when the book

was expressly complained of by Mary's ambassador, the disapprobation of the court made itself decisively felt. Hales was committed to the Tower, and the Lord Keeper, who is said not to have had more hand in the book than Sir William Cecil, was dismissed from the privy council and from court, and discharged from all interference with public affairs except in the Court of Chancery. At length however, by the assistance of Cecil, who continued through life his firm friend, Bacon succeeded in reinstating himself in the good opinion of the queen; and from that time until his death he appears to have enjoyed her favour and full confidence without interruption. In 1577 the queen visited him at the splendid mansion which he had lately built at Gorhambury, in Hertfordshire; and it was to that occasion that the anecdote refers which is related by Lord Bacon in his 'Apophthegms.' Upon the queen's telling him "that his house was too little for him," he happily replied, "Not so, madam; but your majesty has made me too great for my house."

Sir Nicholas Bacon died on the 20th of February 1579, in the 70th year of his age. The character of his mind, as given by his son, Lord Bacon, appears to be just and accurate, and is consistent with the facts which are recorded of his life and conduct. "He was," says he, "a plain man, direct and constant, without all finesse and doubleness, and one that was of a mind that a man, in his private proceedings and estate, and in the proceedings of state, should rest upon the soundness and strength of his own courses, and not upon practice to circumvent others."

Many speeches of Sir Nicholas Bacon as Lord Keeper upon formal occasions will be found in the parliamentary history of the first twenty years of Elizabeth's reign, and several addresses by him to judges on being called to the bench are still extant in various depositories of manuscripts. His addresses on these occasions are replete with good sense. Of his decisions and judgments in the Court of Chancery few records are preserved. Among the Harleian Manuscripts in the British Museum there is one (No. 39) which contains a very sensible judicial opinion pronounced by Sir Nicholas Bacon upon the question whether a peer of the realm is privileged from an attachment from the Court of Chancery for disobedience to a decree or order of that court. This question he decided in the negative.

BACON, FRANCIS, the youngest son of Sir Nicholas Bacon, was born at York House in the Strand, on the 22nd of January, 1561. In boyhood he was sprightly and intelligent beyond his years. Nothing is known of his early education. Having however parents of a superior order—a father distinguished as a lawyer and a statesman, and a mother gifted with uncommon abilities, and eminent for her learning and piety—Bacon was placed favourably, from the first, for the formation of a learned and a virtuous character. In his 13th year he was sent to Trinity College, Cambridge, and was placed under the tuition of Dr. Whitgift, at that time master of the college, and afterwards Archbishop of Canterbury. Here Bacon studied with diligence and success. Dr. Rawley, his chaplain and biographer, tells us, on the authority of Bacon himself, that when at the university, about sixteen years of age, he conceived a dislike to the philosophy of Aristotle, it being a philosophy (as he used to say) "only strong for disputations and contentions, but barren of the production of works for the life of man." This feeling he ever after retained, yet "ever ascribed all high attributes to Aristotle himself."

On leaving Cambridge, Bacon entered Gray's Inn as a student of law, but his attendance in London not being required for some years, by the regulations of his inn, he was sent, in compliance with a custom at the time common among the nobility, to study the institutions and manners of other countries. He went accordingly in the suite of Sir Amias Paulet, the British ambassador to the court of France. His superior sagacity and discretion soon induced the ambassador to intrust him with a message of some delicacy and importance to the queen; a commission which Bacon executed so as to obtain the royal approbation. On his return to Paris he made frequent excursions into the country, spent some time in Poitiers, and busied himself in collecting information on the characters and resources of the different princes of Europe. His work 'Of the State of Europe,' in which he arranged and estimated the information thus collected, and which was written when he was nineteen years of age, displays conspicuously the industry, guided by deep penetration, which characterised his youthful mind.

His studies abroad were interrupted by the death of his father in 1579. Returning to London on this occasion, he found himself the only one of his family left unprovided for; his father having been prevented by the suddenness of his death from purchasing an estate with the money set aside for his youngest son. Instead of the whole, Francis received only a fifth share of the money. This caused him 'straits and difficulties' in his youth. When a student in Gray's Inn, he divided his time between law and philosophy, but law was his principal study. Though when a student he sketched his great work the 'Organon,' in a piece which his youthful pride entitled 'Partus Temporis Maximus,' 'The Greatest Birth of Time,' his studies were chiefly directed to legal subjects.

On the 27th of June 1582, he was called to the bar. His practice soon became considerable. In 1586, he was made a bencher. In his twenty-eighth year he became counsel extraordinary to the queen. In 1588 he was appointed a reader to his Inn; and again, in 1600, the

Lent double-reader; appointments which were generally conferred on men of eminence in the profession, and seldom on persons so young as Bacon in years and practice, when he first received the honour. His double reading on the Statute of Uses has been re-published several times, first in 1642; and in 1804 it was edited by William Henry Rowe, as a work of high authority on the difficult subject which it investigates.

Although connected with the most powerful family of Elizabeth's reign—the nephew of Lord Burleigh, and the cousin of Sir Robert Cecil—Bacon's advancement corresponded neither to the natural influence of his talents nor the apparently favourable position in which he was placed by his connections. The Cecils represented him to the queen as a speculative man; a dangerous individual therefore in the realities of business. All that they ever procured for him was the reversion of the office of Registrar of the Star Chamber, an appointment the salary of which, 1600*l.* per annum, he did not receive till after twenty years had elapsed. The exertions of Essex in behalf of Bacon were more hearty but less efficient. The office of solicitor-general becoming vacant, Essex endeavoured to procure the place for his friend, and when baffled by the superior influence of the Cecils, he generously made him a present of Twickenham Park, worth about 1800*l.*, and so beautiful a spot, that Bacon called it 'a Garden of Paradise.'

The friendship of Bacon for this nobleman was not one of mere interest; and Essex made him this liberal present because he knew that Bacon's friendship for him had been a bar to his promotion. But a coldness came over their friendship owing to difference of policy and opinion. Bacon in vain intreated Essex to desist from the proceedings which caused his ruin. They parted on bad terms in consequence. Bacon reckoned the last act of Essex no better than madness. When ruin closed round upon him, Bacon did not desert him. Risking and encountering the displeasure of the queen on behalf of a friend, of whose conduct he did not approve, Bacon did everything that ingenious remonstrance and affectionate intreaty could do with her majesty in behalf of the ill-advised earl. Although officially called to appear as one of her majesty's counsel against his former friend, the opportunity which his position gave him of mitigating the severity of accusation, and of more effectually securing the interests of his friend at court, were not neglected by him, and the mildness of his manner of conducting the case, his choice of a party the least prominent possible, and the disinterestedness and dexterity with which he urged the queen for the pardon and restoration of Essex, appear to show that he tried at least to serve his friend in difficult circumstances. When commanded by the queen and her counsel to draw up a declaration of the treasons of Robert Earl of Essex; it was found necessary to alter and embitter it considerably, her majesty remarking on first reading it, "I see old love is not easily forgotten." By the general public Bacon's conduct was much censured, and he thought it incumbent on himself to address a letter, after the earl's execution, to one of his most devoted friends in vindication of the part which he had acted. But the vindication it must be owned is not grounded on any very noble motives.

In 1592 Bacon was returned to parliament for the county of Middlesex, and he distinguished himself in the debates by taking the popular side. His first political production, published in 1594, was occasioned by a libel, entitled 'A Declaration of the Causes of the Great Troubles.' Although charged with flattery to the queen and the ministry, the pamphlet is more a vindication of England than of its government. In 1597, his most popular work, 'Essays or Counsels, Civil and Moral,' was published; but this first edition contains only ten essays, and these in subsequent editions were enlarged to nearly double their original dimensions. About the same time appeared his 'Maxims of Law.' His circumstances at this time were very bad: he was disappointed in his attempts at forming a lucrative matrimonial connection, and was twice arrested for debt. Two years afterwards his 'History of the Alienation Office' was written: the manuscript is in the Inner Temple Library. His 'In Felicem Memoriam Elizabethæ Angliæ Reginæ' was also written about this period, but was not published until after his death. This work, entitled in English 'Felicities of Queen Elizabeth,' is a noble eulogium on the character of an illustrious princess, covering all the parts of her history with the eloquent praise of one whose admiration flowed fully, in spite of the fact that she had constantly obstructed and retarded his ambitious views and advancement. In his will he left directions for the publication of this work.

Shortly after the accession of James I. Bacon was knighted, being one of 237 who received this accession of dignity. His eloquence and information gave him great weight in the House of Commons. Having been appointed by the House to make a representation of the oppressions of the royal purveyors committed in the name of the king, he executed his delicate task with a degree of address, which combined prudence and boldness so well as to satisfy both the king and the parliament. The parliament gave him a vote of thanks, and the king made him one of his counsel, an appointment with which he also received a small pension; and he continued to rise in spite of the opposition of Cecil, now Earl of Salisbury, and the powerful rivalry of Sir Edward Coke, the attorney-general. 'The Advancement of Learning' was published in 1605. Two years after he was made solicitor-general, and his practice in Westminster Hall now rapidly

extended. About this time he married Alice, daughter of Benedict Barnham, Esq., a wealthy alderman of London. His popularity was much enhanced by the tact which he displayed in stating the grievances of the nation to the king, an undertaking intrusted to him by the Commons; and his clear address on the subject of exchanging the ancient tenures of the crown for a competent revenue, advanced his reputation still higher. Meantime he steadily kept in view the great design of his life—the development of his improved plan for studying the sciences. He published the ground-work of his 'Novum Organum Scientiarum,' his 'Cogitata et Visa,' and sent copies of it to his learned friends for examination and criticism. The 'Filium Labyrinthi' was the original draught of his 'Cogitata et Visa.' He exercised a wise caution in the gradual unfolding of his views on philosophy, and even took pains to gain a literary and philosophical reputation by writing on less perilous subjects, with the intention, as he frequently stated, of securing an amount of consideration and respect likely to protect and bulwark his peculiar and original opinions from the attacks to which they would necessarily be exposed on their first publication. With this view he wrote and published, in 1610, 'The Wisdom of the Ancients.' This production alike by its subject and the eloquent expression which it gave to the original thoughts of the writer on a theme somewhat hackneyed, had the effect of preparing persons of all varieties of opinion for receiving with respect any thing that came from his pen.

In the year 1611 Bacon was a joint judge of the Knight Marshals' Court. In 1613 he was appointed attorney-general, and elected a member of the privy council. An objection was made that a seat in the lower house of parliament was incompatible with the duties of the attorney-general in the upper house. The objection was acknowledged to be valid, but the Commons showed their regard for Bacon by overruling the objection in his favour. At this period he must have had a considerable income. His professional practice was great; the attorney-generalship was worth 8000*l.* per annum; as Registrar of the Star Chamber, he received 1600*l.*; he had a good estate in Hertfordshire, and his father's seat of Gorhambury had passed to him by the death of his brother; and in addition to these he had the large fortune brought him by his wife. While he was attorney-general Bacon was engaged professionally in several important cases. He was the king's agent against Peachum, a clergyman who was prosecuted for treason contained in a sermon never preached; and he exerted himself in getting the opinion of the judges before the trial, notwithstanding the unwillingness of Chief Justice Coke, and the illegality and injustice of such procedure. On the trial of the Earl and Countess of Somerset for the murder of Sir Thomas Overbury in the Tower, he distinguished himself by the perspicuity and eloquence with which he conducted the prosecution.

In 1617, Bacon was made keeper of the great seal, and on the 4th of January 1618, he was appointed lord high chancellor of England, and on July 11th of the same year, he was created Baron Verulam, and took his seat among the peers. Egerton, the old lord chancellor, had wished Bacon to be his successor, the influence of Buckingham was exerted on his behalf, and it appears that Bacon himself wrote to the king soliciting the place on the grounds of his superior fitness for the office, and the ready flexibility with which he would accommodate himself to the will and wishes of his sovereign. On putting the seals into his hands his majesty gave him three advices, first, "never to seal anything without mature deliberation; secondly, to give righteous judgments between parties with dispatch; and thirdly, not to extend the royal prerogative too far." Bacon entered on his high office with great pomp, and delivered a long and eloquent speech on the advices of the king, in presence of many of the nobility. Anxious to secure the 'golden opinions' of the profession, the new lord chancellor invited the judges to a dinner, and requested that, since it was not his intention to extend the power of the court of chancery beyond its ordinary limits, they would inform him if ever they were dissatisfied with his proceedings, in order to a mutual and satisfactory adjustment of matters. He introduced several reforms into his court. On the 19th of November 1619, he got the farming of the Alienation Office. Next year he was made Viscount St. Alban's. In the beginning of 1620 he kept his birthday with great state. Ben Jonson, the poet, celebrated his virtues, according to the fashion of the day, in some lines, which are part of a masque performed on the occasion. Bacon chose this favourable moment for the publication of his 'Organon,' the object of his life-long solicitude. At the height and maturity of his genius, when possessing all the highest honours which talent and learning could give him in his native land, we find this 'servant of posterity' committing to its slow but infallible tribunal a work which, in reference to science, has been almost universally pronounced—the judgment of reason and experience in this rare instance confirming the boastings of youth—the greatest birth of time. This work was the gradual formation of a creating spirit. It was wrought up and polished with the sedulous industry of an artist who labours for posterity. Besides the 'Partus Temporis Maximus,' the 'Cogitata et Visa,' and the 'Filium Labyrinthi,' works which were outlines and model-figures prepared at distant and different stages of this long-studied production, Bacon copied his work twelve times, revising, correcting, and altering it year by year before it was reduced to the form in which it was committed to the press.

The reception of the work was such as, in the nature of things, must always be given to a production of its class—mingled ridicule and admiration. The geniuses and professed wits laughed at it, and some of the chancellor's friends remonstrated with him on the subject. The pedantic king described it as like the peace of God,—it passeth all understanding. Bacon presented a copy to Sir Edward Coke, on which there is still to be seen, in the handwriting of this eminent lawyer, the following reproof to the author for going out of his profession, with an allusion to his character as a prerogative lawyer, and his corrupt administration of the court of chancery.

"Edw. Coke; ex dono authoris.

Auctori consilium.

Instaurare paras veterum documenta sophorum,
Instaura leges justiamque prius.—Oct. 1620."

Under a device, on the title-page, of a ship passing through the pillars of Hercules, Coke wrote in a clumsy attempt at wit—

"It deserveth not to be read in schools,
But to be freighted in the ship of fools."

And he was represented by more than one man of distinction in those times as "no great philosopher—a man rather of show than of depth, who wrote philosophy like a lord chancellor."

He was understood by some. Ben Jonson, after the author's death, described the book in terms of the highest praise. "Though by the most of superficial men who cannot get beyond the title of nominals, it is not penetrated nor understood, it really openeth all defects of learning whatsoever. My conceit of his person was never increased towards him by his place or honours. But I have and do reverence him for the greatness that was only proper in himself, and in that he seemed to me ever by his work one of the greatest men and most worthy of admiration that had been in many ages." The king, although he had expressed what doubtless he felt, the difficulty of understanding the work, wrote to Bacon stating that he agreed with him in many of his remarks, and assured him that he could not have "made choice of a subject more befitting his place and his universal and methodical knowledge." Sir Henry Wotton, on receiving three copies, expressed himself thus:—"Your lordship hath done a great and everliving benefit to all the children of nature, and to nature herself in her uppermost extent of latitude: who never before had so noble nor so true an interpreter; never so inward a secretary of her cabinet." On the continent the work was more highly honoured than at home, being esteemed by many of the most competent judges, as one of the most important accessions ever made to philosophy.

After this the glory of Bacon set for ever. He was ruined by his improvidence, which gave him a perpetual craving for money to supply the wants which it created, and at last undermined the principle of honour and of honesty. Various writers have glozed over the disgraceful truths which belong to this period of an extraordinary life, and have thus deprived the world of the warning and instruction which they afford. Shortly after Bacon's elevation to the woolsack, one Wrenham, against whom he had decided a case in chancery, complained to the king, and though, when inquired into, the circumstances turned out in Bacon's favour, the industry and pertinacity of this individual excited suspicions in several quarters of the integrity of the chancellor. The House of Commons appointed a committee of inquiry, which sat daily on the case, and made reports each day to the House on the evidence brought before them. The first case reported on was that of a poor gentleman of the name of Aubrey, who finding his suit in chancery going on with a ruinous slowness, was advised to quicken it by a gift to the lord chancellor. In his anxiety and distress he borrowed 100*l.* from a usurer; Lord Bacon received the money. Sir George Hastings and Mr. Jenkins took the bribe in to the lord chancellor at his lodgings in Gray's Inn, and on coming out again assured the poor and anxious suitor in his lordship's name of thankfulness and success. The case was decided against him. When the chancellor heard of the complaints of his victim, he sent for his friend Sir George Hastings, and entreated him, with many professions of affection and esteem, to stay the clamour of the poor man whom he had cheated. The evidence in the next case varied the form and deepened the colours of the lord chancellor's guilt. Mr. Egerton had several suits pending in chancery against Sir Rowland Egerton, and under the name of an expression of gratitude for past services, he presented the chancellor with 300*l.* The case went in his favour, until the opposite and losing party expressed his gratitude also to the judge in the shape of 400*l.*, when the superiority of four over three turned the scales of equity against him. On one of these occasions, when the decision was drawn out though not delivered, the influence of a well-bestowed bribe induced the chancellor to reverse his decree. The Lady Wharton, hearing that her suit was likely to go against her, was too clever and high-spirited a woman to be defeated without a struggle. She wrought a purse with her own hands, and having filled it with 100*l.*, waited upon Bacon at his apartments, and begged his acceptance of a purse of her own making. She gained her cause. Before the end of the proceedings the cases against the chancellor rose in number to at least twenty-four.

The discussion in the Commons issued in referring the whole of the cases to the Peers, the only authority competent to subject the lord chancellor to trial. The king told a deputation of the Commons to

proceed fearlessly whatever might be the consequences, and whoever might be implicated; but he felt exceedingly for the chancellor, received him with undiminished affection, and caused a short recess of parliament to give him time for his defence. The spirit of Bacon was crushed within him. His servants were undoubtedly the agents who sought out the victims of his corruption; and it is equally undoubted that their master was himself ruined by the rapacity and extravagance in which he permitted them to indulge. During the investigation of the charges, when Bacon one day entered his house, and his costly menials rose up and saluted him, he said bitterly, "Sit down, my masters, your rise has been my fall." He was great even in such circumstances, and the native dignity of his mind shone out even through the disgrace in which he had clothed himself. There is something inexpressibly touching in the contrition which he expressed in the general confession which he first sent to the lords appointed to try him. In compliance with their demand, Lord Bacon sent also a particular confession of each charge by itself, and when a deputation of the lords waited upon him to inquire if this paper was his own voluntary act, he replied, "It is my act—my hand—my heart. Oh, my lords, spare a broken reed." He was stripped of his offices, disqualified for public life, banished beyond the precincts of the court, subjected to a fine of 40,000*l.*, and to imprisonment in the Tower during the king's pleasure.

He was confined for a short time in the Tower, and then discharged. In the course of a few months he obtained a licence to come for a time within the verge of the court. And though his sentence was afterwards commuted by the king, his ruined fortunes were never repaired, and we have seldom felt the degradation into which Bacon had sunk himself so painfully as when reading the words of his pardon for all the frauds, deceits, impostures, bribes, corruptions, and other mal-practices of which he had been found guilty. He was summoned to attend parliament before he died; but the remainder of his days was spent chiefly in scientific pursuits, and the society of the friends whom adversity had left him. His name being high abroad, when the Marquis d'Effrat brought into England the princess Henrietta Maria, the wife of Charles I., he paid a visit to Bacon, and was received by his lordship, who was lying sick in bed, with the curtains drawn. "You resemble the angels (said that minister to him); we hear those beings continually talked of, we believe them superior to mankind, and we never have the consolation to see them." His lordship replied, "that if the charity of others compared him to an angel, his own infirmities told him he was a man." Bacon's works on natural history, his 'History of Henry VII.,' and some others, were published after his disgrace. Scientific pursuits were his consolation, and at last caused his death. The father of experimental philosophy was the martyr of an experiment. The retort which he was using burst, and parts of it struck his head and stomach. Fever and defluxion were the consequence. His last letter was written to the Earl of Arundel, in whose house at Highgate he expired on the 9th of April, 1626, in his sixty-sixth year. In his will he says, "My name and memory I leave to foreign nations, and to my own countrymen, after some time be passed over." Lord Bacon left no children.

The accomplishments of Lord Bacon were unrivalled in his day, and his character displayed the phenomenon of great originality combined with a most extensive range of acquirements. He was an orator, a lawyer and a statesman. In the philosophy of experiment and of observation he was pre-eminent. The metaphysical and the physical were both congenial to his genius; and although the taint of his immorality has induced many to doubt the extent and to depreciate the excellence of his knowledge and ability in every department, except his method of studying nature, an impartial and searching examination will fill us with admiration as we successively trace his steps in almost every branch of intellectual exertion.

The mind of Bacon was poetical: his works abound in imagery. But in writing in verse he makes free use of colloquialisms, which not seldom convey a ludicrous where he intended to present an impressive idea, and his poetry has consequently afforded abundant scope for the merriment of small wits and juvenile critics. Lord Bacon was certainly not a poet, but in his verses may be found many vigorous lines, and some passages of great beauty.

The merits of Bacon as an orator were, in the opinion of Ben Jonson, the most competent critic of his age, confirmed as it is by the testimony of Francis Osborne, and the effects of his eloquence, undoubtedly not equalled in his own time. Sir Walter Raleigh reckoned him the only man of his day who was equally eminent as a writer and a speaker. Jonson says that his speech was full of gravity and distinctness. The following passage, from Jonson, is remarkable:—"His hearers could not cough nor look aside from him without loss. He commanded when he spoke; and his judges were pleased and angry at his devotion. No man had their affection more in his power. The fear of every man that heard him was lest he should make an end." And after enumerating all the great orators of England from Sir Thomas More to Lord Chancellor Egerton, he declares that Bacon "hath filled up all numbers; and performed that in our own tongue which may be compared or preferred either to insolent Greece or haughty Rome . . . so that he may be named and stand as the mark and acme of our language."

The observations and experiments of Bacon in physical science,

viewed beside the results obtained by his immediate successors, do not appear to great advantage. It is only when viewed with reference to the general state of knowledge in his own times, that Bacon's recorded experiments and observations can be fairly estimated. His merits indeed would have been greater than those of any experimental philosopher, were his discoveries at all equal to the method of studying science which he taught.

In the first part of his great work on the 'Instauration of the Sciences,' Bacon proposed to make a survey of knowledge as it then existed, which was a necessary preliminary to the reform which he contemplated. In this work he has made a distribution of all knowledge under the three heads of Memory, Imagination, and Reason. This division has been occasionally adopted by subsequent writers, though it does not appear to have the recommendation either of exactness or utility. The 'Novum Organum,' which is divided into two books, is the second part of the 'Instauration.' In the first book of the 'Organum,' Bacon attempted to point out the states of mind which caused the existence of a false and fruitless philosophy. He saw causes of error in our common nature—in the peculiarities which mark the individual—in the mental use of the symbols of thought, and in those sectarian and party habits which the processes of association interweave with all the elements of the character, and harden into the schools and creeds which exert a despotic sway over successive generations. The influence of these mental states upon the interpreters of nature, Bacon called the worship of an idol; and the states themselves, in his fanciful nomenclature, are idols of different kinds: those which proceed from principles common to the species are idols of the tribe; those produced by the peculiar character of the individual are idols of the den; the commerce or intercourse of society by the use of words causes the worship of the idols of the forum; and the idols of the theatre are the creatures of the imaginary and visionary systems of philosophy which have appeared. Some causes of error are universal; the undue love of simplicity, and the spirit of system, are illusions influencing every mind, and therefore perpetually opposing the advancement of real knowledge. Other causes of error are peculiar. Some are disposed to mark the differences and others the resemblances of things, and the peculiar studies of a single mind are apt to warp its views in other regions of thought. Words influence thoughts, and the subtlety of the processes of the mind in using them is a source of error affecting the operations of the intellect and the communication of its results. The perverse influence of systems is illustrated fully by the history of philosophy. The undue reverence for antiquity, the authority of names, the pursuit of unattainable objects, the examination only of the rare, the extraordinary, and the great, together with superstition, which Bacon does not forget to enumerate, had long opposed the progress of all true knowledge.

In the first part of the 'Organum,' the true object of science is clearly pointed out by Bacon: "It is impossible," he says, "to advance with any profit in the race, when the point to be attained is not distinctly determined. In science, the true end is to enrich human life with new discoveries and wealth." ('Organum,' lib. i. aphorism 81.) In the second book Bacon proceeds to explain the method of studying nature, which he proposed, for the advancement of science. The first thing is to prepare, with great caution and care, a history of the phenomena to be explained, in all their modifications and varieties. Having brought together the facts, we must begin by considering what things they exclude from the number of possible causes, or forms as they are called in the language of Bacon. Negative instances, in which the supposed form is wanting ought to be collected. "It may perhaps," says Bacon, "be competent to angels or superior intelligences to determine the form or essence directly by affirmations from the first consideration of the subject. But it is certainly beyond the power of man, to whom it is only given at first to proceed by negatives, and in the last place, to end in an affirmation after the exclusion of everything else."

The observations and experiments of the natural philosopher—the facts which he is to record in his inductive history—are witnesses whose evidence, and the weight due to whose testimonies, vary in the same way as in the evidences which form the grounds of moral investigations. The facts, or instances, as Bacon calls them, vary in clearness, in authenticity, applicability, &c. Bacon enumerates twenty-seven different kinds of instances, and estimates the weight due to each from the peculiar circumstances which constitute their value or worthlessness as means of discovery and aids to investigation; but it is impossible, in this outline, to enter into a description of their nature and importance. Of these twenty-seven instances, fifteen are enumerated to assist the understanding in estimating the value and forming a right judgment of different facts; five correct the fallacies of the senses and instruct them in their observations; and the remaining seven direct the hands "in raising the superstructure of art on the foundation of science." This last division includes the use of instruments in aiding the senses, in subjecting objects to alteration for the purpose of observing them better, and in the production of that alliance of knowledge and power which has, in our day, crowded every part of civilized life with the most useful inventions.

Such were the principles which Bacon shaped into rules for the conduct of experimental inquiries, when he was almost without an example of success to confirm his confidence and encourage his efforts.

In the words of Professor Playfair, "the power and compass of the mind which could form such a plan beforehand, and trace not merely the outline but many of the most minute ramifications of sciences which did not yet exist, must be an object of admiration to all succeeding ages. The great merit of Bacon undoubtedly consists in the systematic method which he laid down for prosecuting philosophical investigation; and his services in this department cannot easily be overrated. "Previous to the publication of the 'Novum Organum' of Bacon," observes Sir John Herschell, "natural philosophy, in any legitimate and extensive sense of the word, could hardly be said to exist;" and even at the present day, those especially who busy themselves with physical pursuits would often do well to recur to the severe and rigorous principles of the 'Organum.'

The greater part of Bacon's works were written in English, but some were written in Latin, and others were translated into that language. His 'Felicities of Queen Elizabeth's Reign' was first written in English, and then revised, corrected, and turned into Latin. His work on the 'Advancement of Learning' was partly written in English and partly in Latin, and he caused the first part written in English to be translated into Latin. His 'Cogitata et Visa' was written in Latin. 'Of the Wisdom of the Ancients,' and the 'Novum Organum,' were written and published in Latin, and several translations of them have appeared. An 'Account of Lord Bacon's Novum Organum' was published under the superintendence of the Society for the Diffusion of Useful Knowledge, and new translations of it have been published within the last few years by Basil Montague and J. Devey, the latter for Bohn's 'Scientific Library.' The best edition of his works is the last published, in royal 8vo, by Basil Montague, Esq., and completed in 1831.

BACON, JOHN, was born on the 24th of November 1740, at Southwark, in Surrey, where his father carried on the trade of a cloth-worker. He showed at a very early age a taste for drawing, and was apprenticed when fourteen to Mr. Cripe, of Bow Churchyard, a porcelain manufacturer, where he learned the art of painting on china, and also of making those little ornamental figures in that material which are still frequently seen on mantelpieces. So evident was his talent, that in the second year of his apprenticeship he was entrusted with the formation of all the models for the manufactory; and it is a still higher praise, that at this early age he contributed essentially to the support of his parents, then in reduced circumstances. At that time it was the practice of sculptors to send their clay models, for the purpose of being burnt, to the pottery where Bacon was employed, and his attention being attracted by these works, he set himself to acquire a knowledge of the sculptor's art, and from this time his leisure was zealously devoted to his new pursuit. In 1758, being then eighteen, he ventured to send a small figure of Peace to the Society for the Encouragement of Arts; it was favourably received, and he was rewarded with a premium of ten guineas. The first premiums of this institution were adjudged to him on nine different occasions.

The discovery of the art of making statues in artificial stone (cement) has been ascribed to Bacon, perhaps incoorrectly; but he is unquestionably entitled to the praise of having facilitated the process of that art, and of rendering it popular. He laboured during a considerable time in Coade's manufactory at Lambeth, where every species of architectural and monumental ornaments, as well as statues, were made in stone, and his skill and exertions were of essential service to the establishment. On the institution of the Royal Academy in 1768, he entered himself as a student, and the next year gained the first gold medal for sculpture which was awarded by that society. In 1770 he was elected an associate of the Royal Academy. He exhibited about this time a statue of Mars, which brought him a great accession of reputation, and procured him the personal notice of the Archbishop of York, who commissioned him to execute a bust of George III. By this prelate Bacon was introduced to the king, who sat to him, and was personally impressed by the general simplicity and propriety of his manners. Bacon subsequently took care to maintain the advantage which he had thus obtained, and during his whole professional career he succeeded in securing the king's favour against all competition.

About this time Bacon married, and removed from the small and inconvenient apartments which he had previously occupied to a spacious house in Newman-street, the premises, it is said, having been fitted up with studies, workshops, &c., without his knowledge, by the liberality of a friend, who left the affair of payment to his own convenience. Every circumstance now tended to his prosperity: he was employed by public bodies, as well as by various private individuals, and his profits were greatly augmented by the use of an ingenious instrument of his own invention, which facilitated the process of copying the clay model in marble, and by which he was enabled to execute his figures in little more than half the time previously required. In 1777 he was engaged to erect a monument for Guy's Hospital, Southwark, in honour of its founder. The merit of this work procured him a commission for the monument of the Earl of Chatham, now in Guildhall. This performance furnishes evidence of Bacon's abilities, but it exhibits at the same time the prevalent defects of his style. Lord Chatham's attitude is oratorical and commanding, and the allegory of Britannia receiving from Industry and Commerce the contributions of the four quarters of the globe is as conspicuously

expressed as such allegories usually are. There is a richness in the whole by which the eye is attracted, but the flowing and redundant lines which conduce to that impression are at variance with the simple and severe principles of the highest style of sculpture. Bacon had the good sense to disclaim any pretensions to that knowledge of the antique which he was accused of wanting, asserting that in the study of living nature he sought for excellence where the ancients had found it. But there was another deficiency, which, though he would perhaps more resent on being charged with, and which prevented him from taking a place in the foremost ranks of his art, was no hindrance to that which he perhaps valued more, immediate success and pecuniary profit. His lack of imagination and his want of the refined perception of beauty were indeed among the chief causes of his extraordinary professional success. Bacon's power lay in the plain realities of life, and whatever illustrations he employed were of the most popular character, and understood at once by the multitude. "His Generosity," as one of his biographers has amusingly expressed it, "has her pelican; his Sensibility her sensitive plant, Commerce her compass, and Manufacture her spinning-jenny." Symbols like these lay no tax either on the learning or the imagination of the spectator, and thus it was that Bacon's works became universally popular, while the productions of men of higher qualifications were comparatively neglected.

In 1780 Bacon received commissions for the monument to Lord Halifax in Westminster Abbey; the statue of Blackstone for All Souls' College, Oxford; that of Henry VI. for the Ante-Chapel at Eton; and for the ornamental groups in front of Somerset House. The recumbent figure of 'Thames' in the court-yard of that edifice is also by him. When it was proposed by Government to erect a monument to the Earl of Chatham in Westminster Abbey, the various artists were invited by the committee of taste to send in designs. The power of deciding on this competition, and of nominating the artist to be employed, was at that time conceded to the Royal Academy; but Bacon forestalled the decision by availing himself of his private influence with the king, and having procured an audience for the purpose of showing his model, obtained his Majesty's commands to make the monument. His academic brethren were deeply indignant at this manoeuvre, but they had too much policy to express their resentment. Subsequently, Bacon, in the true spirit of a trading speculator, actually made a proffer to Government to make all the national monuments at a certain per-centage below the parliamentary price. His proposal was rejected, but neither with the promptitude nor the contempt which was due to it. Bacon's rank as an artist has been steadily sinking; his professional standing was never very high. But his character, in the private relations of life, was said to be blameless; and although it is admitted that he was somewhat penurious in the management of his household, it is also said that he sometimes gave large sums to public charities. He was eminently loyal, and during the threat of French invasion he had his workmen armed and drilled for military service, and he published some tracts with the view of preventing the spread of revolutionary principles.

Among the principal works executed by Bacon, may be reckoned the monument to the Earl of Chatham in Guildhall, the monument to Lord Halifax in Westminster Abbey, the statue of Blackstone at All Souls' College, Oxford, that of Henry VI. in the Ante-Chapel at Eton, and those of Howard and Johnson in St. Paul's Cathedral. The two last especially are good examples of the sculptor's power and of his weakness.

Bacon died on the 4th of August 1799. He had been twice married, and left two sons and three daughters by his first wife; by his second, three sons. The works which he left incomplete he directed to be finished by his second son, John Bacon. His wealth, amounting to 60,000*l.*, he divided equally among his children. He was buried in Whitfield's Chapel, Tottenham Court Road, London; and the following inscription, by himself, was placed on a plain tablet over his grave:—"What I was as an artist seemed to me of some importance while I lived; but what I really was as a believer in Jesus Christ is the only thing of importance to me now."

(Cecil, *Memoirs of Bacon*; Allan Cunningham, *British Painters, Sculptors, &c.* vol. iii.)

BADALOCCHIO, SISTO, an Italian painter and engraver, born at Parma towards the close of the 16th century, was the pupil and for some time the assistant of Annibal Caracci at Rome. He was highly valued by Annibal as a draughtsman, who confessed that he surpassed himself; but in painting he was much inferior to Guido or Domenichino. His engravings are not numerous; the most celebrated are the so-called 'Bible of Raphael,' which he executed in company with Lanfranc, and dedicated to Annibal Caracci; and the six prints from Correggio's cupola at Parma. Of his paintings the best was 'Galatea,' in the Verospi Palace at Rome; a 'San Francesco' at the Capucins of Parma, was also one of his best works; but like his friend Lanfranc, says Lanzi, he always did less than he was capable of doing. The date of his death is not known.

(Lanzi, *Storia Pittorica, &c.*; Malvasia, *Felsina Pittrice*; Bartsch, *Le Peintre-Graveur.*)

BAFFIN, WILLIAM, an enterprising English navigator of the 17th century. Of his early life nothing is known. In 1612 he sailed in the fourth voyage of Hall on discovery to the north-westward, of which the only account we have was written by him. It is remark-

able as being the first voyage on record in which a method is laid down (as then practised by Baffin) for determining the longitude at sea by observations of the heavenly bodies. In 1613 he went on a voyage to the coast of Greenland, in the narrative of which he notices the extraordinary refraction of the atmosphere, the quantity of which he calculated to amount to 26' as a maximum when a heavenly body is on the horizon. In 1615 he was appointed mate and associate to Robert Bylot on another voyage of discovery, for the account of which we are also indebted to Baffin; and in 1616 he again accompanied Bylot as pilot in an expedition which discovered and penetrated to the head of that extensive bay which bears his name. Of this voyage Captain Ross observes that he found all the positions and descriptions of this able seaman remarkably accurate; and the accuracy of Baffin has been attested with equal distinctness by other eminent navigators. In 1618 Baffin was mate on a voyage from Surat to Mocha; and in 1621 he engaged in an English expedition acting in concert with the Persians to drive the Portuguese out of the Persian Gulf, in the course of which he was killed at the siege of Kismia, a small fort near Ormuz, while employed in measuring the distance from the place, for the purpose of cannonading it. (Purchas, *Pilgrims.*)

BAGGESEN, JENS, a writer of considerable distinction both in Danish and German literature, was born at Corsoer in the island of Zealand, February 15, 1764, and was educated at the University of Copenhagen. From his earliest youth he displayed unusual liveliness of imagination, of which, together with satiric humour, his first production, at the age of twenty, his 'Comic Tales,' gave evidence, and obtained a most favourable reception from the public. Yet he himself says that he had no taste for the comic; that in writing his tales he consulted the taste of the public far more than his own, and that he published them for the purpose of paying off his father's debts and assisting the family: from which it would appear that they were left in embarrassed circumstances. His course through life was very unsettled, and he experienced many vicissitudes, arising in a great measure from the want of having a fixed pursuit. The prince of Holstein-Augustenburg bestowed on him a small pension. In 1789, being then in delicate health, he accompanied his countryman the young Count Molthe, who was also an invalid, in a visit to Switzerland, returning home through France and Germany. Of this journey he has given a full narrative, or rather picture, in his 'Labyrinth,' one of the most interesting of his works, it being, as he himself calls it, his 'Digtervandring,' or 'Wanderings of a Poet,' in which he records his varied feelings, opinions, and contemplations, and portrays his own character. In this work he refers at length to his acquaintance with Sophia Haller, the granddaughter of the poet, whom he married at Berne in March 1790, after which event he immediately returned to Denmark. He soon set out again, and after leaving his wife with her family at Berne, visited Paris, where he became acquainted with many of the public characters of the day. On his second return to Copenhagen in 1796 he obtained a professorship at the university, but found it too irksome for his disposition, and as change of climate was thought necessary for his wife's health, he set out the following year for Germany, but lost his wife at Kiel. After this bereavement he proceeded to Switzerland, taking with him his two young children; and in 1798 again visited Paris, where he married Fanny Reibaz. During his stay in France, which was prolonged till 1810, he composed his chief German poems, one of which, published in 1806, the 'Parthenaie, oder Alpenreise,' an epic idyll, in twelve cantos, after the manner of Voss's 'Luise,' and, like that, written in hexameters, was most favourably received. His residence at Paris, during a part of which he had been in prison for debt, was terminated in consequence of his being appointed professor of Danish literature at the University of Kiel. He again returned in 1814 to Copenhagen, where he was most warmly received, yet soon embroiled himself in a violent feud with Oehlenschläger, whom he opposed as the leader of the romantic party in poetry. This led him again to take up his abode at Paris, making occasional visits to Copenhagen. In 1825 he went to Carlsbad for the benefit of the waters, and was returning thence to Copenhagen, when he died at Hamburg, October 3, 1826. After his death, but in the same year, appeared his 'Adam and Eve,' a most extraordinary subject for a 'humorous epic'; not less so for being chosen by one who had told the public that he had naturally no relish for the comic strain, in which he nevertheless indulged when on the verge of the grave. The warm-heartedness and enthusiasm of his youth must have been exchanged for a very different temper of mind before he could have brought himself even to the contemplation of such treatment of such a subject, and his rapturous admiration of Klopstock must have evaporated altogether. He is said to have left in manuscript a poem of similar and even stronger character, of which Faust was the hero. His correspondence with Reinhold and Jacobi, in 2 vols. 8vo, was published by his sons in 1831; and a complete edition, in 12 volumes, of his 'Danske Værker,' comprising all his Danish poems and other writings in that language, his translation of Holberg's 'Niels Klim' inclusive, was published by his sons and C. J. Boye, 1827-32. A well-executed portrait of him is prefixed to it.

BAGLIONE, GIOVANNI, a Roman fresco- and oil-painter of the 17th century, now better known for his 'Lives' of his contemporaries than for his paintings, though in his time he enjoyed the highest

patronage. He was born at Rome about 1573, and was for a short time the pupil of a Florentine painter, Francesco Morelli. He attracted the notice of the popes Sixtus V. and Paul V., the latter of whom created Baglione a Cavalier del Abito di Cristo. In 1618 he was elected Principe of the Academy of St. Luke. The date of his death is not known: he was still living in 1642. He executed a great many works in Rome, some at Naples, and some at Mantua; but he painted very few easel pictures, whence his works are rarely seen in collections; he excelled in colour, and in light and shade. One of his best works is the 'Resurrection of Tabitha,' in St. Peter's at Rome.

His book of Memoirs, of which he has written 81, is composed in an extremely simple style, without any attempt at criticism; and if he ever ventures upon a qualifying remark, it is sure to be one of commendation. G. B. Passari published an edition of it at Naples in 1733, with the addition of the 'Life of Salvator Rosa:' there is also a memoir of Baglione, which contains a long list of his works. The following is the title of the book—'Le Vite de' Pittori, Scultori, Architetti, ed Intagliatori, dal Pontificato di Gregorio XIII. nel 1572 fino a' tempi di Papa Urbano VIII. nel 1642.' The editio princeps was published at Rome in 1642, and, according to Orlandi, a second appeared in 1649.

BAGLIONI, an historical family of Perugia in Italy, which in the middle ages produced many distinguished warriors, several of whom exercised supreme power over their native town. Perugia was in those times one of the most populous and important cities of central Italy, and governed itself as a municipal community, under the nominal protection first of the emperors and afterwards of the popes. Like most other Italian cities it was distracted by two parties, that of the nobles and that of the people. The Baglioni belonged to the nobles. We find in the 12th century Ludovico Baglioni appointed Imperial Vicar of Perugia by the emperor Frederic I. (Barbarossa), who in his diploma styles him his relative, as being descended, like himself, from the ducal house of Suabia. After the fall of the Suabian dynasty the nobles and the popular party had frequent conflicts with alternate success. In the year 1393 a general outbreak took place, when Pandolfo and Pellino Baglioni, with seventy other gentlemen, were killed in a fight in the streets, and their adherents being driven away, the popular party remained in possession of the town until 1416, when Braccio Fortebracci, as the head of the nobles, re-entered the town by force, and was proclaimed Lord of Perugia. Malatesta Baglioni, son of Pandolfo, was one of the foremost followers of Braccio, whose niece he married. One of his sons, named Braccio Baglioni, was appointed general of the Holy See by Pope Callixtus III.: he defeated Francesco Sforza near Lodi in 1453, was made Lord of Spello by Sixtus IV., and died in 1474. His brother Ridolfo left a son called Gian Paolo Baglioni, a condottiere, or captain of an independent band of soldiers, who became conspicuous in the Italian wars of the beginning of the 16th century. Availing himself of the civil dissensions of his native town to obtain supreme power over it, he formed an alliance with some neighbouring rulers, and with Cesare Borgia in his wars of the Romagna. But Baglioni was soon glad to leave Perugia to Borgia, and to separate from that unscrupulous chief. After a time he resumed his old profession of condottiere, and in that capacity he served the Venetians for several years in the war of the League of Cambrai. He was taken prisoner by the Spaniards in 1513, but being released he returned to Perugia, where he resumed his former ascendancy. In 1520 Leo X., hearing repeated complaints of Baglioni's conduct, requested him to come to Rome, under pretence of consulting with him about weighty state matters; but on his arrival at Rome he was arrested, put to the torture, and speedily condemned and beheaded. Perugia was then taken possession of by the pope. After Leo's death, Malatesta and Orazio Baglioni, the sons of Gian Paolo, recovered possession of Perugia. Malatesta was saluted by the citizens as 'Pater Patrie,' and a medal was struck in honour of him. Orazio afterwards obtained the command of the mercenary corps called the Black Bands in the service of France, and followed Marshal Lautrec in his expedition against Naples in 1523, in which he was killed. His brother Malatesta remained at the head of the government of Perugia till September 1529, when he was obliged to surrender it to the papal and imperial allied arms. At the same time the Florentines chose him to be their captain-general against the same enemies; but Baglioni, either through incapacity, or treachery, or both, failed to defend Florence as he might, and in August 1530 was dismissed from his command. He refused however to give it up, and even turned the guns of one of the ramparts against the city. Florence, worn out by famine and disease, was obliged to capitulate and submit to the rule of the Medici. Baglioni returned to Perugia, where he died in December 1531. He left a son, Ridolfo, who became general of the troops of Cosmo I., grand duke of Tuscany.

Gentile Baglioni, grandson of Braccio above mentioned, was made Bishop of Orvieto in 1505, but afterwards, in consequence of his three brothers dying without legitimate issue, he renounced his dignity, married Giulia Vitelli, and was for a time governor of Perugia for the pope. He was driven away by his relative Orazio Baglioni, who caused him to be put to death in 1527, with two of his nephews. The various branches of the Baglioni family were in constant enmity against one another. Gentile left two infant sons: one, Adrian, served in the papal troops, and died in 1574; the other, Astorre Baglioni, is better known in history for his military reputation and his tragical

end. Astorre was brought up under the care of his uncle Alessandro Vitelli, a distinguished general of his age, whom he followed to the Hungarian wars against the Turks. He afterwards served Charles V., and he rose high in the favour of Pope Paul III., who restored to him his paternal estates. The republic of Venice intrusted him with several important situations, and being governor of Famagosta in the island of Cyprus when the Turks besieged the place in 1570, he was after a long and brave defence obliged to capitulate, in August 1571, on condition of being sent to Venice with his garrison. But Mustapha Pasha, disregarding the capitulation, caused Baglioni and the other Venetian officers to be beheaded, except Bragadino, who was flayed alive.

BAGLIVI, GEORGE, a distinguished Italian physician, was born at Ragusa in September 1669. He prosecuted his studies at the universities of Salerno, Padua, and Bologna, and then visited almost all the hospitals of Italy, Dalmatia, &c. He settled at Rome in 1692, where he had the advantage of the instruction and friendship of the famous Malpighi. Soon afterwards, although yet very young, he was appointed by Pope Clement XI. to be professor of anatomy at the college of La Sapienza, called the Roman Archlyceum.

In the address prefixed to his 'Specimen Quatuor Librorum de Fibra motrice,' Baglivi states that after the perusal of many works, he at last confined his attention to the writings of Hippocrates, which he learnt almost by heart; and in his practice endeavoured to limit his attention to a careful observation of the phenomena of disease, and to found his rules of treatment upon sound principles, dismissing the theories which then held the medical profession in a state of slavish subjection to the authority of names. Such was his independence of mind, that, notwithstanding his respect for Hippocrates, he differed from him and all previous writers in discarding the doctrines of the humoral pathology, or that theory which ascribed all diseases to some altered state of the fluids of the body. He, on the other hand, not only from his own observation and reflection, but from learning the mode of treating diseases in India and other parts of the East, the success of which was entirely owing to an action on the solids primarily, maintained that the solids were, in most cases, first affected, and the fluids, when affected at all, only secondarily. These opinions he published in 1696, and strengthened them by further observations and experience, which he made known in successive editions of his work, of which six appeared before 1704. It must be allowed that the ancient doctrine had been impugned in various works published in England by Willis and by Glisson, and in France by Vieussens, not long before Baglivi's time, but Baglivi brought to the consideration of the subject more extended views, and more accurate principles. These are detailed chiefly in his 'Specimen Quatuor Librorum de Fibra motrice.' Valuable and just as are many observations and conclusions in this treatise, he greatly erred in ascribing (lib. i., cap. v.) the contractions and relaxations of the muscular fibres to certain imaginary contractions and dilatations of the fibres of the dura mater.

His opinion, that the fluids are affected secondarily in consequence of a previous affection of the solids, has been gradually gaining ground since the time it was first promulgated. It received important additions from Hoffmann, in Germany (Hoffmann's 'Medicina Rationalis Systematica,' vol. iii., l. i., chap. iv.), and Cullen in England ('First Lines of the Practice of Physic,' Preface, et passim). Still the most candid pathologists of the present time admit that in a few cases, perhaps, the fluids are primarily affected, yet the opposite doctrine may be considered as the current hypothesis of the present day, and Baglivi the father of the modern system of solidism.

Baglivi died at Rome in 1706, at the early age of 38, worn out by his arduous exertions. The first complete edition of his works is that of Lyon, 1704, entitled 'Opera omnia Medico-practica et Anatomica,' 4to, which has been several times reprinted. Baglivi was a Fellow of the Royal Society of London.

BAILLIE, ROBERT, was born in Glasgow, April 30, 1602. He was the son of Thomas Baillie, a citizen of Glasgow, and was educated first at the grammar-school and afterwards at the University of Glasgow, at which he was entered a student in March 1617. He took his degree of M.A. in 1620; probably in 1623 or 1624 he entered into holy orders; in August 1625 he was admitted to the office of one of the masters or regents (as the professors were then styled) of the college; and this situation he held till the year 1631, when he was presented by the Earl of Eglinton to the parish church of Kilwinning in Ayrshire. At this time Baillie's sentiments on the subject of church government were extremely moderate; his ordination had been episcopal, and he was attached on principle, as well as by education and habit, to that form of polity, which was indeed at this time the established ecclesiastical system in Scotland. But when Charles I. made his attempt in 1636 and 1637 to impose the new service-book and canons upon the Scottish church, Baillie was induced to attend a meeting of the Supplicants, as the opponents of the obnoxious measures called themselves, which was held at Edinburgh on the 18th of October, 1637; and this proved the turning point of his life. His opposition to the new service-book was more on account of its doctrines

than the forms it prescribed. His speech at this meeting so delighted his audience that he was urged to send it to the press, and from this time he took his place as one of the chief managers and leaders of the Presbyterian and anti-court party.

At the celebrated General Assembly which met at Glasgow on the 21st of November, 1638, Baillie, who was one of the members for the presbytery of Irvine, manifested so much of his original moderation, that he stood alone in refusing to concur in the vote declaring episcopacy to have been always abjured by the Scottish Church: he proposed that it should be declared to be "removed now, but never before abjured." The prevailing party however were aware of his value, and he was soon entirely gained over. When arms were taken up he appeared in the camp at Duns Law, in the beginning of June 1639, in quality of preacher to a division of the troops. In the course of the same month however a pacification was arranged at Berwick. In April 1640 Baillie published what may be considered to have been an extension of his speech at the meeting of Supplicants, in a large quarto pamphlet at Edinburgh, under the title of '*Ἀποκατάκρισις*: the *Canterburians' Self-Conviction*; or, *An Evident Demonstration of the Awful Arminianism, Popery, and Tyranny of that Faction, by their own Confessions*,' &c. In the following October, when the Scotch had again taken arms, he proceeded, on the invitation of the earls of Rothes, Montrose, and Argyle, to the council of war at Newcastle, taking with him a number of copies of his book; and here he was nominated one of the four clerical commissioners who were deputed with nine laymen to proceed to London, under the protection of the great seal, to negotiate a treaty with the king. He reached London on the 16th of November, and remained there till the beginning of June 1641, having during his residence witnessed the trial of Strafford and other remarkable occurrences, of which his letters contain very full accounts. In one of his letters written during Strafford's trial he writes, in a somewhat sanguine as well as sanguinary strain, "When we get his head, then all things will run on smooth." In June 1642 Baillie was appointed joint professor of divinity in the university of Glasgow, but immediately after this he was again dispatched to England as one of the five clerical commissioners from the General Assembly to the Westminster Assembly of Divines. He reached London on the 18th of November, and he did not leave till the 6th of January 1645. He was sent back again before the end of March, when, as he was proceeding by sea, the ship was driven towards the coast of Holland, and forced to run up the Maas, which gave Baillie an opportunity of spending a few days at Middelburg and Rotterdam. He remained in London on this his last visit till December 1646, employing every moment that was not taken up in attending the Assembly of Divines in preaching and in writing sermons, pamphlets, and letters to his friends in Scotland and elsewhere. He now resumed his duties as professor of divinity, continuing also however to take an active part in public proceedings. After the execution of the king he was one of two clergymen sent over to the Hague in March 1649, with the commissioners of the Scottish estates (or parliament), to enter into negotiations with Charles II. Upon this mission he was absent till July, and during that interval he composed and published at Delft an answer to a pamphlet against Presbyterianism by Bishop Bramhall. When Cromwell advanced upon Glasgow in October 1650, after the battle of Dunbar, Baillie fled to the Isle of Cumray with Lady Montgomery, but left, he tells us, all his family and goods to Cromwell's courtesy, "which," he adds, "indeed was great; for he took such a course with his soldiers that they did less displeasure at Glasgow nor [than] if they had been at London, though Mr. Zachary Boyd railed on them all to their very face in the High Church." Under the new government he was in January 1651 appointed first professor of divinity on the removal of his colleague to a chair at Edinburgh; and shortly after the restoration he was, in January 1661, promoted to the office of principal of the university. About the end of August 1662 he died, in the sixty-first year of his age. He had been twice married, and had eight children, of whom only one was by his second wife.

Of Baillie's works the most important, besides those already mentioned, are his '*Dissuasive from the Errors of the Time*,' 4to, London, 1645; his '*Anabaptism, the True Fountain of Independency, Brownism, Antinomy, Familism*,' &c. (a Second Part of the *Dissuasive*), 4to, London, 1647; his '*Appendix Practica ad Joannis Buxtorffii Epitomen Grammaticae Hebraeae*,' 8vo, Edinburgh, 1653; and his '*Operis Historici et Chronologici Libri Duo*,' folio, Amsterdam, 1663, and Basil, 1669. He also published several sermons and other short tracts. But of all the produce of his pen by far the most interesting part consists of his '*Letters*,' written to various friends, and especially to his relation, the Rev. Mr. William Spang, minister of the Scottish church at Campvere, and afterwards of the English congregation at Middelburg in Zealand, which extend, with inconsiderable interruptions, from 1637 to within a few months of the writer's death, and are among the most valuable memorials of that important period of our national history. An edition of the '*Letters*' appeared in Edinburgh in 1775, but this was only a selection, and not carefully edited. A complete edition was produced under the care of David Laing, Esq., in 3 vols. crown 8vo, Edinburgh, 1841-42, with annotations, a life of Baillie (to which we have been indebted for the materials of this notice), and other illustrative matter.

BAILLIE, JOANNA, was born at the manse at Bothwell, near
STOQ. DIV. VOL. I.

Glasgow, in 1762. She was the sister of Dr. Matthew Baillie, the subject of the following article. The history of her uneventful life is soon told. The daughter of a Scottish clergyman and professor of divinity, and of a mother in whose family superior intelligence seemed a common property, Joanna, while trained in the strict manner usual in a Scottish manse, not only received an excellent education, but from her childhood was brought into constant intercourse with people likely to call into activity her own mental gifts. Her career through life was quiet, unobtrusive, domestic; her tastes were all studious; her disposition was gentle, kindly, and benevolent. At an early period she removed to London, where her brother, Dr. Baillie, was settled as a physician. After a time she with her sister Agnes took up her residence at Hampstead, which, while from its proximity to the metropolis it allowed her to enjoy ready intercourse with the many friends her literary fame drew about her, insured her at the same time a certain amount of retirement; and here the rest of her lengthened life was spent. She was known and esteemed by the most eminent of her contemporaries of more than two generations, and for very many years even from the New World visitors, attracted by the charm of her poetry, came to obtain her acquaintance and to listen to her conversation. Those who visited her out of admiration returned adding to that sentiment feelings of affection and respect. She died at Hampstead on the 23rd of February, 1851, in her eighty-ninth year, having retained her faculties to the last.

Though Joanna Baillie possessed in a large measure that keen and sensitive interest in all that developed the feelings or touched the destinies of others, and that sensibility and sympathy which are the special heritage of dramatic poets, yet these sentiments had in her instance more of pensiveness and of speculativeness than of fire, and made her seek and find events in her own thoughts rather than in action and experiment. Adventure may be, and has often been, the school of poetry for men; but a woman, and especially one of Joanna Baillie's feminine and modest disposition, must invoke the muse with a serene and more gentle worship. A close and penetrating observer, and gifted with no common genius, yet not favoured with the highest, nor endowed with the inspiration of 'many-mindedness,' which makes poetry of the first order bear to philosophy the same relation that intuition bears to calculation, Joanna Baillie early in life conceived a literary project based on a principle essentially erroneous, but which led to the production of her greatest works, the celebrated '*Plays on the Passions*.' The principle on which all these plays were constructed was to select some one of the more powerful passions that agitate mankind, and to exhibit it in full action, by making the hero of the drama completely subjected to it, and by evolving out of the promptings to which he is represented as paying undivided and uninterrupted allegiance, every incident and situation. Admitting fully the noble poetry with which these plays are filled, and even the deep interest of many positions and events, it is evident that such characters must have a constrained, morbid, and unreal aspect; since in life, as in the dramatic creations of the highest genius, we constantly see that the dominant passion is turned aside or suspended by, it may be transient, but for the time irresistible, counter-thoughts or the force of circumstances; and this is a main reason why her plays have only achieved a partial and temporary success on the stage. Yet the one master passion is often admirably exhibited—laid bare in its most secret workings—subjected to a keen and searching analysis.

It was in 1798 that Miss Baillie published the first volume of her '*Plays on the Passions*.' She was then thirty-six years old. As a book the production met with great success; and a second edition was called for in a few months. In 1802 she published a second volume. Two years later, appeared her '*Miscellaneous Plays*.' Among these was the '*Family Legend*,' a tragedy, which she used to term "her Highland play." It was acted for the first time at Edinburgh, in January 1810, with brilliant, but not durable, success. The prologue was written by Sir Walter Scott, who interested himself most ardently in its production on the stage; and Mrs. Siddons sustained the principal female part. In 1812 appeared the third volume of the '*Plays on the Passions*.' In 1836 she published three more volumes of dramatic poetry. Previously to this, her tragedy of '*De Montfort*,' perhaps the finest of her productions, had been brought out in London; and for eleven nights John Kemble sustained the character of the hero. Again, in 1821, this play was put on the stage for Edmund Kean to perform the same part. The '*Separation*,' one of the *Miscellaneous plays*, and '*Henriquez*,' one of those on the passions, and both tragedies, have also been acted.

Notwithstanding the originality of conception of Joanna Baillie's great dramatic poems, and the fire and inspiration with which passages in all of them are composed, no perfect idea could be gathered of the writer's powers from these performances alone. Her fugitive pieces, her ballads, her occasional lines, and her songs, taken together, afford the true measure of Joanna's powers, and the fairest proof of her versatile genius. They are bright, fresh, simple, and genuine; often humorous; sometimes highly pathetic; occasionally homely; never low, common-place, or gross. We must add that, along with all these natural gifts of the true poet, she possessed those acquired advantages, which nothing but severe and constant labour can bestow. Among her lighter effusions, the '*Woo'd and Married and a*,' '*The Kitten*,' '*To a Child*,' '*The Weary pund o' Tow*,' and '*Tam o' the*

Linn,' are singularly illustrative of her style, so varied, yet always so simple and so arch.

In the year of her death, her works, which began to appear before the close of the 18th century, being still young in public esteem, she herself superintended their collective publication, prefixing a vigorous and able introductory discourse. Her works have been reprinted since her death in a single volume with a brief memoir.

BAILLIE, MATTHEW, an eminent anatomist and physician, was born on the 27th of October, 1761, at the manse (or parsonage) of Shotts, in Lanarkshire, Scotland. His father was the Rev. James Baillie, at that time clergyman of the parish of Shotts, and his mother, Dorothea Hunter, sister of the celebrated anatomists William and John Hunter. Soon after his birth his father was removed to the charge of the parish of Bothwell, and subsequently to that of Hamilton, and after being some time there he was elected professor of divinity in the University of Glasgow. Matthew's education was carried on at the school at Hamilton, and at Glasgow University.

Though originally inclined to adopt his father's profession, or to enter the bar, his uncle, Dr. William Hunter, then the most eminent teacher of anatomy in London, held out such inducements as determined him to choose the medical profession. Measures were taken at Glasgow to procure for him an exhibition to Balliol College, Oxford, which is in the gift of the professors of the University of Glasgow. The death of his father about this time, and the consequent diminution of the family income, rendered such assistance very desirable. It was at last obtained, and in March 1779 he intimated by letter to his uncle, that he was ready to proceed to Oxford. This letter, asking advice as to his studies and conduct on his first entrance into life, displays good sense, correct principle, and a degree of tender feeling towards his mother and sisters, which he continued to exhibit throughout the whole of his and their lives.

On his way to Oxford he visited London, and for the first time saw his distinguished uncle, from whom he received directions respecting his studies, which he prosecuted for an entire year at Oxford. But subsequently he visited the university only at term time, spending the intervening periods in London with his uncles, whose lectures he attended, as well as those of other eminent teachers in other departments of medicine. Two years after he had commenced his studies in London, he became a teacher in his uncle's anatomical theatre in Great Windmill-street, in the capacity of demonstrator. About a year after this time Dr. William Hunter died, and bequeathed to his nephew the use of his splendid museum, his anatomical theatre and house in Great Windmill-street, as well as a small estate in Scotland (which Baillie generously gave up to his uncle John Hunter) and an annuity of 100*l.* a year. Dr. Hunter, a short time before his death, told his nephew, "that it was his intention to leave him but little money, as he had derived too much pleasure from making his own fortune to deprive him of doing the same."

Baillie, after the example of his distinguished relatives, devoted himself with indefatigable industry and unremitting diligence to the work of investigating the healthy structure of the human body and its functions, as well as the deviations from this in the various morbid structures which are presented in the dissecting-room. The knowledge thus acquired proved the foundation of his future usefulness and fame, and from his own experience he was accustomed to inculcate the duty of medical practitioners to make themselves minutely acquainted with anatomy and physiology. In 1785, two years after William Hunter's death, Baillie, in conjunction with Mr. Cruickshanks, gave his first course of anatomical lectures. So well was he qualified for the office, although only in his twenty-fifth year, that the number of pupils at the school was equal to the number which attended the lectures of William Hunter. In his introductory lectures he seems to have anticipated the now universally received opinion, that the vital actions of the body, morbid as well as healthy, are carried on in the extreme vessels, or more minute tissues of the organs. "It must have occurred," he observes, "whenever men were disposed to reason on the subject, that the actions of an animal body are not to be referred to the larger parts, but to the smaller, of which these are composed. Hence the examination of minute structure is evidently more connected with physiology, and if ever the latter is to be known at all, it must be through the medium of the former." He took every opportunity of preserving morbid structure, and thus formed a museum of great value. This collection, which now enriches the College of Physicians of London, was liberally presented to that body by Dr. Baillie during his lifetime, along with 400*l.* to keep it in a proper state of preservation. To the same body, in his will, he bequeathed his medical library.

In 1787, though only a Bachelor of Medicine, he was appointed physician to St. George's Hospital, and two years afterwards he received his degree of Doctor of Medicine from the University of Oxford, upon which he became a Fellow of the College of Physicians. In 1789 he married Sophia, the second daughter of Dr. Denman, at that time a very eminent accoucheur in London. In the performance of his important duties at St. George's Hospital, his assiduity and natural powers of observation, aided by his great knowledge, his clear perception, and correct reasoning powers, soon made him highly distinguished for his power of discriminating diseases in the living body, or in what is technically termed the 'diagnosis' of diseases.

To render the collections of his uncles, as well as his own, useful to the public, he, in 1795, published his 'Morbid Anatomy,' "a work which, whether we consider the subject or the manner in which it is treated, has been justly estimated as one of the most practically useful and valuable acquisitions to medical science." (Wardrop.) It was soon translated into French, Italian, and German. About four years after the appearance of this work he began to publish engravings for its illustration: these, as well as the work itself, will remain a lasting memorial of the zeal, the industry, and the talents of their author. He also edited William Hunter's work on the 'Gravid Uterus' (left in manuscript), to which he made some additions. To a second edition, published in 1797, of his 'Morbid Anatomy,' he added the 'Symptoms' of the different morbid lesions described in it, so far as they were known. In 1799 he resigned his office of physician to St. George's Hospital, and gave up his anatomical lectures, his time being entirely occupied in the practice of his profession.

The progress of a physician is proverbially slow; and though no man laboured more in early life than Dr. Baillie, and no one ever commenced under more favourable circumstances, he was nearly forty years of age before he found himself fully established in practice. His progress from this time was rapid and his success complete. Dr. Pitcairn, having been obliged to relinquish his practice and retire to a warmer climate, recommended Dr. Baillie to his patients; and though Dr. Pitcairn was able to return partially to discharge the duties of his profession, the death, which occurred in 1809, of this able physician made a most favourable opening for Dr. Baillie. On this accession of practice Dr. Baillie removed from Windmill-street to Grosvenor-street.

Dr. Baillie added to his great facility in diagnosis a knowledge of the precise effects and extent of the powers of medicines. He excelled in the art of delivering his opinion on a case, being concise, clear, and practical, his language simple, and remarkably free from technicalities. His manner was natural and unassuming, yet decided and impressive; and he was the same to all persons and on all occasions. He was moreover remarkable for the considerate attention which he paid to the feelings of his professional brethren, more particularly to the younger members of the profession. The consequence was, that he never lessened the confidence of the patient in his ordinary attendant, while he himself acquired the good will and esteem of all whom he met in consultation. "He used to narrate, in the most open manner, the history of his own life, and to describe to the younger members of the profession the rocks and shoals which he had met with, contrasting these with his long-looked for but ultimate success. He pointed out the necessity of competency, of integrity, and of industry, and the slow progress of the most eminent men who had gone before them; and, on the other hand, the transitory fame of all those who had ever attempted to gain professional reputation as if by storm."

During the period when he was most fully occupied, he frequently exhibited however much irritability of temper; but any display of this kind was followed by sincere compunction, and by efforts to make reparation to those who had suffered from it. It is difficult to say whether, in cases where he considered remuneration for his services beyond the means of the patient, his generosity, or the delicacy with which he carried it into effect, was the greatest. His refined regard for the feelings of the objects of his kindness greatly enhanced its value. It was no unmerited eulogium which was passed upon him by his distinguished contemporary Sir H. Davy, when he said of him, "his highest ambition was to be considered as an enlightened and honourable physician: his greatest pleasure appeared to be in promoting the happiness and welfare of others." His physical frame was feeble, compared with his mental powers. He was under the middle stature, and of rather a slender form. His countenance was marked with a great deal of sagacity and penetration. He continued in the unremitting exercise (with a few occasional exceptions) of his profession till the spring of the year 1823, when he became affected with chronic inflammation of the trachea (or windpipe), for which he went to Tunbridge, and afterwards to his estate in Gloucestershire, where he died on the 23rd of September 1823, in the sixty-third year of his age.

Dr. Baillie was frequently called upon to render his professional services to members of the royal family. The Princess Amelia, George III. (on whom he attended for ten years), and the Princess Charlotte of Wales, appointed him their physician. His friends erected a monument to him, with a suitable inscription, in Westminster Abbey.

Dr. Baillie's works were published in 2 vols. 8vo, London, 1825, edited by Mr. Wardrop, who prefixed a sketch of his life, from which most of the above particulars are taken. A posthumous volume, of which only 150 copies were (according to directions in his will) printed, but not published, contains his two introductory lectures to his anatomical class, 1785; his Gulestonian lectures on the nervous system, delivered before the College of Physicians in 1794; and some brief observations on a number of diseases, in which he communicates the result of his experience.

BAILLY, JEAN SYLVAIN, was born at Paris, September 15, 1736. Having become acquainted with Lacaille, Bailly was led to attach himself to the study of astronomy; but dazzled by the success of a young friend, the youthful Bailly paid for a brief space ardent court to the tragic muse. He had, in his 16th year, composed a couple of tragedies;

but he prudently took counsel of La Noue, the actor, who advised him to devote himself to science. Bailly followed his advice, and to good purpose, as his rapid progress showed. In 1762 he was able to present to the Academy some lunar observations; he was admitted to the Academy in 1763, and in the same year reduced Lacaille's observations of zodiacal stars, and began to turn his attention to the theory of the satellites of Jupiter. This was the subject of the prize offered by the Academy for 1764; and Bailly, by applying the formulae which Clairaut had employed in his lunar theory, was enabled to deduce from the hypothesis of gravitation several of the inequalities observed by Bradley and Wargentin. The prize was gained by Lagrange, who, by a new and more powerful analysis of his own, carried the theory much farther; but the attempt of Bailly immediately placed him among the successors of Newton. His essay 'Sur la Théorie des Satellites de Jupiter' was published in 1766. In 1771 he wrote a curious and original paper on the light of the satellites of Jupiter, which he had measured by finding how much the object-glass of a telescope must be diminished in order to make these bodies disappear. In 1775 he published the first part of his 'History of Astronomy.' This work was completed in 1787 by the publication of his 'Indian Astronomy;' and the works which subsequently came from his pen were 'Lettres sur l'Atlantide,' 1779; 'Lettres sur l'Origine des Sciences,' 1777; 'Essai sur les Fables et sur leur Histoire,' written in 1781-82, published posthumously in 1799. Their author was a candidate for the secretaryship of the Academy in 1781, at which time Condorcet was preferred by the exertions of D'Alembert; but Bailly was elected to the Académie Française in 1784, and to the Académie des Inscriptions, &c., in 1785—he and Fontenelle being the only two instances of Frenchmen who belonged at once to all the three academies, and himself the only academicien whose bust adorned their library during the life of the original. Bailly furnished reports to the Academy of Sciences on animal magnetism (1784), and on the plan of a new Hôtel-Dieu (1786), as well as his 'Eloges' of Charles V., Molière, Corneille, Lacaille, Leibnitz, Cook, and Gresset, which were collected and published in 3 vols., 8vo, 1770.

At the election of the States-General in 1789, Bailly was the first chosen for Paris. He was chosen president of the Tiers-Etat (June 17, 1789), the day after that body declared itself a National Assembly. He held this office during the memorable sittings at the Jeu-de-Paume on the 20th, and at the church of St. Louis on the 23rd, during the personal attempt of the king to disperse the Assembly; at the consolidation of the three orders on the 27th, and till July 2nd. His conduct pleased the people of Paris, who elected him mayor of their city on the 15th of July, being the time when the king visited Paris after the fall of the Bastille (July 14th). At this period Mirabeau, Lafayette, and Bailly were the three most marked men of the revolution; and Mignet calls the first the tribune of the people of Paris, the second the general, and the third the magistrate.

During the period of his mayoralty, Bailly did not completely satisfy either extreme, being charged with devotion to and contempt of the royal cause by the two parties. The most remarkable incident in his political career was that of the 17th of July, 1791. The attempt at escape on the part of the king had irritated the republican party, and the gathering of foreign troops on the frontier had lent colour to their violence. A tumultuous assembly, headed by all the chiefs of the Jacobins (as they were afterwards called), assembled in the Champ-de-Mars to petition for the dethronement of the king. These were, after remonstrance, fired on by the National Guard under Lafayette and Bailly. The account of Bailly himself is, that the firing took place against his consent.

The measure of the 17th was approved by the Assembly, but Bailly offered his resignation on the 19th of September, and finally relinquished his mayoralty on the 16th of November. He either travelled abroad or retired to Nantes, according to different accounts, till towards the middle of 1793. During this time he compiled memoirs of the revolution and its causes, which were published in 1804. The execution of Louis XVI., on the 21st of January 1793, made Bailly apprehensive as to his own safety. He wrote to Laplace, who had retired to Melun, wishing to know whether he might safely come there. Laplace answered that he might; but, in the meanwhile, the insurrection of the 31st of May established the armed power of the Jacobins, and Laplace wrote again to Bailly, warning him not to come, as a detachment of the revolutionary army was at Melun. In spite of this warning he had the imprudence to venture. He was recognised by a soldier in the streets, seized, and conducted after some delay to Paris. He was charged, as well with the affair of the 17th of July, already alluded to, as with conspiring in favour of the late royal family. Being produced as a witness on the trial of Marie Antoinette, he denied all accession to any scheme of the latter nature, and declared his conviction of the falsehood of all the charges brought against the queen. His own trial took place on the 10th of November. The day preceding he published his justification, which is to be found in the 'Procès Fameux,' vol. II. The next day, or the next but one, he underwent the common fate, attended by circumstances of unusual cruelty and insult. His demeanour is represented as having been perfectly calm; and he is said to have answered the remark, "Bailly, you tremble," addressed to him by one of his persecutors, with, "My friend, 'tis with cold."

Even in the time of his greatest popularity, Bailly appears to have had enemies, who propagated the most absurd charges. His friends affirm that he was retired, simple, and rather approaching to severity. But the unusual and solid respect paid him by his countrymen before his political life began—the arduous employments which fell thick upon him at the very first moment when a plebeian could be called into public life—and the furious anger which he excited among the savages of 1793—are so many strong presumptions that he must have been no common character, even among the distinguished.

The character of M. Bailly as a writer is that of one of the most interesting and elegant among many. On the history of science no man has treated so as to approach him in the agreeable qualities of style. But his system is baseless, being built only upon surmises or conjectural interpretations of fact. His most remarkable conjecture is, that some nation, whose name is now lost, was the common original of the Egyptian, Chaldean, Hindoo, and Chinese astronomy. When his 'History of Astronomy' appeared, the elegance of the style, and the plausibility of the hypothesis, caught the whole world; but the praise which he received from the English and French writers had little justification—one reason for it was that there was no work on the subject in existence which could claim the title of history. The work of Delambre soon dispelled the mist from the eyes of scientific men. Still, were we to collect the sentiments of our most celebrated works of reference on the merits of Bailly's 'History,' and compare them with those expressed in France at the time of its appearance, as well as at the present day, the reader would smile to see that we have been receiving the light of a star which has long been extinguished, a phenomenon as likely to happen in morals as in astronomy.

* BAILY, EDWARD HODGES, R.A., was born at Bristol, March 10, 1778. Having early in life acquired the rudiments of the art of modelling, Mr. Baily commenced his career as an artist by the production in his native city of small wax portrait busts; but wishing to extend his knowledge of art, he obtained an introduction to Flaxman in 1807, and that eminent sculptor was so pleased with the specimens of his skill which he submitted to him, that he invited him to London, and for nearly two years admitted him into his studio as a pupil. At the same time Mr. Baily entered as a student at the Royal Academy, where in 1809 he obtained a silver medal, and in 1811 carried off the gold medal with the stipend of 50*l*. At first he chiefly exhibited classical figures (Apollos, Nymphs, &c.), which were much admired for their grace, simplicity, correct proportions, and careful execution; but the work which fixed his rank among the first sculptors of the English school, and rendered him generally popular, was the well-known figure of 'Eve at the Fountain'—now in the rooms of the Bristol Literary Institution. This work was exhibited at the Royal Academy Exhibition in 1813. The year before it appeared he had been elected an Associate of the Royal Academy; in 1820 he was elected an Academicien. About this time he was employed by George IV. to execute the sculpture in the front of Buckingham Palace, as well as some for the interior of the palace, and on the triumphal arch which stood in front of it, but is now removed to Hyde Park Corner. During his later years Mr. Baily has devoted the chief share of his time to the production of busts and portrait statues. Many of the principal statues which have been erected of late years in London and the provinces have been executed by him. Among these may be mentioned those of Nelson, Telford, the Earl of Egremont, Earl Grey, and the seated statue of Lord Mansfield at Chelmsford; but many others might be named of equal and some perhaps of higher excellence. But Mr. Baily has seldom allowed an exhibition of the Royal Academy to pass without sending at least one poetic design, and some of them have ranked among the happiest and most original which have been seen there. His 'Eve listening to the Voice' (the companion to the 'Eve at the Fountain') was exhibited in 1841; his 'Psyche,' 'Helena,' 'Hercules casting Hylas into the Sea,' the 'Sleeping Nymph,' 'Maternal Love,' 'Girl preparing for the Bath,' &c., may be named as among the best known of these; but the most remarkable, and in some respects one of the very finest works of recent English sculpture, is one of his latest works, 'The Graces Seated.'

BAILY, FRANCIS, was born April 23, 1774, at Newbury in Berkshire, where his father was a banker. Mr. Baily is a remarkable instance of successful application of talent, for while actively engaged in business, as a stock-broker, in which he accumulated a large fortune, he gained a first-rate reputation in one species of mathematical application, and laid the foundation of another, to be completed after his retirement from the Stock Exchange at the age of fifty-one. He had a good working knowledge of mathematics, in all the elementary branches, and an extensive acquaintance with English writers on the subject. He first published his 'Tables for the Purchasing and Renewing of Leases' (1802, 1807, 1812, 8vo); next, the 'Doctrine of Interest and Annuities' (1803, 4to); then the 'Doctrine of Life Annuities and Assurances' 1810, 8vo); lastly, 'Appendix to the Doctrine of Life Annuities and Assurances' (1813, 8vo); also, 'An Account of the several Life Assurance Companies' (1810, 1811, 8vo), which is an extract from the work on Life Assurance. He retired from business in 1825. From this time till his death, he was engaged with all the energy of his character in the promotion of astronomy. Between the ages of fifty-one and seventy, when most men in his circumstances would have been enjoying the leisure to which commercial men

above all others are apt to look forward, he did the work of a lifetime. He was (in 1820) one of the founders of the Astronomical Society, and paid very great attention to its affairs. He was one of those who exerted themselves to produce a reformation and enlargement of the Nautical Almanack, and whose efforts at last prevailed upon the government to place it upon its present distinguished footing. In pendulum experiments he was among the foremost of those who investigated the newly observed effects of the air upon that instrument. The repetition of the Cavendish experiment was conducted in his house and under his superintendence. The Astronomical Society's catalogue of stars was the suggestion of Mr. Baily and Mr. Gompertz, and was superintended by Mr. Baily. The remarkable circumstances attending the publication of Mr. Baily's 'Life of Flamsteed' are detailed in another place. [FLAMSTEED.] He put the finishing hand to his revision of ancient catalogues in the 13th volume of the 'Memoirs of the Astronomical Society' which is entirely his own work, and printed at his own expense. He suggested to the British Association the republication of the immense catalogue of Lalande, called the 'Histoire Céleste,' combined with that of Lacaille; the two together containing 57,000 stars. He suggested to the same body the extension of the Astronomical Society's catalogue to 10,000 stars, accompanied by the coefficients of reduction. He superintended the construction of the tables and a portion of the printing, and he left the preface to the latter completely written. All these catalogues are now published; the Lalande and Lacaille very recently. He had also undertaken the construction of the new standard scale, wanted by the government in consequence of the destruction of the old one.

Mr. Baily died August 30, 1844. His last public appearance was at Oxford, on the 2nd of July, to which place he went, with some difficulty, to receive the honorary degree of Doctor of Civil Law. He was never married. Mr. Baily was distinguished by great industry, which was made more effective by his methodical habits, and also by a suavity of manner which greatly enlarged the circle of his friends. In the last twenty years of his life, he did much more and better work than younger men of much greater original power have done in twice the time. And, besides this, his admirable personal qualities, which made it so easy to co-operate with him, led to his being able to make others do more than they could have done without him. His high moral worth added to his power; and all these together made him the most influential member of the astronomical world. The history of the astronomy of the 19th century would be incomplete without an account of his valuable labours. Those who are well acquainted with Delambre's history of the science will easily imagine how much that severe judge would have abated of his rigour, had there come before him such models of patient thought, all but impeccable accuracy, careful research, and well-chosen objects, as the writings of Francis Baily. A minute account of Mr. Baily's writings is given in a memoir by Sir John Herschel, read to the Astronomical Society in 1844.

BAINBRIDGE, or BAMBRIDGE, CHRISTOPHER, archbishop of York, and cardinal-priest of the Roman Church, was born at Hilton, near Appleby, in Westmorland, and received his education at Queen's College, Oxford, of which he became provost in 1495, and was created Doctor of Laws about the same time. He was afterwards a liberal benefactor to his college. In 1503 he became Dean of York; in 1505 Dean of Windsor; and, in the same year, Master of the Rolls and one of the king's privy council. In 1507 he was advanced to the see of Durham, and was translated the next year to the archbishopric of York.

Bainbridge distinguished himself chiefly by his embassy from king Henry VIII. to Pope Julius II., who created him cardinal of St. Praxede, in March, 1511, and eight days afterwards appointed him legate of the ecclesiastical army which had been sent into the Ferrarese, and was then besieging the fort of Bastia. His letter to king Henry VIII., concerning the pope's bull giving him the title of most Christian King, is extant in Rymer's 'Fœdera' (edit. 1704-35, vol. xiii. p. 376). Cardinal Bainbridge died at Rome, July 14th, 1514, and was buried in the English hospital (since called the English college) there. His death was caused by poison administered by Rinaldo de Modena, a priest whom he had employed in menial offices, and who after confessing that he was suborned to this act by Sylvester de Giglia, bishop of Worcester, who was at that time envoy from king Henry VIII. to Rome, committed suicide. The violence of the cardinal's temper to those about him is particularly dwelt upon by Oldoinus, the continuator of Cicconius.

(*Biographia Britannica*, edit. 1778, vol. i. p. 515; Wood, *Athene Oxon.* edit. Bliss, vol. ii. p. 702; Ellis, *Original Letters*, 1st series, vol. i. pp. 99, 106, 108; 2nd series, vol. i. p. 226.)

BAINBRIDGE, JOHN, an astronomer of merit, was born in 1582 at Ashby-de-la-Zouch, and died in 1643 at Oxford. He was the first Savilian professor of astronomy in that university, being appointed to that office in 1619 by Sir Henry Saville himself. He was also a Doctor of Medicine, and a good oriental scholar, having studied Arabic for the purpose of reading the astronomers who have written in that language. He published an 'Astronomical Description of the Comet of 1618,' and several other works, of which, as well as of his unpublished manuscripts, a list is given by Hutton. (Martin, *Biographia Philosophica*; Hutton, *Dictionary*.)

BAIRD, SIR DAVID, Bart., general in the British army, and

K.C.B., was born on the 6th December 1757, at Newbyth, in Scotland. He entered the service at fifteen years of age, as an ensign in the 2nd regiment of foot, and obtained a company in 1778, in the 73rd Highland regiment. Before entering upon active service he spent some months at an academy at Chelsea, then held in much esteem as a school of military discipline, where he displayed some of that firmness of character by which he was afterwards characterised. In 1779 Captain Baird accompanied his regiment to India, and was present at the disastrous affair of Peramboucou, on the 10th September 1780, when a handful of British troops, after a most gallant defence, were perfidiously slaughtered by the army of Hyder Ali, after they had surrendered to a force twenty times their number. As soon as the British had laid down their arms, the cavalry of Hyder, commanded by his son Tippoo, rushed forward, and literally cut them to pieces. Captain Baird received several severe wounds, and barely escaped with life. He surrendered to some French officers in the enemy's service, by whom he was treated with much kindness. They had not however the power of restoring the English prisoners to liberty. The strong fortress of Seringapatam was the destination of Baird and about 400 British soldiers. Here he endured with firmness and equanimity a captivity of nearly four years' duration, embittered by every privation and suffering which savage vengeance could devise. After his release Baird visited England, and returned to India in 1791 with the rank of lieutenant-colonel. Believing that the British authorities acted oppressively in the affairs of the Rajah of Tanjore, he quarrelled with them, and left India in disgust on the 17th October 1797, for the Cape of Good Hope. He however returned soon after with the rank of brigadier-general, and was engaged in active service under General Harris in the war which again broke out between the British government and the Sultan of Mysore, Tippoo, the son of Hyder Ali. After various successes the British army encamped under the walls of Seringapatam, a fortress of great strength, and defended by a numerous and confident army. The British commander determined to take it by storm; and the conduct of the dangerous enterprise was, at his own solicitation, given to Major-General Baird, the reserve being intrusted to Colonel Wellesley, while Harris held himself prepared to lead on the main body of the army in case of the failure of the assault. Baird gallantly led the assault on the 4th of May 1799. Ascending the parapet of the trenches in full view of both armies—"a military figure," observes Colonel Wilks, "suited to such an occasion"—and drawing his sword with the gallant bearing of a knight of romance, he shouted, in a tone that thrilled along the trenches, "Now, my brave fellows, follow me, and prove yourselves worthy the name of British soldiers." Within a very brief space the English flag waved from the outer bastion of the fortress; and before night Seringapatam was in possession of the besiegers. The skill and intrepidity displayed by General Baird on this memorable occasion were only equalled by his humanity towards the captives.

Throughout his professional career General Baird complained that he had to endure many of those slights and mortifications to which persons not of commanding birth and ministerial influence are too frequently subjected in the British army. At the time of the taking of Seringapatam, Lord Mornington (afterwards Marquis Wellesley) was governor-general of India: his brother, Colonel Arthur Wellesley (the late Duke of Wellington, who even then displayed the qualities of a skilful officer) commanded a corps of reserve under General Baird. Usage entitled Baird to the command or governorship of the town which he had taken, even had his services been less brilliant and successful. Under this impression he took possession of the palace of Tippoo, who was among the slain, as his head quarters. He was next day abruptly commanded to deliver up the keys of the town to Colonel Wellesley, who, as it happened, had no active share in the capture. "And thus," said Baird, "before the sweat was dry on my brow, I was superseded by an inferior officer." Whether the superseding of Baird was contrary to military etiquette or not, has been warmly discussed. Baird himself was extremely annoyed at it, yet it is asserted that he had requested to be relieved; and it is certain that Colonel Wellesley had already shown those powers of organisation, decision, and cool judgment so important in the commander of a city just captured by assault, and for which Wellington was so remarkable, and in which Baird was always deficient. Baird's friends have however always maintained that Wellesley was appointed to the command because he was brother to the governor-general, and not because of his peculiar fitness. The storming of Seringapatam was the great achievement of Sir David Baird's military life. He received the thanks of Parliament and the East India Company for his brilliant conduct at Seringapatam, and declined a pension from the company, in the hope, which was not at that time realised, of being rewarded by a red ribbon by his sovereign.

In 1801 General Baird was sent from India to co-operate with the British troops in Egypt against the French, but a truce having been agreed to just as he was approaching the British position, he returned to India by way of the Red Sea, and landed at Calcutta July 31, 1802. Soon after his arrival he was removed to the staff of the establishment at Fort St. George, Madras, at his own request. He was afterwards engaged in the hostilities against Scindiah and the Rajah of Rajpore. During this campaign, considering himself neglected and thwarted, and having in vain remonstrated with the government

of Madras, he applied for leave of absence, which being granted, he relinquished his command and returned to Europe.

In 1805 General Baird commanded an expedition directed against the Dutch settlements at the Cape of Good Hope, took Cape Town, and was proceeding to organise his conquest when he was recalled for having sanctioned an ill-judged expedition of Sir Home Popham against one of the possessions of Spain in South America. In 1807 he accompanied Lord Cathcart in the expedition of that year against Denmark; and though wounded twice during the capture of Copenhagen, he is hardly mentioned in the despatches; while General Wellesley, his junior, who also had a command under Lord Cathcart, is made the subject of an elaborate eulogy. On his return he was sent to superintend a 'camp of instruction' in Ireland; an employment which would imply that his proficiency in the mechanical branches of the military art was rated more highly, and probably with justice, by his superiors than his fitness to command an army. In 1808 Baird commanded a large force that was sent out to co-operate with Sir John Moore, then commander-in-chief of the British army in the Peninsula. This force formed part of Sir John Moore's army in his retreat to Coruña, and shared in the glory of the battle of that name, which vindicated the honour of the English arms. On the death of that excellent officer, General Baird, as second in command, became commander-in-chief, and the despatch relating to the battle was accordingly written in his name. He was however too severely wounded to take advantage of the accidental promotion; for he received some grape-shot in the left arm, which so shattered the bone of the arm and shoulder, that amputation from the socket became necessary. On his return he received the thanks of Parliament for his gallant conduct, was gratified with the long-sought-for red ribbon, and created a baronet.

In 1810 Sir David Baird married Miss Campbell Preston, of Perthshire, with whom he received considerable estates in that county. In 1814, at the termination of the war, he applied for a peerage and pension, considering the baronetcy and K.C.B. honour quite inadequate to the length and importance of his services; but he failed in his application. In 1820 Baird was appointed commander-in-chief in Ireland, but remained in office only long enough to show that though an intrepid and gallant soldier, he was wholly ignorant of the principles of good government. He was removed from his command in 1821, when the Marquis Wellesley became Lord-Lieutenant. From this period till his death, in 1829, he lived in retirement.

(*Life of General Sir David Baird, &c.*; Mill, *British India*; Colonel Mark Wilks, *Historical Sketches of the South of India*; Napier, *History of the Peninsular War*; *Notes on the Campaign of 1808-9 in the North of Spain*, by Colonel Sorrell, Baird's Military Secretary.)

BAKER, DAVID, an English Benedictine monk and ecclesiastical historian, was born at Abergavenny, December 9th, 1575. He received his early education at Christ's Hospital, London, whence, in 1590, he went to Oxford, where he became a commoner of Broadgate Hall, now Pembroke College. Here he is recorded by Anthony à Wood to have fallen into vicious and disorderly habits. Having left the university without a degree, he came to London, and joined his brother Richard, a barrister of the Middle Temple, where he studied law, and, in addition to the loose courses he had followed, became a professed infidel. After the death of his brother, his father, who was steward to Lord Abergavenny, got him appointed to the office of recorder of the town of Abergavenny. Here, whilst returning home from holding a court at a distant place, a miraculous escape from drowning recalled him to a sense of religion, and led to his joining the Roman Catholic Church. Taking a journey to London, he fell in with some Benedictine fathers of the Cassine congregation, with one of whom he shortly after repaired to Italy, giving no further notice of his intentions to his father than that he was going to travel. At Padua he was admitted to the habit of religion by the Abbot of Justina, May 27, 1605, about which time he changed his name from David to Augustine Baker. The state of his health rendering it necessary that he should return to England, he arrived at home just in time to reconcile his father, who was dying, to the Roman Catholic faith. After providing for his mother, and disposing of his own estate, he gave himself to the duties of his profession, residing partly in London and partly with Roman Catholic families in the country for some years, after which he retired for a time to Douay. Subsequently he became the spiritual director of the convent of English Benedictine nuns at Cambray, and also their confessor. With them he passed nine years, and then again returned to Douay.

About 1621 an employment was recommended to him by the superiors of his order, that of searching after and transcribing the records of the ancient congregation of the Black or Benedictine monks in England. His collections on this subject filled six volumes in folio. They are said to have been lost; but Father Clement Reyner's 'Apostolatus Benedictinorum in Anglia,' fol. Duac. 1626, was arranged and methodised from them, and they supplied many of the materials of Cressy's 'Church History,' fol. Roan, 1668. Baker's religious treatises were numerous, filling nine folio volumes of manuscript; these, in Wood's time, were preserved in the monastery of the English Benedictine nuns at Cambray. Among the names of the literary friends of Baker, those of Sir Robert Cotton, Sir Henry Spelman, Selden, Camden, and Godwin, are especially recorded. He died in Gray's Inn-lane, August 9th 1641, and was buried at St. Andrew's, Holborn.

(Wood, *Athenæ Oxon.*, edit. Bliss, vol. iii. col. 7; Grainger, vol. ii. p. 200; Chalmers, *Biog. Dict.*)

BAKER, HENRY, whose name is familiar to those who are interested in microscopic observations, was the son of William Baker, a clerk in Chancery. He was born on the 8th of May 1698, in Chancery-lane, London. In 1713 he was placed with a bookseller, whom he left in 1720 to reside with Mr. John Forster, an attorney. Here he first practised tuition on the deaf and dumb, an employment which he afterwards followed with much success, his first pupil being Mr. Forster's daughter. The names of some of the first families in the land are to be found among his scholars. In 1724 and 1725 he published some poems of a licentious character; and from that time to 1737 his labours appear to have been chiefly literary. In 1729 he married the daughter of the celebrated Daniel Defoe, and in 1740 was elected first a Fellow of the Society of Antiquaries, and soon after a Fellow of the Royal Society. He now gave proof of his talent for accurately observing objects of natural history; and about two years after his election he published the first edition of 'The Microscope made Easy,' which was followed by his 'Employment for the Microscope.' In 1744 he received from the hands of Sir Hans Sloane, President of the Royal Society, the Copley medal, for his microscopical experiments on the crystallisations and configurations of saline particles. His experiments upon the fresh-water polype (*Hydra viridis*), and upon other minute animals, are very curious and instructive, and his observations are still valued. He died in the Strand on the 25th of November 1774, in his 77th year, and was buried in the churchyard of St. Mary-le-Strand. His collection of natural productions, with some antiquities, &c., occupied ten days in the sale, which took place in 1775. The larger alpine strawberry and the true rhubarb (*Rheum palmatum*) were introduced by Baker into this country; he also made us acquainted with the history of the *Coccus Polonicus*, or cochineal of the north, transmitted by Dr. Wolfe.

BAKER, SIR RICHARD, the author of the 'Chronicle of the Kings of England' known by his name, was born about the year 1563. Wood ('*Athenæ Oxonienses*'), the writer of the article 'Sir Richard Baker' in the '*Biographia Britannica*,' makes Sissinghurst in Kent his birth-place; but Fuller, who speaks of him as a personal acquaintance in his '*English Worthies*,' states that he was a native of Oxfordshire. Sir John Baker, Chancellor of the Exchequer to Henry VIII., was one of his ancestors. Richard Baker was educated at the university of Oxford, knighted in 1603, and married and settled in Oxfordshire before the year 1620. Being in pecuniary difficulties soon after his marriage, he was thrown into the Fleet prison, where he spent the remaining years of his life, and died in the year 1644-45 in a state of extreme poverty. It was during his imprisonment, and as a means of subsistence, that he wrote his 'Chronicle' and various other works.

Of the 'Chronicle,' the most celebrated of his works, the author has himself said, "that it was collected with so great care and diligence, that if all other of our chronicles should be lost, this only would be sufficient to inform posterity of all passages worthy or memorable to be known." Although Baker's 'Chronicle' is by no means entitled to this high commendation, at the same time we are not surprised at the great popularity which it enjoyed for more than a century after its publication (1641) among the squires and ancient gentlewomen of the school of Sir Roger de Coverley. The manner was new, and as the author of the '*Historical Library*' remarked, in his coarse fashion, "pleasing to the rabble;" meaning by the term 'rabble' all persons not eminently learned. Hollinshed was too bulky and Speed too dull a writer to be popular; and Sir Richard's residence in the Fleet was a hindrance to the compilation of a book overloaded with those numerous references to authorities and antiquarian researches which perplex and weary the general reader, however acceptable to the learned. Though full of errors, Baker's 'Chronicle' was long the text-book of English history to country gentlemen and their families, but it is now little read. The other works of Sir R. Baker consist chiefly of meditations, prayers, and other devotional books. In a posthumous work published in 1662, the '*Theatrum Redivivum*,' he endeavoured to show that the fathers were not so opposed to dramatic representations as Prynne had represented in his '*Histrio-Mastix*.'

Sir R. Baker's 'Chronicle' brought the history of England down to the death of James; he wrote also a few lines of the reign of Charles I. by way of introduction. A fourth edition of the 'Chronicle' was published in 1665 by Edward Phillips, the nephew of Milton, bringing the work to the coronation of Charles II. Phillips says ('*Epistle to the Reader*'), that as to the transactions of Monk (duke of Albemarle), he had permission to make use of his "Excellencie's own papers, and several other private collections of persons active with him in that service."

(Wood, *Athenæ Oxonienses*; Fuller, *English Worthies*; *Biographia Britannica*.)

BAKER, THOMAS, the Cambridge antiquary, was born at Crooke, in the parish of Lanchester, near Durham, September 14th, 1656. His father was George Baker, Esq., and his grandfather Sir George Baker, Knight, recorder of Newcastle. Thomas Baker was educated in the free school at Durham, and afterwards sent, with his elder brother George, to Cambridge, where he became a pensioner at St. John's college, July 9th, 1674, and was elected fellow of his college in March 1679. He entered into orders in 1685, and in June 1687 was collated

by Lord Crew, then bishop of Durham, to the rectory of Long Newton in that diocese, which he resigned in 1690, upon refusing to take the oaths to King William. He now retired to his fellowship at St. John's, in which he was protected till January, 20th, 1717, when again refusing to take the oaths to a new government, he was ejected, in company with several other learned men. Mr. Baker retained a lively sense of this deprivation, which he expressed by writing in the blank leaves of all the books which he afterwards gave to the college, "Tho. Baker Coll. Jo. socius ejectus." He appears to have had the sympathy and pecuniary assistance of Edward Lord Oxford and other friends after this deprivation, but his only settled income was an annuity of 40*l.* a year. His death took place on July 2nd, 1740. Dr. Heberden, who attended him, communicated a memorandum of his last illness and death, which he had made at the time, to Mr. Cole, in a letter dated October 18th, 1777, still preserved among Cole's Manuscripts in the British Museum.

Being appointed one of the executors of his elder brother's will, by which a large sum was bequeathed to pious uses, Mr. Baker prevailed on the other two executors, who were his other brother, Francis, and the Hon. Charles Montague, to lay out 1310*l.* of the money upon an estate to be settled upon St. John's College for six exhibitioners. He likewise gave the college 100*l.* for the consideration of six pounds a-year (then legal interest) for his life; and to the library several choice books, both printed and manuscript; medals and coins; besides what he left to it by his will, which were "all such books, printed and manuscript, as he had, and were wanting there."

All that Mr. Baker printed was, 1, 'The preface to Bishop Fisher's funeral sermon for Margaret, Countess of Richmond and Derby,' 8vo, Lond. 1708; 2, 'Reflections on learning, showing the insufficiency thereof in its several particulars, in order to evince the usefulness and necessity of Revelation,' 8vo, Lond. 1710, which went through eight editions: both works were without his name. His manuscript collections relative to the history and antiquities of the University of Cambridge formed the great labour of his life, and chiefly entitle him to a notice here. They amount to thirty-nine volumes in folio, and three in quarto, closely written. The British Museum possesses twenty-three volumes, which he bequeathed to the Earl of Oxford, his friend and patron; the Public Library at Cambridge contains sixteen volumes in folio and three in quarto, which he bequeathed to the University. A minute account of the contents of every volume will be found in the 'Catalogue of Mr. Thomas Baker's MS. Collections' appended to Masters's Memoir of him, and in the 'Biographia Britannica,' vol. i. p. 521-25. The catalogue of the Harleian Manuscripts contains an account of those deposited in the Museum.

The assistance which Mr. Baker gave to his contemporaries engaged in literary pursuits was valuable and extensive; such aid is more particularly acknowledged by Walker in his 'Sufferings of the Clergy,' by Bishop Burnet, Archbishop Wake, Strype, Thomas Hearne, Professor Ward, Browne Willis, Peck, Le Neve, Bishop Kennet, Dr. Conyers Middleton, Dr. Waterland, Dr. Zach. Grey, &c. The Society of Antiquaries have a portrait of Mr. Baker, and there is another in the picture-gallery at Oxford.

(*Biographia Britannica*; *Masters, Memoirs drawn from the Papers of Dr. Zach. Grey*, 8vo, Camb., 1784; and *Cole's MS. Collections*, Brit. Mus. vol. xxiii., xxvii., xxx., xxxi., with his *Athen. Cantabr. lett. B.*)

BAKEWELL, ROBERT, a celebrated agriculturist and improver of live-stock. He was born, about the year 1725, at Diahley, in Leicestershire, and died there in the year 1795. Though it does not appear that he contributed anything to literature, even on the subjects to which he devoted his life, his efforts, particularly to improve the breed of cattle, procured for him a widely-extended reputation: the long-horned breed which he introduced is designated by the name of the Diahley or New Leicestershire breed. He also paid much attention to improving the breeds of horses, pigs, and sheep. He is to be distinguished from another Robert Bakewell, who, in 1808, published 'Observations on Wool,' with notes by Lord Somerville.

BALBI, ADRIEN, was born at Venice on April 25, 1732. At an early period of his life he was appointed professor of geography and also of natural philosophy in his native town. In 1820 he took up his residence in Portugal. Here, from the archives of the kingdom, he procured the materials for his '*Essai statistique sur le royaume de Portugal et Algarve, comparé aux autres États de l'Europe*,' published in Paris in 1822. After having settled in Paris, and employed himself in collecting rich and varied materials for many years, he published in 1826 the first volume of his '*Atlas ethnographique du Globe; or, Classification des Peuples anciens et modernes d'après leurs Langues*.' This work first made the French public acquainted with the researches of Adelung and other German philologists. Balbi however improved their arrangement, and added much information gathered from the accounts of such travellers as A. Humboldt, Freycinet, and others, as well as from linguists such as G. Humboldt, Remusat, Champollion, Klaproth, &c. This work attained a deservedly high reputation. Under the administration of Martignac, Balbi received from the government such pecuniary assistance as rendered his circumstances easy. He had previously published, with the assistance of others whose help he has scrupulously acknowledged, statistical tables of the kingdoms of France, Russia, and the Netherlands. After finishing his '*Abrégé de Géographie, rédigé sur un plan nouveau*,' which

work has been translated into most of the principal languages of Europe, he quitted Paris in 1832, and settled in Padua, where he died on March 14, 1848.

We have mentioned the works on which Balbi's reputation rests, but he produced several others, among them are:—'*La Monarchie Française comparée aux principaux États de l'Europe*,' 1828; '*L'Empire Russe comparé aux principaux États du monde*,' 1829, and '*The World compared with the British Empire*,' 1830.

(*Nouvelle Biographie Universelle*.)

BA'LBÌ, GA'SPARO, a Venetian merchant and traveller, who lived in the second part of the 16th century. He was a dealer in precious stones, and the business of his trade led him to Aleppo, whence he undertook a journey to India, which lasted several years. On his return to Venice he published an account of this journey, '*Viaggio all' Indie Orientali*,' 8vo, Venice, 1590, which was reprinted in 1600. Balbi's narrative is curious, as it refers to an epoch when India was much less known than it is now, and was in a state very different from the present. The Portuguese were then almost the only European nation trading to India, and their establishments on the coasts were numerous and strong. Those Venetian merchants who ventured so far appear to have been on good terms with the Portuguese, and to have enjoyed security under their protection. Balbi wrote in an unpretending style, which bears marks of his candour as to what he himself saw, and also of his credulity with regard to matters which he knew only from hearsay. He is very minute and exact in every particular of mercantile information; but his statements are scanty with regard to the history and geography of the countries which he visited.

Balbi proceeded from Aleppo to Bir on the Euphrates, and then embarked on the river, which he represents as dangerous, owing to rapids and shallows. He landed on the left bank, at the distance of one day and a half from Baghdad, which he calls New Babylon, and to which city he proceeded by land. From Baghdad he descended the Tigris to Bussora, and there embarked for Ormuz, where the Portuguese had a fort, the sovereign of that barren little island being tributary to them. From Ormuz he proceeded to Diu, another factory of the Portuguese at the entrance of the Gulf of Cambay, and thence to Goa, their chief settlement on the Malabar coast. He gives a full and curious account of the trade in those places, of the various goods brought to the markets, their prices in Venetian currency, the duties, freights, &c. From Goa he went to Cochin, and thence round Cape Comorin to St. Thomas, or St. Thomé, as he calls it, another Portuguese factory. He gives a sketch of the missionaries, and their mode of converting the people at that time, which was quite as much by means of physical as of moral force. At St. Thomé Balbi embarked with several Portuguese merchants for the kingdom of Pegu, where he arrived in the year 1583. His account of that remote country is the most curious part of his narrative. Pegu was then a powerful kingdom; Ava was subject to it, and even Siam was its tributary. The ship in which Balbi was having arrived at Negrais, the goods and passengers were transferred into boats, in which they ascended the river Irawaddi for eleven days, when they arrived at Meccao, and proceeded by land to the capital of Pegu, which was twelve miles east from the river. Balbi represents the town as very large, divided into old and new: the new town was square, surrounded with walls and ditches. A number of large crocodiles were he says kept in the ditches to prevent any one from swimming over. The streets were wide, the houses built of wood, and dirty inside. The king's palace was in the middle of the new town: the old town was occupied by the trading people. The town of Pegu has since been destroyed by the Birmans, who conquered it about the middle of the 18th century, and left standing only the great temple of Shomadoo. Balbi had an audience of the king, who inquired about the traveller's native country, and laughed heartily on being told that it was a republic and had no king. He appears however to have heard something of European politics, for he asked Balbi the name of the sovereign who had recently conquered Portugal (Philip II. of Spain). The king, according to Balbi's account, behaved very graciously to him, and made him a present of a golden cup and several pieces of China damask silk, to the great surprise of the natives. Balbi had brought from India some fine emeralds, which the king purchased at the price set on them by the brokers, and Balbi was paid partly in other precious stones and partly in 'gansa,' or lead pieces, which were the currency of the country. He wished to go on to Ava where the finest relics were to be obtained, but was prevented by a war breaking out between Pegu and Ava. Balbi, after remaining two years in Pegu, set off for Martaban, and there embarked to return to Cochin. At Cochin he was detained seven months before he could get a passage for Ormuz. He tells many curious particulars of the people of the Malabar coast, their superstitions, &c. Balbi returned home by the way of Ormuz, Bussora, Baghdad, and Aleppo. He had left Aleppo in 1579, and returned in 1588.

Balbi seems to have been the first traveller who gave an account of Transgangeitic India. A Latin translation of his narrative is in De Bry's '*Collection of Voyages and Travels to the East Indies*,' Frankfurt, 1590-94.

BALBINUS, DECIMUS CAELIUS, a Roman senator, after being twice consul, was elected emperor by the senate in opposition to the

usurper Maximinus, who was supported by the legions in Germany. Maximinus himself, hearing that the senate had outlawed him, was preparing to march from Illyricum into Italy. Rome was in great consternation. News had reached Rome that the elder Gordianus and his son, who had been proclaimed shortly before in Africa with the approbation of the senate, had both perished there. The senate in this emergency elected two emperors—Clodius Pupienus Maximus, an experienced officer who had risen from a low station to the highest ranks, and Balbinus, a man of fortune and connections, and of a mild conciliatory character: but at the demand of the people and the soldiers, who were attached to the memory of Gordianus, a third emperor, Marcus Antonius Gordianus, a boy of twelve years of age, was also appointed; after which Maximus set off for North Italy to oppose Maximinus, and Balbinus remained at Rome. A serious tumult broke out shortly after in the city, in consequence of two praetorian soldiers, who entered unarmed the senate-house to listen to the discussions, having been stabbed to death by some of the senators, who pretended that they were spies of Maximinus. The praetorian guards rose to avenge the death of their comrades; and the people, on the other side, excited by the senators, ran to attack the praetorians, who defended themselves in their camp, and killed many of the citizens. The people next cut off the conduits that supplied the camp with water; but the praetorians sallied out, repulsed the besiegers, and set fire to a district of the city. The greatest disorder prevailed, when Balbinus, who at first had remained inactive, came out to endeavour to part the combatants; but he was assailed with stones, and wounded. As a last expedient the senators thought of exhibiting to the multitude the boy Gordianus, who was clad in the imperial purple, and lifted upon the shoulders of a tall man. The veneration which both the people and the soldiers felt for the name of Gordianus produced the desired effect, and the tumult was appeased. Meantime Maximinus had laid siege to Aquileia, where he was killed in a mutiny by his own soldiers, who afterwards made their submission to Maximus; and the latter returned to Rome to enjoy a triumph for having, though without much exertion on his part, ended the civil war, A.D. 241. The people of Rome were overwhelmed with joy, but the soldiers were dissatisfied, seeing their influence on the decline; they remembered that Maximinus was an emperor of their own choice, while Maximus and Balbinus were the choice of the senate. A conspiracy was soon organised, and the two emperors, jealous of each other's ascendancy, took no measures for their mutual safety. Choosing the occasion of a public festival, when most of the citizens had gone to witness the celebration of the Capitoline games, the praetorians sallied out to attack the palace of the emperors. Maximus, being informed of this, sent for his trusty Germans; but Balbinus, through some suspicion of the designs of Maximus, opposed the order. The praetorians forced their way into the palace, seized both emperors, whom they dragged ignominiously towards their camp, insulting and tormenting them by the way, and finally put them both to death. They then took the boy Gordianus to their camp, and proclaimed him emperor, A.D. 242. The two murdered emperors were no more talked of, and no punishment was inflicted on the assassins. Balbinus and Maximus reigned little more than one year, during which time they had shown assiduity in their duties, attention to justice and public security, and respect for the authority of the laws. Balbinus was a man of elegant manners and cultivated taste, fond of luxury and refinement, and also a lover of literature: he appears to have been a poet of no mean reputation in his time. His house, inhabited by his posterity, was still existing in the time of Diocletian. (Julius Capitolinus, 'Historia Augusta.')

Brass. British Museum. Actual size.

BALBOA, VASCO NUNEZ DE, was born in Xerez de los Caballeros, in Estremadura, about the year 1475. His family, though belonging to the class of hidalgos (or gentlemen), was not in very affluent circumstances. Vasco in his youth held some office in the house of Don Pedro Portocarrero, lord of Huelva; and in 1501 he accompanied Rodrigo de Bastidas in his voyage of discovery to the New World. It is not known whether Balboa remained with the expedition till the time of the death of Bastidas, or whether he left it before, to settle in Hispaniola (St. Domingo); but in 1510 Balboa was at Salviatierra, one of the settlements in that island, and he was so reduced in circumstances, that he had got considerably in debt. About that time, Alonso de Ojeda and Diego de Nicuesa projected a voyage of discovery, the king having granted them the privilege of colonising and governing all those territories which they might discover from Cape Vela (or de

la Vela), in 12° 5' N. lat., 72° 9' W. long. to Cape Gracias-a-Dios in 15° N. lat., 82° 45' W. long. One of Ojeda's coadjutors, Bachiller Enciso, remained at Hispaniola to load two ships with men and provisions. The governor of Hispaniola had made a law in that island, that no one should quit it before he had paid all his creditors. Balboa, who was anxious to get away from the island, hid himself in a cask in Enciso's ship, and when the vessel was far from land presented himself to Enciso, who, though much irritated at the trick, was at last reconciled by the entreaties of Balboa and his friends.

Enciso, on reaching Cartagena, where Ojeda's party had originally proposed to settle, found that Ojeda had changed his plans in consequence of the hostility of the natives, and had removed to the Gulf of Darien; also that he had sailed thence to Hispaniola in quest of Enciso. In Ojeda's absence, Enciso claimed the chief command; and his men, after some resistance, submitted. He ordered them to proceed to the gulf of Darien; on entering which a violent storm overtook them, and the vessel of Enciso was violently driven against a rock on the coast. The men, 150 in number, saved themselves by swimming, but on reaching the settlement, they found it reduced to ashes. They next attempted to penetrate the country, but met with such resistance from the natives that they were obliged to retire to the coast. In this state of despair Balboa said, "I remember to have seen, when I was on these coasts some years ago, a town situated by the side of a large river on the west side of the gulf: the inhabitants were of a mild character, and did not use poisoned arrows." The party eagerly embraced Balboa's suggestion, that they should proceed in quest of the place and take possession of it. After a very obstinate combat with the Indians, the Spaniards put them to flight, entered the town, and founded a settlement, which they called, in fulfilment of a vow, Santa Maria de la Antigua del Darien, in 8° 20' N. lat. The Spaniards, after their establishment there, began to exchange with the natives goods and trinkets for gold, and had already received to the amount of 12,000 dollars, when Enciso, under pain of death, forbade the exchange of anything for gold. On this his men deposed him, and some of them elected Balboa and Zamudio for their leaders; some were for Enciso; and others, again, were desirous to place themselves under Nicuesa. In the midst of these disputes a ship arrived from Spain with men and provisions for Nicuesa. The captain distributed part of his stores among the settlers; and this circumstance determined the parties in favour of Nicuesa. They accordingly dispatched the vessel in quest of that chief, and found him near Portobello in great distress; he accepted the invitation, but when he came to the settlement he was refused permission to land. He however went on shore secretly in spite of the advice of Balboa, but was seized by order of his adversaries, and placed in a miserable vessel, with seventeen men who chose to follow him. The vessel sailed for Spain, and it is supposed to have been lost at sea.

The parties of Enciso and Balboa now resumed their dispute, and Balboa gained the victory. Enciso was tried, and condemned to imprisonment and the loss of all his property, for having usurped the command of Ojeda, but Balboa was persuaded to grant him his liberty, on condition of his leaving Darien. Balboa now dispatched Zamudio to Spain to give an account of what had taken place, and having sent for the men whom Nicuesa had left at Portobello, he made a successful expedition into the country. On that occasion Balboa became acquainted with a very powerful cacique, who gave him much useful information about his own country, and also about a very powerful and rich state, which, as he said, was six suns, or days, to the south of his own country. This was the first information the Spaniards had of Perú. Balboa and his men returned to Darien, where he found a reinforcement, which Columbus had sent from Hispaniola. The provisions brought by that vessel were soon consumed, and scarcity ensued in consequence of the loss of their harvest. Balboa now sent to Columbus for a fresh supply of provisions and 1000 men, that he might be able to remain in the country without being obliged to destroy the natives, and also to undertake the conquest of the country of which he had received intelligence.

In the beginning of September 1513, Balboa embarked on an exploratory expedition, sailing direct to Coiba, an island near the coast of Veragua, where he left the vessels, and proceeded into the interior. By his prudent policy he won the good will of several tribes of Indians, and after a painful journey of about a month, he arrived on the 29th of September at a mountain, from the summit of which the immense expanse of the Pacific Ocean burst upon his view. Affected at the sight, and falling upon his knees, he thanked the Almighty for having granted him the favour of discovering those immense regions, and then addressed his companions in congratulatory and encouraging terms. They all embraced him, and promised to be faithful to the last moment. He then cut down a large tree, and depriving it of its branches, erected a cross upon a heap of stones, and wrote the names of Fernando and Isabel on the trunks of several trees round about. Descending with his companions to the sea-shore, Balboa, in full armour, having in one hand his sword and the standard of Castile in the other, stood upon the sand until, the tide ascending, the water reached his knees, and then, in the hearing of his companions, declared that he took possession of those seas and regions in the names of the king and queen of Castile. The procedure was formally registered by a notary, in order to insure the validity of the act of possession.

Balboa, after visiting some of the islands in the gulf, returned to Darien, which they reached on the 19th January 1514. The fatigues of the journey brought upon Balboa a dangerous fever.

On arriving at Darien, Balboa gave those who had remained in the colony their proportionate share of the riches acquired in the expedition; he also sent a messenger to Spain, to give an account of his discovery, and devoted himself entirely to the improvement of the settlement. In the meantime Enciso had so excited the feelings of the king against Balboa, that Zamudio, who attempted to exculpate his friend, was ordered to be imprisoned, and was obliged to conceal himself. The government determined to appoint a person to supersede Balboa, and to try him for his rebellion. That commission was given to Pedrarias Dávila, a nobleman. The squadron of Pedrarias, consisting of 1500 men, arrived at Darien in 1514. Such were the reports of his ambition which the enemies of Balboa had spread in Spain, that Pedrarias expected to find him living in the colony in princely state, but on his landing he was astonished to find him dressed like the meanest of his men, directing and assisting some Indians in roofing a house.

Pedrarias in execution of his orders placed Balboa under arrest and brought him to trial. He was acquitted of the murder of Nicuesa, which his enemies had attributed to him, but he was condemned in a heavy fine as damages to Enciso, on paying which he was set at liberty. Pedrarias however kept him without any employment in the colony, the consequence of which was, that, through ignorance of the country and mismanagement, the settlers experienced much distress, and in one month seven hundred men died of sickness and hunger. The new adventurers ranged the country in search of gold, and not finding it treated the poor Indians with great cruelty. Thus the chiefs and tribes who, owing to the prudent and conciliating conduct of Balboa had been exceedingly friendly with the Spaniards, were now changed into their enemies.

In the meantime, the friends of Balboa at home had so exerted themselves in his favour, that they obtained for him, in 1515, the appointment of governor under Pedrarias, of Darien and Coiba. Pedrarias was however unwilling to give Balboa his authority, at which the latter, highly displeased, sent his friend Garabito secretly to Cuba, to procure sixty men, with the view of making a settlement near the Pacific. When Garabito returned, Pedrarias had given to Balboa his rank and title. Garabito lauded his men about twenty miles from Darien, and informed Balboa. The information, secret as it was, reached the ears of Pedrarias, at which he was so indignant, that he ordered Balboa to be imprisoned; but on the entreaties of the Bishop Quevedo, and his own wife, Balboa was released and reconciled to his enemy. This reconciliation was further cemented by the marriage of Balboa with the eldest daughter of Pedrarias, then in Spain. Notwithstanding this apparent reconciliation, Pedrarias kept Balboa at Darien, and was always afraid of employing him. In 1517, Pedrarias, having been unsuccessful in all his attempts to reduce the country, sent Balboa in the direction of Port Careta, with directions to found a colony there, and to build ships, in order to visit some of the islands in the Pacific; but having been subsequently informed by some of Balboa's enemies that he intended going on a voyage of discovery on his own account, Pedrarias dispatched Francisco Pizarro with an armed force to arrest Balboa, who was again tried on the very charges on which he had before been acquitted. Although the judge found him guilty, he recommended him to mercy, in consideration of his services, but the inflexible Pedrarias answered the judge, "If he is a criminal, let him die for his crimes." He was accordingly condemned to be beheaded.

Balboa died with the firmness of a hero, in his forty-second year. Herrera says that Balboa was a tall and graceful man, of a pleasing countenance, with flaxen hair; and that he had an acute understanding, and was possessed of great fortitude. In danger and fatigue he always took the lead, and was the last in enjoying rest and comfort. "He was," says Quintana, "rigid in his discipline, but when his soldiers were sick or wounded, he visited and consoled them as a brother, and he was on many occasions seen to go in pursuit of game, and even to dress it himself, for his sick men."

(Herrera, *Historia General de las Indias Occidentales*, Decada first and second, Quintana; *Vidas de Españoles Ilustres*, tom. ii.; Navarrete, *Coleccion de los Viajes y Descubrimientos de los Españoles desde Años del Siglo XV*, vol. iii. Madrid, 1829.)

BALDI, BERNARDINO, was born at Urbino, June 6, 1553, of a noble family. After having received his early education in his native town he went to Padua, where he studied mathematics, jurisprudence, and the languages, of which last his biographer Affó says he acquired fourteen. His reputation in these branches of learning made him known to Ferrante Gonzaga, lord of Guastalla, who engaged him as a teacher of mathematics, and afterwards made him Abbot of Guastalla, with the Pope's approbation. Baldi discharged the duties of this office with great assiduity and zeal; but in defending the prerogatives, jurisdiction, and immunities of his abbey, he found himself entangled in disputes with the community and lay authorities of Guastalla, and with the prince himself. Annoyed perhaps at these controversies, he repaired to Rome, where Cardinal Cuntio Aldobrandini, nephew of Pope Clement VIII., became his friend, and invited him to live in his house. Baldi resigned the abbacy of Guastalla, retaining an annual pension

from its income. Having returned to Urbino, the Duke Francesco Maria della Rovere sent him, in 1612, as his envoy to Venice, to congratulate the new Doge Andrea Memmo. On this occasion Baldi pronounced an elegant oration before the Venetian senate, which so pleased the doge that he presented the orator with a massive gold chain of considerable value. He died at his native place, October 12, 1617.

Baldi wrote a vast number of works in prose and verse, the greater part of which remain inedited. Among those published are a poem on navigation, and several eclogues, which are not without merit. He painted the Italian rustics as rustics generally are, describing their habits and employments, and deriving a moral from their contentedness and their humble enjoyments. Baldi wrote also a poem called 'Deifobe,' purporting to be a chronicle of the vicissitudes of Rome from its foundation to the epoch in which he lived, in the form of a prophecy. Of Baldi's prose works we have several dialogues—one on 'dignity;' and another on the qualities and duties required of a prince, written with considerable freedom, considering the age and country in which he lived. He also compiled a short chronicle of all the mathematicians known from Euphorbus (mentioned by Diogenes Laertius in his 'Life of Thales') down to his own time; and he published two Latin works in illustration of Vitruvius—'Scamilli Impares Vitruviani a Bernardino Baldo nova ratione explicati,' Augsburg, 1612; and 'De Verborum Vitruvianorum Significatione,' *ibid.*, with a life of Vitruvius. Both have been inserted by the Marquis Poleni in his 'Exercitationes Vitruvianae,' Padua, 1741. Two historical works of Baldi were recently published for the first time—'Vita e Fatti di Guidobaldo I. di Montepetro Duca d'Urbino,' 2 vols., Milano, 1821; and 'Vita e Fatti di Federico di Montepetro Duca d'Urbino,' 3 vols., Roma, 1824. He is likewise said to have prepared an Arab and a Persian grammar, a Turkish vocabulary, and a translation of the geography of Edrisi, and another of a Chaldean commentary on the Targum of Onkelos, the results of his assiduous study of the Eastern languages, to which in the prime of his life he for a short time devoted much labour.

(Affó, *Vita di Bernardino Baldi*.)

BALDINI, BA'CCIO, a Florentine goldsmith and engraver, who flourished in the second half of the 15th century. He was one of the first Italian engravers, whose works on that account have an historical interest, but are otherwise of little value. Baldini was bred a goldsmith, and was taught engraving by Finiguerra himself, who was the inventor of the art according to the Italians. Baldini however, though acquainted with the art, could derive no benefit from it, as he was incapable of making a design; he communicated it therefore to Alessandro Botticelli, and the two entered into partnership—the one designed and the other engraved. Such is the story of Vasari. The first prints published in Italy are those of the books entitled 'Il Monte Santo di Dio,' by Fra. Antonio di Siena, printed in 1477; and of an edition of Dante, with the commentary of Landini, published in 1481: both were printed at Florence by Niccolo di Lorenzo. In the 'Monte Santo' there are three engravings by Baldini, and for the Dante he engraved 19, but only two were ready when the book was published; the remaining 17, in the Vatican copy, have been pasted on the blank places left for them. Niccolo di Lorenzo left a blank place for a print at the head of every canto. Baldini executed many other prints, which are noticed at length by Bartsch and other writers on prints. Heineken, Strutt, and others have published copies of some of Baldini's engravings as specimens of the early Italian style. According to Duchesne ('Essai sur les Nielles'), Baldini also executed numerous works in niello. (Vasari, *Vite di Pittori*, &c., in the 'Life of Marcantonio'; Strutt, *Dictionary of Engravers*; Heineken, *Nachrichten von Künstlern*; Bartsch, *Le Peintre-Graveur*.)

BALDUNG, HANS, called also Hans Grün, a celebrated old German painter and wood-engraver, the contemporary and the friend of Albert Dürer. He was born at Gmund, in Swabia, about 1470, or a few years later, but lived chiefly in Switzerland, at Strasbourg, and its neighbourhood. From the inscription upon a picture of the Crucifixion, in the church of Freiburg in Breisgau, which is considered his masterpiece, his full name appears to have been Hans Baldung Grün or Grien. It is painted upon canvass glued upon wood. His woodcuts are variously signed H. B., H. B. G., and H. G. His prints are rather numerous. Bartsch mentions two engravings on copper, and 59 woodcuts; and Brulliot states that there are still many which have been overlooked by Bartsch. Baldung's latest cuts bear the date 1534. The earliest date of his cuts appears to be 1507. His latest works are the best.

As a painter he was little inferior to Albert Dürer in expression, in colouring, or in finish. He painted portraits and history, sacred and profane: the heads are the best parts of his works. The year 1545 is given in several works as the year of his death. There is in the gallery of Carlsruhe a book of studies and portraits by him.

(Füssli, *Allgemeines Künstler-Lexicon*; Heineken, *Dictionnaire des Artistes*, &c.; Bartsch, *Le Peintre-Graveur*; Brulliot, *Dictionnaire des Monogrammes*, &c.; Nagler, *Neues Allgemeines Künstler-Lexicon*.)

BALDWIN, or BAUDOUIN, great forester of Flanders, succeeded, A.D. 837, his father Andacer in the government of that province, as feudatory of the Emperor Louis, Charlemagne's successor. Baldwin was called 'Iron-arm,' on account of his great strength; some say, on account of his being constantly in armour. Upon the death of Louis,

in 840, Baldwin, having taken the part of Lotharius against his brothers, was severely wounded in the battle of Fontenai. Shortly after, Judith, daughter of Charles the Bald, King of Aquitania and of Neustria, having become a widow, by the death of her husband Ethelwolf, king of England, was returning to her father in France, when Baldwin, who had heard of her great beauty, went to meet her at her landing. He prevailed on her to accompany him to the castle of Haerlebeck, where they were privately married, as they had no expectation of obtaining her father's consent. Charles incensed at the news, sent his son, Louis the Stammerer, to make war upon Baldwin, who defeated him near Arras. After the battle, Baldwin caused several of Charles's barons, whom he had taken prisoners, to be hanged, as the instigators of the war. The pope, Nicholas I., having excommunicated him, at the request of Charles the Bald, Baldwin made a journey to Rome with his wife Judith, and not only obtained absolution, but succeeded in engaging the good offices of Pope Nicholas I., who sent a legate to Charles of France, and effected a reconciliation. Baldwin and his wife repaired to the court of Charles, who received them kindly, and enlarged the limits of Flanders, erecting it into a county, in 862. Baldwin built castles at Bruges and Ghent, to defend the country against the Normans, who, under their chief Hastings, had landed on the coast. Baldwin died at Arras in 877.

BALDWIN II., Count of Flanders, son of the above, married Alfrith, daughter of Alfred of England. He made war against Eudes, count of Paris, who had usurped the French crown, and defeated him. He had also disputes with Charles the Simple, the rightful heir, after the latter had ascended the throne. Baldwin died in 919, and was succeeded by his son Arnoul.

BALDWIN III., styled 'of the handsome beard,' succeeded Count Arnoul the younger in 938, and died in 1034. He married a daughter of the Count of Luxemburg. During the troubles that followed the death of the Emperor Otho III., the Count of Flanders seized upon several places in the neighbourhood of his territories: among others, upon Valenciennes, which he afterwards defended against the united forces of the Emperor Henry, King Robert of France, and the Duke of Normandy. It was finally agreed at last that he should retain Valenciennes, as an imperial feud, as well as the island of Walcheren and other parts of Zealand. Baldwin then obtained the hand of Adele, daughter of Robert of France, for his son Baldwin. An assembly of the prelates and nobles of Flanders, held at Oudenarde, by Count Baldwin III., appears to be the first mention made of the states of Flanders.

BALDWIN IV., called by some 'of Lisle,' and by others 'le Débonnaire,' was the son and successor of Count Baldwin III. He conquered from the German territory several districts on the right bank of the Scheldt, which he retained on condition of doing homage to the emperor for the same; and thus the counts of Flanders were vassals of both the crowns of France and Germany. Baldwin gave his daughter Mathilda to William of Normandy, afterwards king of England. Henry I. of France, at his death, appointed Count Baldwin guardian to his son Philip, then a minor. Baldwin fulfilled his trust with great honour; and defeated the Gascons, who had revolted. He then accompanied his son-in-law, William, to the conquest of England; and for his services on that occasion William assigned him and his successors a yearly pension of 300 marks of silver out of the English treasury. Baldwin died in 1067, and was buried at Lisle.

BALDWIN V., called 'the Good,' and also 'of Mons,' from his having married the Countess Richilda, of Hainault, who brought him the lordship of Mons before he became Count of Flanders, succeeded his father, Baldwin IV. He died in 1070, leaving two sons, Arnoul and Baldwin. After his death, his brother Robert, called the Frieslander, from having conquered the principality of Friesland, invaded Flanders, and defeated his nephews and Philip of France, who had come to their assistance, in a battle near St. Omer. Arnoul was killed; and Baldwin, after a time, renounced his claims on the county of Flanders in favour of his uncle and his descendants, and kept for himself the county of Hainault, which he had inherited from his mother. This Baldwin has been reckoned in the series of the princes of his family as Baldwin VI.

BALDWIN VII., grandson of Robert the Frieslander, succeeded his father, Robert the younger, as Count of Flanders, in the year 1111. He was called Baldwin Hapkin, from the name of a kind of axe used during his reign in the numerous public executions of the outlaws who infested the country, among whom were many turbulent feudal lords. Baldwin made war in Normandy in favour of William, son of Robert Curthose, against Henry I. of England; and being severely wounded at the siege of Rouen, died soon after, in 1119. He was succeeded in the county of Flanders by his cousin Charles of Denmark.

BALDWIN VIII., Count of Hainault, was descended from Baldwin VI., and became Count of Flanders after the death of Count Philip, in 1194. Thus the line of Baldwin of Mons was restored, and the two counties of Hainault and Flanders were re-united. Philip of France, afterwards Philippe Auguste, married Isabella, Baldwin's daughter. Baldwin died in 1195, leaving his dominions to Baldwin IX., afterwards Emperor of Constantinople. (*Oudeghorst, Chroniques et Annales de Flandre.*)

BALDWIN I., Emperor of Constantinople, was the son of Baldwin of Hainault, and of Margaret countess of Flanders. He became count of Flanders by the death of his mother in 1194, and the following year succeeded his father as count of Hainault. Soon after his accession he made war upon Philip II. of France for the recovery of the province of Artois, which had been detached from Flanders under count Philip his uncle, and with the help of Richard of England succeeded in recovering a portion of the Artois, which he retained by the treaty of Peronne in 1199. In 1200, Baldwin having resolved to join the fourth crusade, appointed his brother Philip, count of Namur, with other persons, to the regency of Flanders and Hainault. Baldwin's wife, Mary of Champagne, followed him to Venice, the appointed rendezvous of the Crusaders. As the sum for which the Venetians engaged to furnish ships and provisions was more than the Crusaders could pay, Baldwin exhorted his brethren in arms to part with their private money, their jewels, and ornaments, and he set them the example himself. Still a large sum being wanting, Dandolo, the doge of Venice, proposed that, on their way to the East, the Crusaders should stop before Zara in Dalmatia, and assist the Venetians in reconquering that place, which had revolted, and given itself up to the king of Hungary. Many of the Crusaders refused and left Venice: others, of whom Baldwin was one, agreed to the proposal. The fleet sailed in October 1202, and having stopped at Zara, the Crusaders and the Venetians took the town, where they wintered. At Zara the Crusaders were applied to by messengers from Alexius, son of Isaac Angelus, emperor of Constantinople, who had been deposed, had his eyes seared out, and been thrown into a dungeon by his brother Alexius III. The young Alexius implored the Crusaders to deliver his father, and restore him to the throne, engaging, on his part, to give them afterwards every assistance for the recovery of Palestine, to pay them a large sum of money, and to make the Greek Church acknowledge the supremacy of the Roman See. At a great consultation, held by the chiefs of the Crusaders, Boniface, marquis of Montferrat, Baldwin of Flanders, and the old Doge Dandolo, supported the entreaties of Alexius, and the expedition to Constantinople was resolved upon. They then proceeded to Corfu, where they were joined by young Alexius himself. In May 1203 the fleet, consisting of nearly 500 sail, left Corfu, and steered for the Hellespont; they entered the Propontis without meeting any opposition, and cast anchor at Chrysopolis, opposite to Constantinople. The plan of attack being formed, Baldwin, who had with him the best archers and a numerous body of brave knights, was appointed to lead the van. A rapid succession of events occurred; the Greek forces were defeated near Galata; Alexius the usurper fled, and Isaac was restored to the throne. Young Alexius finding some difficulty in fulfilling all the promises he had made, the Crusaders became impatient, and hostilities broke out between them in January 1204. At the same time a revolution took place in the city. Young Alexius Angelus was murdered, and his father, the Emperor Isaac, died, it was said, of terror and grief. The throne was usurped by Alexius Duca, called Murtzufos. The city was now invested by the Crusaders, who, after a siege of three months, made a general assault, the city being stormed from the harbour side. A dreadful slaughter ensued, much of which was perpetrated by the depraved part of the town population. The booty was divided between the Crusaders and the Venetians; the share of the former, after deducting their debt to the republic, amounted to 400,000 marks of silver. The Latin conquerors appointed twelve electors, six Venetians, and six Crusaders, to choose a new emperor of the East. The Crusaders proposed at first the gallant old Doge Dandolo, but the Venetians objected to his nomination, on the ground that the imperial dignity was incompatible with that of first magistrate of their republic. The choice then fell upon Baldwin of Flanders, the most distinguished as well as the most powerful of the Crusaders. The authority of Baldwin however was much circumscribed: not more than one-fourth part of the provinces of the empire was appropriated to him, part of the remainder being allotted to the Venetians, whose doge was proclaimed Despot of Romania; and part was distributed among the adventurers of France and Lombardy, while several provinces remained in the possession of Greek princes, the relatives of the former emperors. Baldwin was therefore rather a titular than a real emperor, and all his abilities and good intentions, for which historians have generally given him credit, could not prevent the disorders inherent to such a state of things. Many of the Greeks were of course dissatisfied with the new arrangements, and their discontent being abetted by John, or Joannices, king of the Bulgarians and Wallachians, a vast conspiracy was formed, and as soon as Henry, Baldwin's brother, had crossed over to Asia on an expedition, taking with him the flower of his troops, the Greeks of the towns of Thrace rose and massacred the Latins who were scattered among them. Baldwin went out to meet Joannices, who had crossed the Balkan, but he was defeated and taken prisoner on the 15th of April 1205. Villehardouin, the marshal of Romania, who has left a history of the whole expedition, and the old Doge Dandolo, effected a gallant retreat with the scanty remainder of their troops. Baldwin died a prisoner of the Bulgarians in the following year. Innocent III. having written to Joannices, requesting him to give up the emperor, was answered that "Baldwin had paid the debt of nature." The manner of his death is unknown. Various

stories were circulated respecting the way in which he had been put to death, but none of them appear deserving of much credit. Henry, Baldwin's brother, succeeded him as emperor of Constantinople. Twenty years after a hermit appeared in Flanders, pretending that he was Baldwin, but he was convicted of imposture and put to death. Mary, Baldwin's wife, died before her husband on a pilgrimage to Jerusalem. Two contemporary historians, of the two opposite parties, have each left us an account of the memorable events connected with the conquest of Constantinople by the Crusaders; one is Villehardouin of Champagne above-mentioned, and the other Nicetas, a Greek, who held a high rank in the imperial court. (Nicetas, books xix. xx. xxi.) There are also letters from Baldwin, inserted in the *Gesta Innocentii III.* (Lebeau, *Histoire du Bas Empire*; Ducange; the Venetian historians; Gibbon, ch. 60.)

BALDWIN II. was the son of Peter de Courtenay, count of Auxerre, and of Yolande, sister of Baldwin I., the emperor, and was born in 1217. After the death of Henry, Baldwin's brother and successor in 1217, Peter de Courtenay was called to the imperial throne; but Peter never reached his destination, being treacherously arrested in Epirus by Theodore Angelus, the despot of that country. He died in captivity, but the manner of his death is unknown. His second son Robert, who was called to succeed him on the imperial throne, died in 1228. His brother Baldwin being yet a child, the barons of Romania called to the throne John of Brienne, titular king of Jerusalem, on condition that young Baldwin should marry his daughter and become his colleague and successor. John of Brienne died in 1237, and was succeeded by Baldwin. The empire of the Latins might be said to be now confined to the walls of Constantinople, and Baldwin had neither money nor abilities to retrieve his fortunes. After visiting Rome and France in the vain hope of inducing the Pope and Louis IX. to afford him aid, and wasting years of humiliating reverses and fruitless negotiations, he (in July 1261) was surprised within his capital by the troops of Michael Palæologus, who ruled over the Greeks of Asia Minor as well as of Thrace. Michael was proclaimed emperor by the multitude, and Baldwin had just time to escape by sea to Eubœa, and thence to Italy. With him ended the dynasty of the Latin emperors of Constantinople. In his exile, Baldwin continued to retain the title of emperor, and it was used by his descendants till the close of the 14th century. The last of these titular emperors of Constantinople was James de Baux, duke of Andria in the kingdom of Naples, who was descended from Baldwin II. by his mother's side. (Gibbon, ch. 61, and his authorities; Du Bouchet, *Histoire de la Maison de Courtenay*, &c.)

BALDWIN I., King of Jerusalem, was the son of Eustace, count of Bouillon, a feudal territory in the Ardennes, and of Ida of Lorraine. He accompanied his two elder brothers, Godfrey, duke of Lower Lorraine or Brabant, and Eustace, count of Boulogne, to the first crusade in 1096. Baldwin distinguished himself in several actions against the Turks of Asia Minor, and took Tarsus in Cilicia. On the invitation of the Christian inhabitants of Edessa, who were tributaries to the Turks, he entered Mesopotamia, and was well received by the Edessans, who soon after proclaimed him their lord. Upon this Baldwin assumed the title of Count of Edessa, which county continued in the hands of the Christians for about half a century. After extending the limits of his territory by fresh conquests, he joined the rest of the Crusaders in attacking the Turks of Aleppo, but soon after returned to Edessa, while the main army advanced against Jerusalem in 1099. After his brother Godfrey had been elected king of Jerusalem, Baldwin repaired with a large retinue to the Holy City, and after having visited the sanctuaries returned to Edessa. In the following year (1100) Godfrey died, and Baldwin being called to succeed him, resigned the county of Edessa to his cousin Baldwin du Bourg, and repaired to Jerusalem, where he was crowned on Christmas-Day 1100. His reign, which lasted till 1118, was one of continual warfare against the Turks, the Arabs, the Persians, and the Saracens of Egypt, in which Baldwin displayed much bravery and perseverance, and indefatigable activity. He obtained several victories, taking the towns of Acre, Tripoli in Syria, Sidon, Ascalon, and Rhinocolura, thus securing for the Christians possession of all the coast of Syria, from the Gulf of Issus to the frontier of Egypt. Baldwin, intending to carry the war into Egypt, advanced as far as Rhinocolura, which he took, but proceeded no farther. On his return towards Jerusalem he was taken ill, and died at Laria, in the Desert, in March 1118. Baldwin was a very different character from his brother Godfrey, who was a sincere enthusiast, pure and disinterested. Baldwin was ambitious and worldly, but at the same time brave, clever, and firm. Tasso, in the first canto of his 'Gerusaleme' (ct. 8-9), has faithfully portrayed the character of the two brothers. (For the events of the first Crusade, and the reigns of Baldwin and his successors, see William of Tyre, Gibbon, and Michaud, *Histoire des Croisades*.)

BALDWIN II., or Baldwin du Bourg, count of Edessa, succeeded his cousin Baldwin I. on the throne of Jerusalem, when he resigned the county of Edessa to Jocelyn of Courtenay. Under his reign the military and religious order of the Templars was instituted for the defence of the Holy Land. The order of St. John of Jerusalem had been instituted many years before for pious and charitable purposes; but it also now assumed a military character. Baldwin's reign, like

that of his predecessor, was one of almost constant warfare against the Turks, Arabs, and Egyptian Saracens. In 1123 he went to the relief of Edessa, which was attacked by the Turks, who had taken Jocelyn of Courtenay prisoner. Baldwin was surprised by the Turks, and taken also. Jocelyn however found means to escape, defeated the Turks, and obtained Baldwin's release on his paying a ransom. Baldwin abdicated the crown in favour of his son-in-law, Foulques of Anjou, in 1131, and retired to the monastery of the Holy Sepulchre where he soon after died.

BALDWIN III., the son of Foulques of Anjou, was born in 1130, and succeeded his father in 1142. Under his reign the Christians lost Edessa, which was taken by storm in 1145 by Zenghi, Turkish prince of Aleppo, and father of the famous Nouredin. Baldwin had to struggle during the greater part of his reign with the power and abilities of Nouredin, of whom he was sometimes the enemy and sometimes the ally against the Fatimite sultans of Egypt, who were perpetually at war with the Abbaside kalifs of Baghdad, to whom Nouredin bore allegiance. [NOUREDDIN.] Louis VII. of France, and Conrad III., emperor of Germany, undertook the second crusade in 1147, at the exhortation of St. Bernard, for the purpose of supporting their Christian brethren of Palestine. In this expedition they lost the greater part of their men in their march through Asia Minor; and having reached Palestine with the remainder, they joined Baldwin's forces in an attempt upon Damascus, in which they failed. Conrad and Louis then returned to Europe. Baldwin married Theodora, the niece of Manuel Comnenus, emperor of Constantinople. He died February 23, 1162, with suspicious symptoms, after having taken some medicine from a Jewish physician at Antioch. He was succeeded by his brother Amaury, or Amalric.

BALDWIN IV., son of Amaury, was born in 1160, and succeeded his father in 1174. He was afflicted with leprosy and nearly blind, yet in this distressed state he had to encounter the might of Salaeddin, who had succeeded Nouredin, and had extended his power over both Egypt and Syria. Baldwin however, after suffering several defeats, obtained a truce from Salaeddin. He died in 1186, leaving for his successor his nephew Baldwin, then a child, the son of his sister Sybilla and of her first husband, the Marquis of Montferrat. This Baldwin, who has been styled Baldwin V., died seven months after his uncle, and it was suspected, by poison administered by Guy de Lusignan, Sybilla's second husband, who next became king. Soon after Guy's assumption the Christians lost Jerusalem, which was taken by Salaeddin in 1187.

BALDWIN, Archbishop of Canterbury in the reigns of Henry II. and Richard I. This prelate was born of obscure parents at Exeter, where he received a liberal education, and in his younger years taught school. Having entered into holy orders, he was made archdeacon of Exeter, but soon resigned this dignity, and became a monk in the Cistercian abbey of Ford, in Devonshire, of which in a few years he was elected abbot. In 1180, he was promoted to the bishopric of Worcester; and in 1184 Henry II. translated him to the see of Canterbury. Baldwin had not been long settled in the see when he began to build a church and monastery at Heckington, near Canterbury, in honour of St. Thomas à Becket, intending it for the reception of secular priests; but the opposition of the monks of his cathedral, supported by the authority of successive popes, caused him ultimately to desist, and even to destroy the buildings which he had erected. Urban III. afterwards made Baldwin his legate for the diocese of Canterbury. On September 3, 1189, Baldwin performed the ceremony of crowning Richard I. at Westminster; and in the same year, when that king's natural brother, Geoffrey, was translated from the see of Lincoln to York, he successfully asserted the pre-eminence of the see of Canterbury, forbidding the bishops of England to receive consecration from any other than the archbishop of Canterbury. In 1190 he made a progress into Wales, to preach the crusade; and in the same year, having held a council at Westminster, he followed king Richard I. to the Holy Land. He embarked at Dover, March 25, 1191, abandoning the important duties of his station, and, after suffering many hardships on his voyage, arrived at Acre during the siege, where he died, November 20, in the same year, and where his body was interred.

Giraldus de Barri, or Cambrensis, who accompanied Archbishop Baldwin not only in his progress through Wales, but to the Holy Land, tells us he was of a dark complexion, an open and pleasant aspect, a middling stature, and a spare but healthful constitution of body; modest and sober, of great abstinence, of few words, and not easily provoked to anger. The only fault he charges him with is a remissness in the execution of his pastoral office, arising from an innate lenity of temper. Bishop Tanner has given a list of a great many treatises by Archbishop Baldwin, which remain in manuscript, and has noticed the different libraries in which they are deposited. The most important were collected by Bertrand Tisserot, and published, in 1662, in the fifth volume of the 'Scriptores Biblioth. Cisterciensis.'

(*Biogr. Brit.*, edit. 1778, p. 530; *Mat. Par.*, edit. 1640, pp. 141, 143, 154, 157, 161; *Henry, Hist. Brit.*, 8vo, edit. 1805, vol. v. pp. 403, 423; *Pits, De Illustr. Angl. Script.*, an. 1193; Wharton, *Anglia Sacra*; *Gervas. Act. Pontif.*)

BALE, JOHN, in Latin BALÆUS, Bishop of Ossory in Ireland, was born at Cove, a small village in Suffolk, about five miles from Dunwich, November 21st, 1495. When he was twelve years of age he was placed

in the monastery of Carmelites at Norwich, whence he was afterwards sent to Cambridge, and entered of Jesus College. In 1529 he is mentioned as prior of the Carmelites of Ipswich. (Strype, 'Annals,' Append., No. 25.) His education, of course, was in the Romish religion; but sometime subsequent to 1529, at the instigation of the Lord Wentworth, he turned Protestant, and gave proof of having renounced one, at least, of the rules of the Catholic religion (the celibacy of the clergy) by immediately marrying. This, as may be conjectured, exposed him to the persecution of the Romish clergy, against whom however he was protected by the Lord Cromwell. An original letter from Bale to Lord Cromwell occurs in the Cottonian volume ('Cleop.,' E. iv. 134), complaining of poverty, persecution, and imprisonment, and asking favour and deliverance, in which he styles himself doctor of divinity and "late parych prest of Thornden in Suffolk." After Cromwell's death, Bale retired to the Low Countries, where he remained eight years, busying himself chiefly with his pen. He was then recalled into England by king Edward VI., and obtained the living of Bishopstoke in Hampshire, and in 1552 the bishopric of Ossory. Bale's zeal for the Protestant religion rendered him so unpopular, that upon the arrival of the news of Edward VI.'s death, his life was endangered: five of his servants were killed by the kernes, who attacked his house at Holmes Court, near Kilkenny; and he himself was obliged to be escorted to Dublin by a hundred horse and three hundred foot soldiers. Here also he found himself insecure, and being assaulted in Dublin by the Roman Catholics, he at last made his escape on board a trading vessel of Zealand in mariner's apparel. After being captured and plundered by a Dutch man-of-war, and running several risks, he got at last to Holland, where he was kept a prisoner three weeks, and then obtained his liberty on the payment of thirty pounds. From Holland he retired to Basle in Switzerland, and continued abroad during the short reign of Queen Mary. On the accession of Queen Elizabeth he returned to England, but not to his bishopric in Ireland; preferring a private life, and contenting himself with a prebend in the cathedral church of Canterbury, to which he was promoted on the 1st of January, 1559-60. ('Rym. Fœd.,' tom. xv. p. 563.) He died in November, 1563, in the sixty-eighth year of his age, at Canterbury, and was buried there in the cathedral.

Bishop Bale's fame now principally rests on his valuable collection of British biography, first published under the title of 'Illustrium Majoris Britannie Scriptorum, hoc est, Angliæ, Cambriæ, et Scotiæ, Summarium,' 4to, 1548. He has himself in this very work preserved a long list of his other writings, in Latin, which Fuller has translated in his 'Abel Redivivus.' Bale divided them into, 1, those which he had compiled while yet a papist; 2, those which he wrote after he had renounced popery; 3, his comedies in English, in various kinds of verse; 4, his works in English in prose: adding that he had written and translated many others which he could not bring to recollection. The subjects only however of his writings are enumerated in this list, and not their actual titles, so that it is impossible to ascertain distinctly from it which among them are his printed works, and which were those remaining in manuscript.

The following is the list of Bale's printed works, with their successive editions, as far as they have been discovered. They are, most of them, very rarely met with:—

1. 'A new Comedy or Interlude, concerning thre Lawes, of Nature, Moyses, and Christie,' 8vo, Lond. 1538, 4to, Lond. 1562.
2. 'A brief Comedy or Interlude, concernyng the Temptatyon of our Lord,' 8vo, 1538.
3. 'A Tragedie or Enterlude manifesting the chief Promises of God unto Man,' 8vo, Lond. 1538, 4to, 1577.
4. 'Yet a Course at the Romyshe Foixe,' against Edmond Bonner, Bishop of London (under the name of John Harrison), 16mo, Zürich, 1543.
5. 'A breffe Chronycle concerning the Examination and Death of Sir John Oldcastell,' Lord Cobham, 8vo, Lond. 1544; 12mo, Lond. W. Seres, n.d. 8vo, Lond. 1576 and 1729.
6. 'A Mystery of luiquyte contayned within the Heretical Genealogye of Ponce Pantolabus,' 16mo, Geneva, 1545.
7. 'The Actes of Englysh Votaryes,' 1st part, 8vo, Wesel, 1546, 8vo, Lond. 1548; first two parts, 12mo, 1550, 1551, 1560. (No more parts were published.)
8. 'The true Hystorie of the Christen Departyng of the Reverend Man D. Martyn Luther,' translated from the Latin of Justus Jonas, Michael Celius, and Johannes Aurifaber, 8vo, Lond. 1546.
9. 'The first Examination of Anne Askewe, lately martyred in Smithfield,' 8vo, Marpurg in Hesse, 1546.
10. 'The lattre Examination of Anne Askewe,' 8vo, Marp. 1547.
11. 'A brife and faythfull Declaration of the true Fayth of Christ,' 16mo, Lond. 1547.
12. 'Illustrium Maioris Britannie Scriptorum, &c. Summarium, in quosdam Centurias divisum,' 4to, Wesel, 1548 (at the end, 'Gippeucii in Anglia,' 1548), Five Centuries, fol. Bas. 1557; Nine Centuries, fol. Bas. 1559, with a second part, carrying the work on to fourteen centuries. A copy of the edition of 1548, corrected by Bale's own hand, is preserved in the library of the British Museum.
13. 'The laboriouse Journey and Serche of Johan Leylande for Englands Antiquities,' 16mo, Lond. 1549, reprinted in the 'Life of Leland,' 8vo, 1772.
14. 'A Dialogue or Communycation to be had at a Table betwene two Chylidren, gathered out of the Holy Scriptures by John Bale for his two yonge Sonnes, Johan and Paule,' 8vo, Lond. 1549.
15. 'The Confession of the Synner after the Sacred Scriptures,' 8vo, Lond. 1549.
16. 'The Apology of Johan Bale against a rauke Papyt,' 8vo, Lond. 1550.
17. 'The Image of both Churches, 2 parts, 8vo, Lond. J. Daye; 3 parts,

- 8vo, Lond. T. East (1550); 8vo, Lond. 1584.
18. 'An Expostulation or Complaynte against the Blasphemyes of a frantic Papyt of Hamshyre,' 8vo, Lond. 1552; another edition, 1584.
19. 'The Vocacyon of Johan Bale to the Bishoprick of Ossorie in Irelande, his Persecutions in the same, and finale Delyverance,' 12mo, Lond. 1553.
20. 'A Declaration of Edmonde Bonner's Articles concerning the Cleargye of London Dyocesse,' 8vo, Lond. 1561.
21. 'Acta Romanorum Pontificum a dispiratione Discipulorum Christi usque ad tempora Pauli quarti, ex Joannis Balæi Catalogo Anglicorum Scriptorum desumpta,' 8vo, Francof. 1567; 8vo, Leyd. 1615.
22. 'The Pageant of Popes,' translated from the Latin of Bale, by I. S. (John Studley), 4to, Lond. 1574. Bale also himself translated Baptist Mantuan's 'Treatise on Death,' 8vo, Lond. 1584. In 1548 he prefixed an epistle dedicatory to the Princess Elizabeth's translation of the 'Meditations of Margaret, Queen of Navarre,' published at London, 8vo, in that year. Wood ('Athen. Oxon.,' edit. Bliss, vol. iii., col. 435) says Bale translated Polydore Virgil's work 'De Rerum Inventoribus' in the time of Edward VI., but in old and rude English. He does not say whether this translation was published.

Fox tells us ('Acts and Monuments,' 1st edit., p. 574) that Bale wrote several books under the name of Harrison. Bale's father's name was Henry Bale, and on that account perhaps Bale assumed the name of Harrison. His 'Collectanea' (in his own handwriting) 'de Religione Carmelitana, et Scriptoribus ejusdem,' 4to, is still preserved among the Harleian Manuscripts in the British Museum, No. 1819.

No character has been more variously represented than Bale's. Gesner, in his 'Bibliotheca,' calls him a writer of the greatest diligence, and Bishop Godwin gives him the character of a laborious inquirer into British antiquities. Similar praise is also bestowed upon him by Vogler. ('Introd. Universal. in Notit. Scriptorum.') Anthony à Wood however styles him 'the foul-mouthed Bale.' Hearne ('Pref. to Hemingf.') calls him 'Balæus in multis mendax.' And even Fuller ('Worthies,' last edit. vol. ii., p. 332) says "Bilioeus Balæus passeth for his true character." He inveighed with so much asperity against the Pope and papists that his writings were prohibited by the Church of Rome among those of the first class of heretical books; and his intemperate zeal, it must be acknowledged, often carried him beyond the bounds of decency and candour. Fuller, in his 'Church History,' cent. ix. p. 68, pleads for Bale's railing against the papists. "Old age and ill usage," he says, "will make any man angry. When young, he had seen their superstition; when old, he felt their oppression. The best is, Bale rails not more on Papists than Pits (employed on the same subject) on Protestant writers; and even set one against the other, whilst the discreet reader of both, paring of the extravagances of passion on each side, may benefit himself in quietness from their loud and clamorous invectives." The greatest fault of Bale's book on the British writers is its multiplication of their works by frequently giving the heads of chapters or sections of a book as the titles of distinct treatises. He has likewise put many persons down as authors who had no claim to such distinction.

BALECHOU, JEAN JACQUES, a very celebrated French engraver, born at Arles in 1715. After having practised some time in the establishment of a seal-engraver at Avignon he went to Paris, and placed himself under the guidance of Bernard L'Epicié. Soon after commencing to engrave on his own account he acquired great celebrity, and his works are still eagerly sought after by collectors: his chief merit however consists in his mastery of the graver. In the representation of the natural appearances of objects, or in the imitation of textures, he has been surpassed by many artists.

Balechou engraved both portraits and landscapes. Among the latter are three from Joseph Vernet, of which the Storm and Calm are very celebrated prints, and they deserve their celebrity. Of his portraits, Balechou's masterpiece is the large upright print of Augustus III., king of Poland, after the picture by Rigaud. It forms the frontispiece to the 'Recueil d'Estampes après les plus célèbres Tableaux de la Galerie de Dreade.' It was however the cause of Balechou's disgrace at Paris, for he retained some of the impressions, and even damaged the plate before he sent it to the king, at whose expense it was engraved. His right of election to be a member of the French Academy of Painting, of which he was agrée, equivalent to our degree of associate, was forfeited in consequence, and he retired to Avignon, where he died in 1764.

(Heineken, *Dictionnaire des Artistes*, &c.; Watelet et Levesque, *Dictionnaire des Arts*, &c.; Huber, *Manuel des Amateurs*, &c.; Strutt, *Dictionary of Engravers*.)

BA'LEN, HENDRIK VAN, a distinguished Flemish historical painter, and the first master of Vandyck and Snyders, was born at Antwerp in 1560. He went early to Rome to study his profession, having acquired the rudiments from Adam van Oort. He was an excellent colourist, a good draughtsman, and painted with great facility. Of his paintings, which are numerous, one of the best is the St. John in the Wilderness, an altar-piece in one of the chapels of the cathedral of Antwerp: the background is by Velvet Breughel, who painted the landscape backgrounds of many of Van Balen's pictures. He died in

1632, and was buried in the church of St. Jacques at Antwerp. Vanduyck painted his portrait, and it has been engraved by Paul Pontius. The painter, Jan Van Balen, was the son of Hendrik. (Van Mander, *Leven der Schilders*; Descamps, *La Vie des Peintres Flamands*, &c.; Heineken, *Dictionnaire des Artistes*, &c.)

BALESTRA, ANTONIO, a distinguished painter of Verona, where he was born in 1666. He was brought up as a merchant, but before his 21st year he had commenced to study as a painter under Bellucci at Venice, with whom he remained three years, chiefly engaged in making himself acquainted with the characteristics and methods of practice of the great Venetian masters. He afterwards studied under Carlo Maratta at Rome, and he eventually painted much more in the style of the Roman than of the Venetian painters; he aimed in fact to combine the subdued splendour of Venetian colour with the correctness and solidity of design of the Roman school. Balestra was one of the most able painters of his time, and instructed at Venice a numerous school, in which were educated several very distinguished painters, as Giambattista Mariotti, Giuseppe Nogari, and Pietro Longhi. Among his chief works are the Descent from the Cross, at Venice; an altar-piece in the cathedral of Verona; a Virgin, at Mantua; and a St. Theresa at Bergamo. He died according to the best authorities in 1740. Heineken mentions many prints after the works of Balestra. He engraved also a few plates himself, impressions from which are now very scarce and valuable. (Zanetti, *Della Pittura Veneziana*; Lanzi, *Storia Pittorica*, &c.; Heineken, *Dictionnaire des Artistes*, &c.)

BALFOUR, JAMES, of Pilrig, in Edinburghshire, was admitted an advocate of the Scottish bar on the 14th of November 1730; and was afterwards appointed sheriff substitute of the county of Edinburgh. Having occupied himself much with philosophical science, he early became an opponent of the celebrated David Hume, whose speculations he attacked in two anonymous treatises, the one entitled a 'Delineation of Morality,' the other, 'Philosophical Dissertations;' but his opposition was conducted with so much candour and good feeling, that Hume wrote to him to express his feelings of esteem and request his friendship. In 1754 Balfour resigned his judicial office, having in August of that year been appointed to the chair of moral philosophy, at Edinburgh. This he resigned, in May 1764, for the chair of public law; and soon afterwards he published what appear to have been his lectures while in his former situation, under the title of 'Philosophical Essays.' In the spring of 1779 he resigned the chair of public law, and retired to Pilrig, where he died, 6th of March 1795, at the age of ninety-two, having spent (says the author of the 'Life of Kames,' who must have known him well) a long life in the practice of those virtues which it was the object of his writings to inculcate.

BALFOUR, SIR JAMES, of Pittendreich, Lord President of the Court of Session in Scotland, and the reputed author of Balfour's 'Practicks of the Law,' was son of Sir Michael Balfour, of Pittendreich and Montquhany, county Fife, and in his early years received a liberal education for the church, in the course of which he distinguished himself particularly in the study of the canon and civil laws. The clerical profession in Scotland had long engrossed some of the first offices of the state, and, by the establishment of the Court of Session, had brought to a favourable termination an arduous contest with the lord justiciar for the supreme place of judicature. At the commencement of the Reformation in Scotland, Balfour attached himself with great zeal to the partisans of the reformed doctrines, and even joined the conspiracy led by Norman, eldest son of the Earl of Rothes, against the Cardinal Beaton. Being taken in the castle of St. Andrews when that fortress surrendered to the French auxiliaries in the end of the summer of 1547, he was put into the same gally with Knox, and carried prisoner to France. The cause of Scottish Protestantism seemed now at an end, and the partisans of Rome were filled with exultation, but their rejoicing was premature; the evils inflicted on the reformers proved only as the process of the winnowing floor, which separates the chaff from the wheat. Accordingly, on the peace of 1549, Knox, Balnavis, and others, returned to Scotland with new ardour in the cause of the reformation. Balfour also returned, but now that the old faith was in the ascendancy he professed himself a Roman Catholic, and even denied that he had been of the Protestant party; though, as Knox says, his own conscience and a thousand witnesses could testify the fact. He was immediately appointed official of St. Andrews within the archdeaconry of Lothian, and in this situation, with the zeal of a suspected confederate, he proceeded ex-officio against the poor old priest Walter Mylne for heresy, because he had given up saying mass, and had him condemned to the flames and burnt.

On the breaking out of the civil war between the congregation and the queen-regent in 1559, Balfour took the part of the latter; yet it appears he knew also all the transactions of the former. He escaped the search of the reformers in Fife in February 1560; and was about the same time appointed parson of Flisk in that shire. Soon after the arrival of the young queen in 1561 he was appointed an extraordinary lord of session, and on the 5th of November 1563 advanced to the place of an ordinary lord in the same court. On the institution of the Commissaries' Court of Edinburgh, in the room of the court of the official of Lothian, he was constituted its chief judge; and on the 5th of July 1565 he was sworn of the queen's privy council. To

these various employments of privy councillor, judge, and priest, he seems to have added practice at the bar, for in January 1566 we find him in the court of justiciary as 'assister' of the crown in the criminal prosecution against old Andrew Ballingall of Drumbarro, for wilful absence from the 'raid' of Stirling. (Pitcairn, 'Crim. Trials.') He was with the queen at Holyrood on the night of Rizzio's assassination; and he shortly after had new honours conferred upon him, the queen creating him a knight, and appointing him lord clerk register, in the room of Mr. M'Gill, who was one of the conspirators, and had fled. In the same year Balfour was employed with Lealy, bishop of Ross, in preparing, in obedience to a royal commission, a volume containing, for popular information, the acts of parliament passed from 1424 to 1564.

With the quickness of perception characteristic of a thorough courtier, Balfour attached himself to Bothwell, whose increasing influence in the royal closet he was one of the first to observe. He joined in the conspiracy against the youthful Darnley, who, with something like a presentiment of his fate, now urged the queen to accuse Balfour of being accessory to the murder of Rizzio, and to dismiss him from her councils. Balfour framed the bond for mutual support entered into by the conspirators, and prepared the house in the kirk of Field for the execution of the deed, but was not actually present on the occasion. He was however distinctly charged as an accomplice in the crime, both in the Earl of Lennox's despatch and in a popular placard put up in answer to the government offer of a reward for a discovery of the perpetrators. Bothwell was brought to an early trial, which no entreaty of Lord Lennox, his prosecutor, could stay; but as the evidence was not ready, his guilt was not established, and he was acquitted.

On the 22nd of April 1567, the queen, under the influence of Bothwell, appointed Balfour captain of Edinburgh Castle, in the room of Sir William Cockburn of Skirling, to whom she had given it in charge only on the 8th of March preceding. Both the queen and Bothwell however lived to repent of their confidence, and on their fortunes falling sought to displace Balfour, who now disowned his lieutenantancy, and holding the fortress as "full master thereof," began to treat with the associate lords for its surrender to them. On the defeat of Carberry, Bothwell dispatched a special messenger to the castle for Mary's letters. These Balfour delivered; but, as Bothwell's influence was now entirely gone, he first sent notice to the associate lords, who watched the messenger's return, attacked him, and carried off the famous casket with its contents, to which they ever after appealed in proof of Mary's guilt, and in justification of their conduct towards her. Balfour afterwards gave up the castle to the regent Murray on the following extraordinary conditions:—1st, a pardon for art and part in Darnley's murder; 2nd, a gift of the priory of Pittenweem; 3rd, an annuity to his eldest son out of the priory of St. Andrews; 4th, a large sum (Spottiswoode calls it 5000*l.*) in present hand; and 5th, delivery of the castle into the hands of Kirkcaldy of Grange, an adherent of the queen's. Murray, on attaining the regency, became an open supporter of the Reformation; and in his first parliament we find a commission issued, in which Balfour (now prior of Pittenweem) is named, to ascertain the jurisdiction of the church of Scotland. Among other preferments which Balfour managed to obtain was that of Lord President of the Court of Session, to create a vacancy in which, Bailie of Provand was summarily displaced after two years' occupancy, on the alleged ground of his not being a prelate, agreeably to the institution of the court. In the exciting personal and political questions of that day, no matter what party had, or appeared likely to have, the preponderance for the time, Balfour was pretty sure to have a prominent place in its ranks. Thus, in May 1568, we find him with the regent in the vanguard at the battle of Langside, and in the end of the same year he was agitating in the regent's absence for the restoration of Queen Mary. In the opening of the year 1570 took place the murder of 'the good regent' by Hamilton of Bothwellhaugh, an event which appears to have inspired Mary's adherents with great hopes. Of those Balfour was now one; and on the 30th of August 1571, he and some others of that side were attainted in a parliament held by the king's men. In September 1571 Mary was made regent; but the aspect of affairs soon changed: an alliance was formed between France and the Queen of England, who also at length openly declared for the king's party, and lent her powerful aid to place Morton in the regency. Morton, on his becoming regent, endeavoured to effect a settlement with the queen's party; but all his overtures were rejected by Maitland and Kirkcaldy. Balfour however readily acceded to the triumphant Morton, whom he also endeavoured to conciliate by acts of shameless treachery. He was mainly instrumental in bringing about the concord called the Pacification of Perth, in February 1572, whereby his late coadjutors were again placed at the mercy of the regent; and he revealed to Morton that Kirkcaldy's brother was about to land at Blackness with a supply of money from France. In July 1572 Morton brought his victims to trial for Darnley's murder, and had them sentenced to the scaffold. Balfour however not only escaped a trial, but the following year had his forfeiture annulled and himself restored by act of parliament; and in 1574 the regent committed to him and Skene a design for a general digest of the laws. What progress was made in this matter, and whether Balfour's 'Practicks' was the result, does not certainly appear. Balfour soon after repaired to France, dis-

trusting his safety in Scotland. When the young king assumed the reins of government, Balfour returned to his native country, and joined the party who watched for the destruction of the yet formidable Morton. The same year he was one of the arbiters chosen by the earls of Argyll and Athol in the attempt then made to effect a reconciliation. On the 5th of February 1578, we find him at the bar, as one of the advocates, or 'prolocutors,' for the prosecution in the criminal trial of one Thomas Turnbull for murder. The following year Morton recovered his authority, and Balfour again fled from before him. An act was thereupon passed in parliament, renewing the forfeiture which had been pronounced in 1571, a proceeding against which Balfour afterwards protested on the ground of his restoration in 1573; and his plea, though not immediately, was ultimately successful. The death of Morton, whose enemies daily increased both in number and power, was now to be accomplished; and as Balfour had taken care to preserve the bond by that nobleman and others in support of Bothwell in the murder of Darnley, a plan was speedily devised: Morton was accused of treason, tried, convicted, and beheaded.

This was Balfour's last public act, and it too clearly shows that age had in no degree dulled his capacity for intrigue or his thirst for revenge. He died soon after, in the year 1583. After his death, he was restored, against the forfeiture of 1579, by act of parliament; but acts of parliament can wipe off those taints only which human laws have created: they cannot remove the stains of profligacy, nor wash away infamy from the memory of the corrupt.

(Knox, *Hist. of the Reformation*; Keith, *Hist. of the Reformation*; Goodal, *Preface to Balfour's Practicks*; Tytler, *Life of Craig*; *Historical Account of the Senators of the College of Justice*.)

BALGUY, JOHN, an eminent divine of the Church of England, was born August 12th, 1686, at Sheffield; and was educated in the grammar school of that place, partly under his father and partly under the instruction of a Mr. Daubuz, who had succeeded his father as master there. He became a member of St. John's college, Cambridge, in 1702, and in 1706 was admitted to the degree of B.A.; after which he ceased to reside in the university, and for awhile taught in the grammar school at which he was brought up. For some time he was private tutor to Joseph Banks, Esq., grandfather to Sir Joseph Banks, Bart., President of the Royal Society. Mr. Balguy took orders in 1710; in 1711 he became private tutor in the family of Sir Henry Liddell, of Ravensworth Castle, Durham, who afterwards bestowed upon him the donative of Lamesly and Tanfield in that county; and he married in 1715.

Mr. Balguy's publications were chiefly controversial. Several of the earliest of them were directed against Mr. Stebbing and Bishop Sherlock, and in defence of Bishop Hoadly, in the Bangorian controversy; others were written in reply to deistical works. In 1726 he took the degree of M.A., and in the same year published 'A Letter to a Deist concerning the Beauty and Excellence of Moral Virtue, and the Support and Improvement which it receives from the Christian Revelation.' In 1728 Mr. Balguy was collated by Bishop Hoadly to a prebend in the church of Salisbury. In 1727 or 1728 he preached an assize sermon on the subject of 'Party Spirit,' which was printed by order of the judges; and in the latter year published a tract entitled 'The Foundation of Moral Goodness,' in answer to Mr. Hutcheson's 'Inquiry into the Original of our Ideas of Beauty and Virtue;' of this tract he published a 'Second Part' in 1729. In 1729 he became vicar of Northallerton in Yorkshire, in which preferment he continued to his death. In 1729 he also published 'The Second Part of the Foundation of Moral Goodness,' illustrating and enforcing the principles contained in the former part, which had been answered in some remarks written by Lord Darcy. His next publication was 'Divine Rectitude; or a Brief Inquiry concerning the Moral Perfections of the Deity, particularly in respect to Creation and Providence.' It was followed by 'A Second Letter to a Deist concerning a late Book, entitled "Christianity as old as the Creation," more particularly that Chapter which relates to Dr. Clarke.' To this succeeded 'The Law of Truth, or the Obligations of Reason essential to all Religion; to which are prefixed some Remarks supplemental to a late Tract entitled "Divine Rectitude."'

Mr. Balguy collected his various treatises (except his assize sermon, and the tracts on the Bangorian controversy), and published them in one volume 8vo, London, 1734, with a dedication to Bishop Hoadly. In 1741 appeared his 'Essay on Redemption,' in which he explains the doctrine of atonement in a manner similar to that of Dr. Taylor of Norwich; but Hoadly was of opinion that he had not succeeded. This and his volume of sermons, including six which had been published before, were the last pieces committed by him to the press. A posthumous volume was afterwards printed, which contained almost the whole of the sermons he left behind him. While in possession of the donative of Lamesly and Tanfield, for the first four years he never intermitted one week without composing a sermon; but fearing that his son, who was afterwards in orders also, might not follow his example, he destroyed almost his whole stock, and committed at one time two hundred and fifty sermons to the flames. The third edition of Mr. Balguy's 'Sermons' (twenty in number) was published in 2 vols. 8vo, London, 1790. He died at Harrogate, September 21st, 1748.

(*Life*, communicated by his son to the *Biographia Britannica*.)

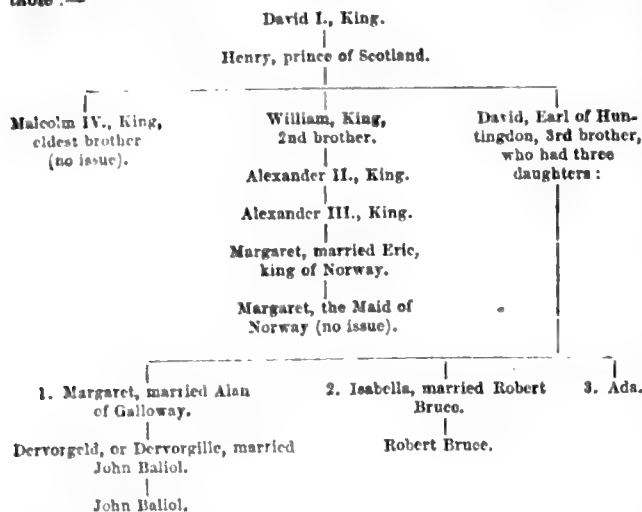

BALGUY, THOMAS, D.D., only son of the Rev. John Balguy, was born at Lamesly, in the bishopric of Durham, September 27th, 1716, and was educated at the free school of Ripon in Yorkshire. In 1734 he was admitted at St. John's College, Cambridge; took the degree of B.A., 1738; M.A., 1741; D.D., 1758. In March 1740 he had been elected Fellow of his college, upon Mr. Platt's foundation, which he vacated in 1748, upon being presented by his father (as prebend of Salisbury) to the living of Stoke, near Grantham in Lincolnshire. He was also for a time joint tutor of St. John's College. By the interest of Bishop Hoadly he obtained a prebend in the cathedral of Winchester in 1757; became archdeacon of Salisbury in 1759; and afterwards archdeacon of Winchester. In 1769 he published a sermon preached at Lambeth at the consecration of Jonathan Shipley, D.D., bishop of Llandaff, which was attacked by Dr. Priestley. In 1771 he was presented by the dean and chapter of Winchester to the vicarage of Alton in Hampshire, upon which he resigned the living of Stoke. In 1772 he published 'A Defence of Subscription to Articles in Religion,' in a charge delivered to the clergy of his archdeaconry. His sermon at the consecration of Bishops Hurd and Moore, also published in 1775, produced some 'Remarks by One of the Petitioning Clergy.' In 1775 he edited the sermons of Dr. Powell, master of Jesus College, Cambridge, with a life of that divine prefixed. In 1781 the declining state of his health, and particularly the decay of his sight, which ended at last in total blindness, prevented his acceptance of the bishopric of Gloucester, to which his Majesty, without any solicitation, had nominated him upon the death of Bishop Warburton. In 1782 he published 'Divine Benevolence asserted and vindicated from the Reflections of Ancient and Modern Sceptics,' 8vo. In 1785 he republished his father's 'Essay on Redemption,' with a preface, seemingly intended to bring his father's sentiments nearer to the orthodox belief. A collection of his sermons and charges appeared the same year, under the title of 'Discourses on Various Subjects,' 8vo. These were again printed in 1822 at Cambridge, with additions, in two volumes, edited by the Rev. James Drake. Dr. Balguy died January 19th, 1795, in his seventy-ninth year, at his prebendal house at Winchester, and was buried in that cathedral. In 1831 a small portion of a course of lectures on the feudal laws and the English constitution, which Dr. Balguy had composed while resident at Cambridge as tutor of his college, was published under the title of—1, 'Connected View of the several Steps by which the Parliament of England obtained its present Form; 2, The Maxim that Power follows Property applied to the History of the English Constitution,' 8vo. (Nichols, *Life of Bayly*; Chalmers, *Biog. Dict.*; *Memoir of Dr. Balguy*, prefixed by Mr. Drake to his edition of the *Discourses*, 8vo, 1822.)

BALIOL, or BALLIOL, JOHN, the successful competitor with Bruce for the crown of Scotland, was descended from an ancient Anglo-Norman family that held large possessions in England, Normandy, and Scotland. He was the only son of John Baliol, lord of Galloway, and was born about the year 1259. In 1290 he first becomes an object of historical notice, as one of the claimants to the then vacant Scottish throne; claiming in right of his grandmother, the eldest co-heiress of the only son of David I., king of Scotland, that had issue living.

The recently-deceased king of Scotland, Alexander III., was married to the daughter of Henry III. (father of Edward I.), then king of England. In 1281 Alexander gave his only daughter Margaret in marriage to Eric, the youthful sovereign of Norway; and, by the 16th article of the treaty of marriage, it was stipulated that the issue should succeed to the throne of Scotland in the event of failure in the male line. This failure shortly after took place by the death in 1284 of Alexander's only surviving son without issue; by which circumstance the only child of Eric and the Scottish princess, a daughter also called Margaret, and known in Scottish history and ancient ballads by the appellation of the 'Maid of Norway,' became heir-presumptive to the throne of Scotland. By the death of Alexander himself in 1286 the Maid of Norway became rightful queen of Scotland. She was at this time but three years old, and a council of regency was appointed to execute the duties of the sovereign.

Edward I. of England, who had long regarded Scotland with the eyes of a feudal superior, availed himself of the opportunity to assert his claim. He was the nearest male relative on the mother's side of the infant princess, who was his grand-niece; and Eric, naturally anxious for the interest of his daughter, solicited in her favour the protection of the king of England. Edward conceived that his long-cherished design of uniting Scotland to the English throne might now be realised by marrying the royal heiress to his eldest son, the Prince of Wales. But the scheme when on the point of being carried out, as far as the age of the children permitted, by the concurrence of the father of the princess, the vote of the Scottish parliament, and the sanction of the pope, was suddenly overthrown by the untimely death of the young queen in 1290, which opened a new scene of strife and calamity to Scotland. By this event the posterity of the three last kings of Scotland became extinct, and the throne became the possession of the next in kin or law. Thirteen candidates presented themselves, each asserting the claims of birth and consanguinity; but the pretensions of the majority were so utterly groundless, that the contest was soon reduced to two competitors—John Baliol, lord of Galloway, and Robert Bruce, lord of Annandale. The claims, relative

and direct, of these two noblemen will be seen in the following table:—

This table shows that Baliol was the grandson of the eldest daughter; Bruce the son of the second daughter: the point at issue therefore was, whether the crown belonged of right to the representative of the eldest daughter, though more remote by one degree, or to the representative of the second, who was nearer by one degree—that is, in fact, whether the crown descended in the order of birth, according to the modern system of primogeniture, or was hereditary in the order of proximity of blood. At the present day the question would not admit of any dispute; but in the 13th century the principles of succession had not been definitely settled, and the claims appeared to be so equally balanced that a decision in favour of Bruce would by no means warrant the imputation of deliberate injustice. The estates of Scotland were either afraid or unwilling to decide between the competitors, and, alarmed at the prospect of civil war, they determined to refer the decision of the controversy to the king of England. This reference was extremely acceptable to Edward, as it gave him a position in which his own views might be worked out, with strict regard to the formalities if not the spirit of judicial procedure. Though there can be no doubt that he employed his alleged feudal superiority as a means towards subjugating Scotland, he laboured to invest the proceedings with the garb of judicial deliberation and free agency. The declaration which he compelled the estates of Scotland to subscribe of their acts (by which his claim as lord paramount of his vassal kingdom of Scotland was acknowledged without qualification) being wholly uninfluenced by fear or force—a declaration which bears the stamp of falsehood on the face of it—is a striking instance of his respect for the external observance of justice.

After a tedious inquiry of nearly two years' duration, the delegates to whom the English king referred the consideration, as a point of the law of inheritance, of the claims of the several competitors to the vacant throne, made their report unanimously in favour of the heir of the eldest daughter—that is, in favour of primogeniture; and accordingly Edward gave judgment, not as arbiter, but as feudal superior, that John Baliol, as the heir of the eldest daughter, should receive and have seisin of the kingdom of Scotland and all its appurtenances. This occurred on the 19th of November 1292. Next day Baliol swore fealty to the king of England as his feudal superior and sovereign lord of the realm of Scotland. The new king was crowned at Soons on the 30th of November, and again went through the ceremony of vassalage within less than a month after at Newcastle. It is but right to add that the estates of Scotland and the other competitors, with Bruce (the namesake and grandfather of the hero of Bannockburn) at their head, had, in the first stage of the inquiry, fully acknowledged Edward's claim as lord paramount; so that Baliol's oath of fealty after the decision in his favour was only in keeping with the whole proceedings. The claim of the king of England's feudal superiority over Scotland was of long standing, frequently acknowledged, and, though constantly evaded, very seldom openly denied.

Baliol soon found that he had fallen into the hands of a master who was determined to let his power be felt and his feudal superiority be recognised by the Scottish people as well as his king. Suitors in the courts of Baliol, who were dissatisfied with his judgment, were encouraged to appeal to the lord paramount, and found in Edward a willing hearer. Even before Baliol had occupied the throne a single year, he was served with no less than four citations to prove the legality of his decisions in the courts of the lord paramount. Baliol was timid and weak, but not mean in spirit. Being summoned to answer the complaint of the Earl of Fife before the king of England, he attended, but maintained that he was not bound to answer the appellant; that it was a matter which regarded the rights of the crown; and that he dared not answer without the advice of the good men of his realm.

He was reminded of his oath of fealty, but told that he might have time to consult his council. He replied that he would not ask for either time or adjournment. Judgment for contempt and disobedience to the authority of his feudal superior was formally given against him by the English court, which he however continued to ward off by requesting permission to consult his subjects. War ensued, and he lost his kingdom before the judgment was acted upon.

In 1295 war broke out between France and England. The estates of Scotland eagerly caught at so favourable an opportunity of asserting the independence of their country, and prevailed upon Baliol to conclude an alliance offensive and defensive with the French monarch. The management of this was intrusted to a committee of nobles, the nation having no confidence either in Baliol's patriotism or wisdom. Edward made extensive preparations for chastising his rebellious vassals. He first cited Baliol to appear before him at Newcastle. The summons was unattended to, the Scottish barons detaining their king in a kind of honourable captivity in the highlands. This was in March. On the 5th of April Baliol sent to the English monarch a formal renunciation of homage in his own name and that of his barons. Edward answered this by invading Scotland, when the Scotch were everywhere defeated; and Baliol after being compelled to perform the most humiliating acts of feudal penance, had to sign an instrument, in which he acknowledged the right of Edward to enter into possession of his fee after the renunciation of homage, and transferred to him the fealty which the Scottish barons and freeholders had sworn to himself. This formal surrender of his kingdom of Scotland took place on the 2nd of July 1296, just four years after his accession.

Edward's treatment of the deposed monarch was indulgent, and showed that he regarded him as a mere puppet of royalty in the hands of the lords of his council, who originated and conducted the war. From Kincardine, where he signed the act of abdication, he was transferred, with his son Edward Baliol, to the Tower of London, where he resided for three years, with some state, and the liberty of a circle of twenty miles. In accordance with his own wish he was in 1299 allowed to retire to his patrimonial estates in Normandy, on his solemnly pledging himself never more to intermeddle in the affairs of Scotland, and the pope becoming surety for the performance of his promise. His death took place in 1314, just after the battle of Bannockburn.

Baliol is usually held up to scorn by Scottish historians as a mean-spirited prince, who purchased the empty honours of a throne at the expense of his country and independence. But it required much more firmness and ability than he possessed, and a much more favourable combination of circumstances than attended his elevation, to defeat the ambitious designs of his powerful neighbour, and wield the sceptre of Scotland in the unsettled times in which he lived. The contemptuous epithet 'Toom Tabard,' 'Empty Jacket,' bears significant testimony to the estimation in which he was held by his countrymen.

(Hemingford, *Hist.*; Rymer, *Fœdera*; Lord Hailes, *Annals*; Tytler, *History of Scotland*; Lingard, *History of England*.)

BALIOL, or BALLIOL, EDWARD, shared his father's captivity in the Tower, and accompanied him to his paternal residence in Normandy. With the exception of his visits to the English court in 1324 (when he was invited over by Edward III. with a view to intimidate Robert Bruce), and in 1327, it would appear that he led a life of retirement in Normandy till the year 1332, when we find him taking an active part in the enterprise of the lords Wake, Beaumont, and other 'querellours' (as the disinherited lords were called), to take forcible possession of their forfeited estates in Scotland. Many of the Anglo-Norman barons possessed estates both in Scotland and England, and during the war between the Bruce and the English kings, which ended in favour of Bruce, their estates were seized by both the belligerents. An express clause however in the treaty of Northampton in 1327, restored the forfeited Scottish estates of the English lords Percy, Wake, and Beaumont; and under the sanction of this clause, the last two noblemen, after having in vain claimed its fulfilment from the regent and parliament of Scotland, determined to assert their rights by force of arms. Edward Baliol having been induced to join the enterprise, these bold confederates proceeded with a body of 300 horse and a few foot soldiers to invade a kingdom which was then in the full flush of success and newly-achieved independence. Small as the invading force was, their progress was marvellous. They entered the Frith of Forth, landed at Kinghorn in Fifeshire, defeated the Earl of Fife, and, with an increased force not exceeding altogether 3000 men, marched boldly across the country to meet an enemy at least ten times more numerous than themselves. The army of Baliol encamped near Forteviot, with the river Earn in its front. On the opposite bank the Earl of Mar lay encamped with a force of from 30,000 to 40,000 men; while a second army, commanded by the Earl of March, lay within eight miles of Baliol's flank. Baliol relieved himself from this perilous position by an act of extraordinary daring. In the dead of night he crossed the Earn at a point where it was fordable, and attacked unawares the sleeping and defenceless Scots. The carnage was dreadful: 13,000 Scots, including the earls of Mar and Moray, and many knights and barons, lay dead on Duffin Moor, the scene of battle; while the loss of the English was extremely small. From Duffin Moor Baliol and his confederate barons hastened

to Perth, where he was unsuccessfully besieged by the Earl of March, whose followers soon after dispersed. The ancient adherents of Baliol's family, and all persons disaffected to Bruce, now crowded to Baliol's standard, and he was crowned King of Scotland at Scone, on the 24th of September, only seven weeks from the day of his landing at Kinghorn. Baliol did not hold the crown long at this period. Having privately renewed to Edward III. all the forms of feudal subjugation imposed on his father by the first Edward, and concluded an armistice for the purpose of settling the kingdom by a convention of the states, he lay carelessly encamped at Annan, where he was surprised by a body of horse commanded by the young Earl of Moray, brother to the earl who fell at Dufflin. Baliol with difficulty escaped half naked to the English Marches, once more an exile and a fugitive. This event occurred on the 16th of December, within less than three months from the date of his coronation.

Edward III. promptly interfered in favour of his vassal; and the battle of Halidon Hill, July 10, 1333, again placed Edward Baliol on the throne of Scotland. The loss of the Scots in this action was very great, and probably Baliol's seat would have been firm had he not outraged the national feelings by the extent of his concessions to his royal benefactor. Besides renewing his feudal homage in the fullest terms, he by a solemn instrument made an absolute surrender of the fertile provinces of Berwickshire, Roxburghshire, Selkirkshire, Peeblesshire, Dumfriesshire, together with the Lothians. Disgusted with Baliol's subserviency to the English monarch, the nation centred its hopes on David, the infant son of Robert Bruce. So long as Baliol was supported by the king of England he exercised a nominal sovereignty, but the moment the pressure of that monarch's iron hand was withdrawn, the deep-rooted hatred of the Scots against their vassal king broke out into fresh acts of resistance. Baliol himself placed so little reliance on his subjects, that he fled to England at every reverse of fortune. Baliol continued for some years to struggle against the obstinacy of his opponents, and the lukewarmness and perfidy of his adherents. In 1334 he was compelled to fly, in consequence of a quarrel between the most powerful of his confederate barons. He was soon after restored by the arms of his feudal master. Next year Edward III. again marched an army into Scotland, for the double purpose of sustaining his vassal and securing the territories which had been ceded to him. But happily for Scotland, the power and ambition of this warlike and able monarch were soon after allured by a more splendid prize, the conquest of France, which mainly engrossed his attention and resources for several years; during which fortress after fortress fell from the hands of Baliol, and the cause of King David, the heir of Bruce, daily acquired strength.

In 1355 Edward III. determined to put an end to the interruptions which the Scottish wars had constantly offered to his operations in France. He marched an immense army, composed, in great part, of the victorious veterans in the French wars, with a view of effecting a final conquest of the kingdom, and annexing it, as Edward I. had annexed Wales, to the larger and richer portion of the island. As a preliminary step he purchased Baliol's rights to the Scottish throne, rights which Baliol, now, a king merely in name, advanced in years, and without children or near of kin to inherit, gladly exchanged for the retirement and calm suitable to the evening of life. For the surrender of a barren and disputed title he received a present of 5000 marks, and an annuity of 2000*l.* sterling. His name does not again appear in history. He retired into a peaceful though inglorious obscurity; and died childless at Doncaster, in the year 1363. With him ended the line of Baliol.

BALNAVIS, HENRY, of Halhill, an individual who, by his talents and probity, raised himself from obscurity to a situation of the first importance in the state of Scotland. He was born in 1520, of poor parents, at Kirkaldy, in the county of Fife, and after some instruction at one of the schools at St. Andrew's, he proceeded abroad. At Cologne he got admission into a free school, where he received a liberal education, together with instruction in the principles of the Protestant faith. He returned to his native place towards the latter end of the reign of King James V., and having applied himself to the study of the Roman jurisprudence, for some time acted as a procurator in the courts of the then metropolitan city of St. Andrew's. About the same time he married Christian Scheves; and on the 10th August, 1539, he had a charter to himself and his spouse of the lands of Halhill, in the county of Fife, from which he thereafter took his designation. From St. Andrew's he removed to Edinburgh, where he was one of the earliest friends of the Reformation; and notwithstanding the jealousy of the papal clergy, his reputation introduced him to the court. On the 31st of July 1538, he was appointed a Lord of Session. He sat in the parliament of 4th November 1538, by special commission; and in the subsequent parliaments his name often occurs. In January 1541, he was joined in a commission to adjust one of the frequently-recurring disputes about the Borders.

On Mary's accession to the Scottish throne, in 1543, the Earl of Arran was made regent of the realm, and Balnavis, who is said to have powerfully contributed to Arran's appointment, was promoted to the situation of secretary of state. Balnavis and his party found however that the timid and yielding Arran was not one to be depended upon for efficient support. Balnavis was instrumental to the passing of the important act, introduced into the parliament by the Lord Max-

well, and passed, notwithstanding the opposition of the lord chancellor and all the prelates, for allowing the Holy Scriptures, "baith the New Testament and the Auld," to be translated and read by the people in the vulgar tongue. In May of the same year he was one of the commissioners dispatched by the parliament to the English court to treat of a peace with England, and of a marriage between Prince Edward and the young Queen of Scotland, both of which were quickly agreed to, except as to the time of Mary's passage into England, on which point new instructions were given and additional commissioners appointed. These treaties were hailed as tokens of peace by the friends of the Protestant faith, but they were with equal earnestness deprecated by Cardinal Beaton and his coadjutors. When the cardinal succeeded to the chancellorate, he used all his influence to get the treaties annulled by the parliament. Balnavis also was dismissed from his office by Arran, at the instigation of the regent's base brother, John, abbot of Paisley, a bigoted Catholic, just returned from France, and on whom the cardinal, sure of his influence over the timorous regent, immediately conferred the privy seal, and soon afterwards the post of lord treasurer. The same year Balnavis, the Earl of Rothes, and the Lord Gray were seized at Dundee, and conveyed to the castle at Blackness, on the Forth, where they in all probability lay immured till the arrival of the English fleet in the river, in the month of May following, set them at liberty. It has been asserted that Balnavis entered into the conspiracy at the court of King Henry for the murder of Beaton; but of this there is no evidence, though unquestionably he took refuge in the castle of St. Andrew's, like Knox and several others who were not engaged in the conspiracy; and in all likelihood he participated also in the reformer's sentiments on the fall of 'the bludie boucher.' (Knox, 'Hist.' 4.)

On the accession of Edward to the English throne, in January 1547, the conferences for a peace and marriage were renewed; and on the 9th of March following, Balnavis and others bound themselves to endeavour to the utmost of their power to bring about the union, and also, for the more effectually securing that object, to keep possession of the castle of St. Andrew's: Edward, on the other hand, gave them pecuniary assistance and a military force to defend the place. On the 15th of the same month also Balnavis and his friends bound themselves to Edward to endeavour to get Mary into England to be educated and brought up there until her marriage, and on the latter event taking place, to deliver up the castle of St. Andrew's to the English monarch. These proceedings have been condemned as treasonable by writers who dislike Balnavis, and defended by his admirers as having been undoubtedly taken in good faith, and not for private or personal aggrandisement, but for the public weal. Such a plea is however manifestly a dangerous one, and Balnavis must be content with such justification as the general practice of persons in similar circumstances can afford. In August however a fleet and land-forces from the king of France appeared before St. Andrew's in support of the regent and the papal faction, and those within the castle were, after a vigorous defence, at length obliged to surrender. They were conveyed to France, and, in violation of the articles of capitulation, sent to the castle of Rouen, in Normandy, as prisoners of war. Here, as we are expressly assured by Knox, who was one of the captives, solicitations, threats, and even violence, were employed to make them recant their Protestant opinions, but to no purpose. While in prison Balnavis employed himself in writing a treatise on justification, and the works and conversation of a justified man. Knox was so pleased with the performance that he divided it into chapters, added some marginal notes and an epitome of its contents, and to the whole prefixed a recommendatory preface. The manuscript was discovered after Knox's death by his servant, Richard Bannatyne, at the house of Cockburn of Ormiston, and printed under the title of 'Confession of Faith, containing how the troubled man should seek refuge at his God: compiled by M. Henry Balnavis, of Halhill, one of the Lords of Council and Session of Scotland, being a prisoner within the walls of the old palleace of Roan (Rouen) in the year 1548.' T. Vautrollier, Edin., 1584.

In 1554 Arran resigned the regency, to which the Queen Dowager, Mary of Guise, was then raised; and she, to soothe her Protestant supporters, recalled the laird of Grange and the other conspirators from their banishment; and the forfeiture which had been pronounced against Balnavis was also rescinded. In the proceedings of the people of Scotland which soon afterwards followed, Balnavis took a leading part for the reformers; and on more than one occasion he was employed in confidential business by the Lords of the Congregation. For awhile however the tide of prosperity again flowed in their favour, and in the parliament of 1560 the reformed religion was established by law.

On the 11th of February 1563, Balnavis was reappointed a lord of session, in the room of Sir John Campbell, of Lundy, deceased; and on the 29th of December in the same year he was named by the General Assembly of the Church of Scotland one of the commissioners appointed by that venerable body to revise the 'Book of Discipline.' He attended the regent Murray as one of the commissioners from Scotland to York in relation to the charges against Mary for the murder of Darnley; and he was one of the two afterwards sent to London on the part of the regent in the same matter. According to one account, Balnavis died in 1570; Mackenzie ('Lives,' vol. iii. p. 147) says that he died in 1579. Besides the treatise above mentioned,

Balnavis wrote a short poetical piece, entitled 'Advice to a Headstrong Youth,' which the Scottish poet, Allan Ramsay, has transcribed into his 'Evergreen.'

(Rymer, *Fœdera*, vol. xiv. pp. 781, 783, 786, 792; vol. xv. pp. 142, 144; Sadler, *State Papers*, vol. i. pp. 83, 430; Balf., *Ann.*, vol. i. p. 305; *Hist. of King James VI.*, p. 35; Knox, *Hist.*, pp. 35, 41; Keith, *Hist.*, p. 529; M'Crie, *Life of Knox*, p. 39, note; *Catalogue of Senators of the Coll. of Just.*, p. 60, seq.)

BALTIMORE, LORD, founder of the colony of Maryland in North America. The family name of the Lords Baltimore was Calvert, who were originally of Flemish extraction, but for a long time were settled in Yorkshire. George Calvert, the first Lord Baltimore, held several lucrative situations, and obtained extensive grants of land in Ireland and Newfoundland under James I.; but having, in the year 1624, become a Roman Catholic, he was compelled to give up his office of secretary of state, and to abstain altogether from interfering in public affairs, the intolerant spirit of that age prohibiting the open exercise of the Catholic worship. This circumstance, and the passion for colonisation which then prevailed in England, led Lord Baltimore to turn his thoughts towards America. The French having taken possession of a settlement in Newfoundland upon which Lord Baltimore had expended a very large sum of money, Charles I. made him a grant of all that tract of country which constitutes the present state of Maryland; but he died before the grant was legalised, and the patent or charter was accordingly made out in the name of his son Cecil, the second Lord Baltimore. This charter, which is dated June 20th, 1632, invests Lord Baltimore and his heirs with full powers over the new colony, "to be holders of us and our heirs and successors as of our castle of Windsor, and in fee and common socage, by fealty only, for all services, and not in *capite*, or by knight's service; yielding and paying therefor to us two Indian arrows of those parts every year, on Easter Tuesday, and also the fifth part of all gold and silver mines which shall hereafter be discovered."

Under this charter about 200 persons, of respectable family, and mostly of the Roman Catholic persuasion, entered the Chesapeake Bay in February 1634. Having purchased a village from the native Indians, they proceeded to organise the new colony, called Maryland, in honour of Henrietta Maria, the wife of Charles I. Liberty of conscience was established, as respected the various Christian sects; a representative form of government was established; and the settlement made rapid progress. But the inhabitants of Virginia viewed with a jealous eye the advances which the 'papist idolaters' of the neighbouring state were making in population, wealth, and prosperity; and as Maryland originally formed part of Virginia (taking that term in its extensive sense), they were with difficulty restrained from treating Lord Baltimore as a usurper of their rights and privileges. When the civil war had extended itself to the colonies, the triumph of the anti-Catholics was soon felt in the harsh measures which were directed against the Catholics by the legislature of Maryland. At the restoration however the more liberal policy by which the affairs of that settlement had been regulated prior to the Commonwealth was again adopted; and Lord Baltimore lived long enough to see his most sanguine expectations with regard to its welfare realised. He died in 1676, at an advanced age. Though proprietor of Maryland, Lord Baltimore never resided in it, nor, it is believed, ever even visited it.

BALZAC, HONORÉ DE, a French novelist, was born at Tours on May 20, 1799, the son of a clerk under the government of Louis XV. At the college of Vendôme, where young Balzac was sent early, he gained the character of an idle and disobedient student, and was removed to a private academy. On leaving school he was placed with a notary in Paris, but he almost immediately commenced writing articles for the journals. These are said to be rather testimonies of his perseverance than monuments of his genius. Between 1821 and 1827 he had published a number of tales, none of them exciting or deserving much attention, under the assumed name of Horace de St-Aubin. In 1826, in connection with one Barbier, he commenced business as a printer and bookseller, and among other things published an edition of Fontaine's works, with a notice of Fontaine, written by himself, and commenced the '*Annales Romantiques*.' His speculation was altogether unsuccessful. In 1829 he appeared before the public for the first time, under his own name, with the novel of 'The Last Chouan;' the scene of which was laid in La Vendée, which district he had visited.

It was not however till the publication of his '*Peau de Chagrin*,' in 1829, also under his own name, that the Parisians became alive to the piquant originality and lively fancy that distinguished his works. From that period he was a general favourite in France, and many of his productions have been translated into most of the languages of Europe. He was indefatigable in supplying the public craving under the title of '*Comédie Humaine*.' He planned a series of compositions that was to embrace every phase of human society; and at this he worked for twenty years. Among the most popular were '*La Femme de Trente Ans*,' and '*Le Père Goriot*.'

On the publication of the '*Médecin de Campagne*,' in 1835, Balzac received a complimentary letter from the Countess Eveline de Hanaka, the wife of a Polish nobleman, possessing large estates in Russian Poland. Balzac replied, and an intimate correspondence ensued. To

this lady his novel of '*Seraphita*' was dedicated. The countess became a widow, and a few months after the revolution of February 1848 Balzac quitted Paris to bring her back as his wife. He inhabited a large house near the Champs-Élysées, which he adorned with a multitude of chefs-d'œuvre of art, and in which he hoped to find happiness and peace. But even before his journey he had been attacked by a disorder which it was found impossible to cure or to postpone—disease of the heart—of which he died August 20, 1850. He was buried in the cemetery of Père-la-Chaise, an immense crowd attending the funeral; and Victor Hugo pronounced a critical eulogium over his grave. In that eulogium he says Balzac "chastised vice, dissected passion, fathomed and sounded man in his soul, his heart, his feelings, his brain—the abyss of each in its very essence." There is more asserted here than an English reader can concur in. Balzac had a rich fancy, but not a pure taste; he was an acute observer, but wanted poetic elevation; he was often extravagant, and sometimes wearisome. His '*Contes Drolastiques*—thirty short tales—are written in an antiquated form, a sort of resemblance to the '*Heptameron Français*' of Margaret of Navarre. The '*Contes Philosophiques et Romantiques*' are much inferior to the tales of Marmontel or of Voltaire, of which they are in some degree imitations. His dramas, of which he wrote a few, were failures.

(*Nouvelle Biographie Universelle*.)

BALZAC, JEAN LOUIS GUEZ, Seigneur of Balzac, was born at Angoulême in 1594. His father, Guillaume Guez, was attached to the service of the Duke d'Epéron; and young Balzac went early to Rome as secretary to Cardinal La Valette. His residence of some years in Italy led him to compare the high polish which the language of that country had attained, and the rich literature which it had produced, with the rude and barren condition of the language and literature of his native land. On his return to France he fixed himself at Paris, and then began writing. With the assistance of a cultivated taste, an extensive reading of the Latin classics, and a good ear, he contrived to introduce a harmony and precision of style which were before unknown in French prose, and which acquired him the name of the most eloquent writer of his time, and the reformer of the French language. His contemporary, Malherbe, effected a similar improvement in French poetry. They were both the forerunners of the great writers of the age of Louis XIV.; but Balzac himself, to a reader of the present day, appears almost insufferably affected, finical, and constrained. Balzac's merit made him known to the Cardinal de Richelieu, who obtained him a pension of 2000 francs, with the honorary rank of councillor of state. His works, in his own time, had many admirers, and also many detractors; the most violent among the last was Father Goula, a monk, who attacked Balzac with bitter invective. Balzac replied with great temper in several pamphlets, bearing the fictitious name of Ogier; but at last, disgusted with these polemics, he quitted Paris, and went to live at his estate on the banks of the Charente, near Angoulême. He there continued to write, and to keep up a correspondence with his friends. He died in 1655, and was buried, according to his own directions, in the cemetery of the Hospital of Angoulême, to which institution he left a legacy of 12,000 francs. He also left a gift of 2000 francs to the French Academy for the purpose of establishing a prize for eloquence in prose writing. In course of time most of Balzac's works fell into neglect, except his '*Familiar Letters*,' which have been repeatedly printed. There are some of his other works which scarcely deserve to be buried in obscurity. One of these is his '*Aristippe, ou de la Cour*,' which he dedicated to Christina, queen of Sweden; it is a series of discourses on the duties of princes, ministers, and men in office; on good and on false politics, and on moral principles, with references to ancient and modern history, interspersed with some curious anecdotes. He also wrote '*Le Prince*,' a sort of commentary on the politics and events of his time, and a eulogy of Louis XIII., who is represented as the model of a good king. The other work of Balzac which deserves mention is '*Le Socrate Chrétien*,' a series of discourses on the Christian religion and morality, in which the author reprobates fanaticism, hypocrisy, and persecution, as well as a too prying inquisitiveness into the mysteries of faith.

A selection of the most important thoughts contained in the '*Aristippe*,' the '*Prince*,' and the '*Socrate Chrétien*,' were made by M. Mersan, and published under the title of '*Pensées de Balzac*,' 1 vol. 8vo, Paris, 1808. Balzac wrote also '*Le Barbon*,' an amusing satire on pedants, which he dedicated to Ménage. He wrote Latin verses, epistles, elegies, &c., which were published in one volume by Ménage after Balzac's death. An edition of Balzac's works, in two volumes folio, was published by l'Abbé Cassagne.

(Bayle; Moréri; *Biographie Universelle*; Malitourne, *Notice sur la Vie de Balzac*, prefixed to his edition of Balzac's *Œuvres Choisies*.)

BAMBOCCIO, better known by his proper name, PETER DE LAER, was born at Laeren, in Holland, in 1613. His disposition for art manifested itself in early childhood, and was encouraged by his parents, who procured for him the requisite instruction in the elements of design, and afterwards sent him to Rome. De Laer neglected classical art, which was ill-suited to his temperament, but found a surer inspiration in the freshness, novelty, and animation which the scenes of everyday life presented to his pencil, and which he has exhibited with wonderful truth and vivacity. It is not to be inferred however that

De Laer drew no advantages from his residence at Rome. He was intimately acquainted with N. Poussin and Claude, and frequently made excursions to the environs of Rome in company with those great artists; and there he found those beautiful studies of ruins, tombs, temples, and aqueducts, with which he has so finely embellished his backgrounds. But it was amidst the realities of active life that his genius found its proper subjects. He delighted in fairs, hunting parties, the exploits of banditti, rustic festivals, harvest-homes, and drolleries of all sorts, subjects which the Italians comprise under the general name of 'Bambocciate,' and from which the name given him in Italy was derived, not, as some have asserted, from the deformity of his person. De Laer was profoundly skilled in the art of graduating his objects, whether through the medium of lines or colours. His effects of aerial perspective are surprisingly just, and his skies are touched with a depth, delicacy, and transparency which has rarely been excelled. In the productions of De Laer, although they are generally on a small scale, the figures are marked with all the precision, energy, and distinctness which might be expected in the largest performances. His memory was remarkably retentive, and anything which he had once marked as a fit subject for his pencil he could paint, at any distance of time, with as much facility as if it was still before him.

De Laer's moral qualities gained for him no less respect than his genius. His person was extremely deformed, but this misfortune did not affect in the slightest degree the natural kindness of his feelings, or the cheerfulness of his temper. His amiable character was well appreciated, and co-operated with his talents in procuring him the patronage and friendship of the most eminent persons in Rome. He protracted his residence in that city to sixteen years, and at length, at the earnest entreaty of his friends in Holland, left it with regret for his native country. He occasionally visited Amsterdam, but his principal residence was at Haarlem. His later years were embittered by ill health and depressed circumstances, which caused him frequent fits of despondency, in one of which he is stated to have thrown himself into a canal and been drowned. His death is said to have taken place in 1673, or according to other accounts, in 1675.

De Laer made several admirable etchings from his own designs, which usually bear his signature. The following may be enumerated: a set of eight plates of animals and rural subjects, inscribed 'P. de Laer, Roma, 1636'; a set of six horses, same inscription; a blacksmith shoeing a mule, 'P. v. Laer, f.'; a blacksmith's shop, 'P. D. Laer, f., Roma.'

* BANCROFT, GEORGE, an American historian, was born in 1800, near Worcester, Massachusetts, where his father, Dr. Aaron Bancroft, was a leading Unitarian minister. George Bancroft was entered at Harvard College at the age of 13, and at the age of 17 graduated there with first-class honours, and gained the theological prize—his education having been conducted with a view to his adopting his father's profession. From Harvard he went to Göttingen, where for two years he studied history and philology under Professor Heeren; and he there received the degree of Doctor of Philosophy. During his residence in Germany Mr. Bancroft formed the acquaintance of Savigny, Schlosser, Schlegelmacher, Varnhagen von Ense, Wolfe, and other eminent scholars, from some of whom he derived valuable aid in his historical studies. After travelling through Italy, France, and England, he returned to America in 1822.

For about a year after his return Mr. Bancroft officiated as Greek tutor at Harvard College, and occasionally preached; but when he resigned his tutorship he finally abandoned the ministry. He now established a school at Round Hill, Northampton, Massachusetts, which soon attained considerable celebrity, but which was not pecuniarily successful. Whilst here Mr. Bancroft devoted much attention to his historical studies. He had not long after his return from Europe made his first venture in authorship by the publication of a volume of poems, and he now published translations of several of Heeren's works, and commenced the composition of his 'History of America.' The first volume of this work appeared in 1834, under the title of 'A History of the Colonisation of the United States;' and successive volumes, carrying the history forward to the War of Independence, have appeared at rather wide intervals down to the present time.

The first volume of the 'History' at once established Mr. Bancroft's position among the foremost literary men of America. But he was not destined to lead a merely literary life. He had already entered the political arena by being elected a representative in the General Court of Massachusetts, and, after some oscillation, had taken his stand as a 'pure democrat.' On the accession of his party to office in 1837, Mr. Bancroft was appointed by President Van Buren collector of Boston. On the election of a new president, Mr. Bancroft of course lost his collectorship. In 1844 he was an unsuccessful candidate for the governorship of Massachusetts; but about the same time, or somewhat earlier, he was appointed by President Polk secretary of the navy. In this office he is said to have displayed great administrative ability, and the Astronomical Observatory of Washington, and the Nautical School at Alexandria, are standing monuments of his tenure of office. In 1846 he was appointed minister plenipotentiary to England. Here his chief political service was the negotiation of a modification of the acts regulating navigation. During the three years of his stay here, he diligently explored the public libraries of London and Paris, as well as the state archives, for materials for his

great work; and to its completion he has since his return to the United States mainly directed his attention.

The 'History of America,' is a work of great research, and, while the author states his own opinions decidedly and strongly, it is pervaded by a fair and just spirit. The style is vigorous, clear, and frank—not often rising into eloquence, but frequently picturesque, and always free from imitation and from pedantry. It is in fact what it professes to be—a national work, and it is worthy of its great theme. Besides the 'History,' Mr. Bancroft has published several orations of the usual order of American 'celebration' oratory, and has contributed articles to various reviews and periodicals.

(Griswold, *Prose Writers of America; Homes of American Authors, &c.*)

BANCROFT, RICHARD, Archbishop of Canterbury in the reign of James I., was born at Farnworth, in Lancashire, in September 1544. He was first a student of Christ's College, Cambridge, where, in 1567, he took the degree of B.A., and thence removed to Jesus College, where he commenced M.A. in 1570. In 1575 he was presented to the rectory of Teversham, in Cambridgeshire, by Cox, bishop of Ely; and instituted, in 1584, at the presentation of the executors of Henry Earl of Southampton, to the rectory of St. Andrew's, Holborn. In 1585 he was made treasurer of St. Paul's Cathedral, prebendary of Brounsbury in St. Paul's in 1589, of Westminster in 1592, and of Canterbury in 1594, about which time he distinguished himself by a sermon preached at St. Paul's Cross against the ambition of the Puritans. On May 8, 1597, he was consecrated Bishop of London. From this time he had in effect the archiepiscopal power; for Whitgift being then advanced in years, and unfit for business, committed the sole management of ecclesiastical affairs to Bishop Bancroft. In 1600 Queen Elizabeth associated him with Dr. Parkins and Dr. Swale, in an embassy to Embden, to put an end to the differences between the English and Danes; but the embassy had no effect. In the beginning of King James's reign Bancroft took part in the conference at Hampton Court between the bishops and the Presbyterian ministers, and carried himself in so imperious a manner that even James thought it necessary to check him. According to Fuller however it was observed, that "Bancroft, when out of passion, spake most politicly." In 1604, upon Whitgift's death, he was promoted to the archbishopric of Canterbury; and in 1603 was elected Chancellor of the University of Oxford, in the room of the Earl of Dorset. He died November 2, 1610, of the stone, in his palace at Lambeth.

Bancroft filled the see of Canterbury with great reputation: he was a learned controversialist, an excellent preacher, an acute statesman, and a vigilant governor of the Church. He was however rigid in his treatment of the Puritans, and on that account has been spoken of with some severity. He was the chief overseer of the authorised translation of the Bible. By his will he bequeathed his body to be buried in Lambeth Chapel; and all the books in his study to the archbishops for ever. His remains were however interred in Lambeth Church. His published works were as follows:—'Discovery of the untruths and slanders against Reformation,' in a sermon preached February 1588; 'Sermon on 1st John iv. 1,' London, 1588; 'Survey of the pretended Holy Discipline,' London, 1593; 'Dangerous Positions and Proceedings published under the pretence of Reformation, for the Presbyterian Discipline,' London, 1595.

(*Biographia Britannica*, edit. 1778, vol. i. p. 577; Wood, *Fasti Oxon.*; Bishop Kennett, *MS. Collections*, MS. Lansd. Brit. Mus. 983, fol. 155, 157; Chalmers, *Biog. Dict.*)

BANDELLO, MATTEO, was born at Castelnovo di Scivina, in the province of Tortona, in North Italy, in the latter part of the 15th century. He entered the order of St. Dominic, of which his uncle was a member. The young Bandello was an inmate of the Convent delle Grazie at Milan at the time that Leonardo da Vinci was painting his famous Last Supper in the refectory of that house, and he there heard Leonardo relate a story which afterwards furnished him with the subject of one of his novels. In 1501 his uncle, being elected general of the whole Dominican order, took Bandello with him in the travels which he was obliged to undertake in the discharge of his new duties. They visited Florence, Naples, and other parts of Italy. Having returned to his convent at Milan, Bandello was obliged to run away when the Spaniards entered that city in 1525, his father having taken part with the French. His apartments were plundered, and he lost all his books and papers; but he found an asylum with Cesare Fregoso, an Italian officer in the French service, whom he accompanied to several courts of Italy, and afterwards to France, where he obtained, in 1550, from Henry II., the bishopric of Agen. Bandello left the care of his flock to the Bishop of Grasse, reserving to himself part of the income of his see. He died in the year 1561. Bandello's 'Novelle' or tales are written somewhat after the manner of those of Boccaccio, though in less pure Italian. In fluency of narrative, and vividness of description, Bandello rivals and even at times surpasses the Tuscan novelist. On the score of morality, most of his tales are as exceptionable as those of Boccaccio. One of his pathetic tales is on the subject of Romeo and Juliet, which however had been already treated by Luigi da Porto, a contemporary writer, from whom it would seem Bandello took it. The first edition of Bandello's novels is that of Lucca, 1554, in 3 vols. 8vo. A fine edition of Bandello's novels was published in London, 1740, 3 vols. 4to. Bandello was well acquainted

with Greek literature, and made an Italian translation of the 'Hecuba' of Euripides. He also wrote a vast quantity of Italian verses on various subjects. (Mazzuchelli, *Scrittori d'Italia*.)

BANDINELLI, BACCIO, an eminent sculptor, was born at Florence in 1487, and flourished during the brightest period of Italian art. He was the son of a goldsmith of some standing, and as goldsmiths then wrought from their own designs, it is probable that Baccio learnt at least the rudiments of art from his father. At the usual age he became a pupil of Rustici, who was not only a sculptor of celebrity, but the intimate friend of Leonardo da Vinci; and from the latter, Bandinelli is believed to have derived much valuable professional knowledge. His progress under Rustici was rapid, yet he was so far dissatisfied as for a time to turn from sculpture in order to practice painting. But in this art he was far from successful, though he essayed both oil and fresco painting; and he returned to the exclusive practice of sculpture.

Bandinelli, notwithstanding the eminent ability displayed in his works, and the admiration which they generally excited, was far from popular with his brother artists. He is said to have been arrogant, envious, and intriguing. It is however from contemporaries who disliked him that our information respecting him is chiefly derived; and allowance must be made for the spirit in which his character is portrayed. He was especially unfortunate in his opponents. He aspired to be the rival of Michel Angelo, and failing to equal this great genius as an artist, displayed towards him the keenest enmity, which the other returned by some contemptuous criticism, although he admitted Bandinelli's general merits; and Michel Angelo's censure was not likely to be forgotten. But it is chiefly from Benvenuto Cellini that the low estimate of Bandinelli has been derived. They appear to have been constant rivals and bitter enemies; and Cellini in his universally popular autobiography has immortalised the feud. In his usual hyperbolic phraseology, Cellini describes Bandinelli as a compound of everything bad; as excessively ugly naturally, but becoming perfectly hideous, when giving expression to his evil passions; and, in fact, not only as one of the worst men, but also one of the most worthless artists on the face of the earth. Such censure ought to carry with it its own condemnation, especially when, as in this case, there are at any rate the works of the man to appeal to as a refutation of the artistic criticism—and beyond doubt, Cellini, one of the most self-willed, vainglorious, and passionate men who ever existed, was far more competent to decide on the merits of the artist, than of the man whom he regarded as at once a rival and an enemy, and one whom he confesses to having been once on the point of assassinating. Yet it is from Cellini that the biographers have usually taken their estimate of Bandinelli. Vasari however endorses the character given to him for pride and jealousy, and there is no reason to doubt that he had an undue share of both.

Bandinelli was largely patronised by Cosmo de Medici, Francis I., and other eminent personages, during his long career, and produced a great number of works. His most ambitious production was his Heracles and Cacus, executed in rivalry with the David of Michel Angelo: a work of no ordinary character though unfortunate in its competition; it was mercilessly attacked by the other Florentine sculptors. The works by which he is now most favourably known are perhaps his bassi-relievi, especially those which adorn the screen of the high altar in the Duomo at Florence, and some on a pedestal in the Place of San Lorenzo in the same city. The figure of Christ at the Tomb in the church of the Annunziata at Florence, which he completed shortly before his death for his own tomb, is also a work of great ability. His monumental statues of several of the dukes of Florence, his Adam and Eve at the Tree, and others of the numerous productions of his chisel, still to be seen in the palaces and churches of Florence, his statues at Rome and elsewhere, attest his industry, mental vigour, variety, and executive skill. Bandinelli does not take his place in the very first rank of Italian sculptors, but he holds a prominent place in the second rank. All his works are marked by largeness of style, and great knowledge of anatomy and form, and often by grandeur of conception; but there is almost always a strongly marked mannerism, often affectation, and sometimes extravagance. Bandinelli was created a cavalier by Clement VII and Charles V. He died in the beginning of 1560, aged 72 years.

(Benvenuto Cellini, *Vita*, and *Trattato sopra la Scultura*; Vasari, *Vite dei Pittori*; Cicognara, *Storia della Scultura*, &c.)

BANE, or BENN, DR. JAMES, Archdeacon, afterwards Bishop, of St. Andrews. In the former station we find him in 1319, when the pope appointed him and certain other ecclesiastics to determine a dispute between the monastery of Dunfermline and the Bishop of Dunblane respecting tithes. In 1325 he was associated in an embassy to France to renew the league with that crown, and is then called 'Jacobus Bene, archidiaconus Sti. Andrew, et legum professor.' From this, as well as from other sources of information, it appears that the canon law was taught at St. Andrews nearly a century prior to Bishop Wardlaw's foundation there, which Dr. M'Crie regards as the earliest academical institution in Scotland. In 1328 Bane was chosen Bishop of St. Andrews by free election of the canons; but being himself at the court of Rome at the time, he obtained the episcopate by the collation of Pope John XXII., before an account of the election arrived. He was bishop in 1329, and that year, in consideration of

a sum of 200 marks, he granted a charter of favour and protection, with a general acknowledgment of existing immunities, to the priory of Coldingham. (Chalmers, 'Caledonia,' vol. ii. p. 326.) In 1331 he set the crown on the head of King David II., and was soon afterwards constituted Lord Chamberlain of Scotland, then an officer of great importance, and vested with large powers both ministerial and judicial. He died 22nd September 1332 at Bruges, whither he had fled on the success of Edward Baliol, and was buried in the abbey of Eckshot.

BANKS, JOHN, was an attorney in London, but he quitted his profession to write for the theatres. The seven tragedies which he left in print bear dates extending from 1677 to 1696. He must have died at some time in the reign of Queen Anne. Though Banks's dramatic writings do not display much literary ability, they have given excellent scope to the skill of great actors, and were in their day highly popular with the play-going public. The worst has been said of Banks when the censure of Steele in the 'Tatler' is repeated, that, in his best known piece, 'The Unhappy Favourite, or the Earl of Essex,' there is not one good line. His style gives alternate specimens of vulgar meanness and of bombast. But even his dialogue is not destitute of occasional nature and pathos; and the value of his works as acting plays is very considerable. It is admitted by Steele, that the play he speaks of was never seen without drawing tears; and the apt choice of a touching story, and the natural and dramatic arrangement of incidents, to which the success of that play was owing, were much admired by the great German critic Lessing, who bestows on the work an elaborate analysis. The 'Earl of Essex' kept its place on the stage till the middle of last century, when it was superseded by the plays of Jones and Brooke, who successively paid Banks the compliment of stealing from him all the best parts of his tragedy. Of his other works none was so popular, but even his extravagant 'Cyrus the Great' abounds in effective dramatic situations.

BANKS, SIR JOSEPH, an eminent naturalist and traveller, descended from an ancient Yorkshire family, was born in Argyll-street, in the parish of St. James, Westminster, on January 4th, 1743. After studying for awhile under a private tutor, he was sent at nine years of age to Harrow School, and was removed when thirteen to Eton. He is described, in a letter from his tutor, as being well-disposed and good-tempered, but so immoderately fond of play, that his attention could not be fixed to study. At fourteen years of age however his attention was suddenly and very strongly attracted to the study of botany by the beauty of the flowers which adorned the lanes about Eton; and from that time he devoted his leisure hours to botanical studies. In his eighteenth year he was entered a gentleman commoner at Christ Church, Oxford. His love of botany increased at the university, and there his mind warmly embraced all the other branches of natural history. His ardour for the acquirement of botanical knowledge was so great, that, finding no lectures were given on that subject, he obtained permission of Dr. Sibthorpe, the botanical professor, to procure a proper person, whose remuneration was to fall entirely upon the students who formed his class. Banks accordingly went to Cambridge, and brought back with him Mr. Israel Lyons, a botanist and astronomer. This gentleman, many years after, procured, through Mr. Banks's interest, the appointment of astronomer to the voyage towards the North Pole, under Captain Phipps, afterwards Lord Mulgrave. Mr. Banks soon made himself known in the university by his superior knowledge in natural history. He left Oxford in December 1763, after having taken an honorary degree. His father had died in 1761, and he accordingly came into possession of his paternal fortune in January 1764, when he became of age. On May 1, 1766, he was chosen into the Royal Society, and in the summer went to Newfoundland with his friend Mr. Phipps, lieutenant in the navy, who afterwards made the voyage towards the North Pole. The object of this voyage was collecting plants. He returned to England the following winter by way of Lisbon. It was after his return that the intimacy commenced between him and Dr. Solander, a Swedish gentleman, the pupil of Linnæus, who, visiting London with strong letters of recommendation, had been recently appointed an assistant librarian of the British Museum.

Three or four years now elapsed before Mr. Banks again quitted England. The interval was assiduously employed on the objects of his established pursuit: his favourite relaxation was fishing. He frequently passed days, and even nights, on Whittlesea Mere, a lake in the vicinity of his seat, Ravesby Abbey, Lincolnshire, and, when in London, days, and sometimes nights, upon the Thames, chiefly in company with the Earl of Sandwich, who was his neighbour in the country, and quite as ardent in the sport as himself. His intimacy with that nobleman is said to have procured for him the opportunity of gratifying his taste for maritime enterprise, which he had soon after the pleasure of finding within his reach. The commencement of a new reign, the peace of 1763, and the administration of Lord Bute (himself a lover of science), had been marked in England by public efforts to explore those parts of the ocean which were still wholly unknown, or only partially discovered. The South Sea having been visited by Captain Wallace, and the position and general character of the island of Otaheite being ascertained, this spot was determined by the English astronomers to be peculiarly well adapted for observing the transit of the planet Venus over the disc of the sun. The Royal Society having made a representation to this effect to the government,

the idea was entertained and enlarged, so as to embrace a plan for a general voyage of discovery; in pursuance of which the Lords of the Admiralty, at whose head was the Earl of Sandwich, commissioned the 'Endeavour,' under the command of Captain Cook, for the projected service. Banks, by the interest of the Earl of Sandwich, was appointed, in conjunction with Dr. Solander, naturalist to the expedition, in which capacity, attended by two draughtsmen and four servants, he sailed from Plymouth Sound, August 26, 1768.

On touching at Rio de Janeiro, the jealousy of the Portuguese colonial government forbade their exploring the South American shores; but on arriving at Tierra del Fuego they disembarked, and, amid the extreme rigours of the winter season in that extremity of the discovered globe, acquired a splendid variety of botanical specimens. Here, in the midst of a snow-storm, three of the attendants perished of cold, and Mr. Banks and Dr. Solander narrowly escaped with their lives. On the 12th April 1769, after sailing from Tierra del Fuego to Otaheite, they finally anchored on one of the coasts of that island, and here, during a space of four months, devoted essentially to the astronomical objects of the visit, Mr. Banks acquired an intimate knowledge of the natural history of the interior, as well as of the shores and waters of the island. Nor was it only as a naturalist that he became conspicuous at Otaheite: his commanding appearance, frank and open manners, and sound judgment, speedily obtained for him the regard and deference of all classes of the natives, among whom he was frequently the arbiter of disputes. The expedition quitted Otaheite on the 15th of August, and after traversing the seas surrounding New Zealand, and New South Wales, came homeward by the way of Batavia, and reached the Downs on the 12th of June 1771—the whole period of the voyage having occupied nearly three years. Mr. Banks was received in England with the highest marks of respect, and the specimens which he brought, at so much risk and expense, to enrich the science of natural history, excited much interest. On the 10th of August, by his majesty's express desire, Mr. Banks and Dr. Solander, accompanied by Sir John Pringle, then president of the Royal Society, attended at Richmond, where they had the honour of a private interview, which lasted some hours. His majesty, at this time, conceived a liking for the young traveller, which continued unimpaired to the close of his public life.

Soon after the arrival of Mr. Banks in London, he became entangled in a dispute with the relations of one of his draughtsmen, Sydney Parkinson, who had died in the course of the voyage. Parkinson's relations accused Mr. Banks, by implication, of having unfairly taken possession of various effects belonging to the deceased, independently of drawings, which he claimed as the work of his own draughtsman. Parkinson's relatives published his account of the voyage, with a preface, containing their complaints of Mr. Banks's conduct, who however appears not to have considered himself as called on to offer any vindication of his conduct in the affair.

After all the privations and dangers of this voyage, it required no common strength of mind to encounter them a second time. Mr. Banks however, at the solicitation of Lord Sandwich, made this offer to government, which was accepted; and such was the expense of his outfit, and so extensive the preparations he made, that he was obliged to raise money for that purpose. He engaged Zoffany the painter, three draughtsmen, two secretaries, and nine servants, acquainted with the modes of preserving animals and plants; but finding himself thwarted by the comptroller of the navy, respecting the accommodations in the ships (the 'Drake' and 'Raleigh' were commissioned), he gave up in disgust all idea of going upon a voyage in the outset of which he had received such personal ill-treatment. Yet, although he relinquished the voyage, he exerted himself, in every way in his power, to promote the objects of it. Dr. James Lind, a very able physician, had received the appointment of naturalist, with a grant from parliament of 4000*l*. This gentleman, upon Mr. Banks not going, declined the offer, and Dr. John Reinhold Forster and his son, through the interest of Mr. Banks, received it. Upon Mr. Forster's return, his drawings were purchased by Mr. Banks, and placed in his library.

In expectation of being engaged in another voyage of discovery, although not in a king's ship, Mr. Banks, with a view to keep his followers together, made a voyage to Iceland with his friend Dr. Solander. He arrived there in August 1772, and returned in six weeks. The Hebrides, which skirt the north-west coast of Scotland, lay near the track of the voyage, and these adventurous naturalists were induced to examine them. Among other things worthy of notice, they discovered the columnar stratification of the rocks surrounding the caves of Staffa—a phenomenon till then unobserved by naturalists—an account of which was published in the same year from Mr. Banks's 'Journal' by Mr. Pennant in his 'Tour in Scotland' (pp. 261-269). The volcanic mountains, the hot springs, the siliceous rocks, the plants and animals of Iceland, were all carefully surveyed in this voyage; and a rich harvest of new botanical specimens compensated for its toils and expense. But it was not to these objects alone that Mr. Banks confined his inquiries: he purchased at this time a very large collection of Icelandic books and manuscripts, which he presented in 1773 to the British Museum; and he added another collection to it in 1783.

In 1777, when Sir John Pringle retired from the presidency of the Royal Society, Mr. Banks was elected to the vacant chair. The honour

was just such a one as a lover of scientific pursuits, who was at the same time a man of rank and fortune, might with laudable ambition desire; and Mr. Banks devoted himself to its duties with the utmost zeal. His exertions had the effect of procuring numerous valuable communications, and of gaining an accession of persons of rank and talent to the list of members, as well as exciting the whole body to great diligence and activity. From the time of this appointment he gave up all idea of leaving his country, and began to prepare for publication the rich store of botanical materials which he had collected.

In March 1779 Mr. Banks married Dorothea, eldest daughter of William Western Hugessen, Esq., of Provender, in the parish of Norton in Kent; and in 1781 was created a baronet. In 1782 he lost his friend and fellow-labourer Dr. Solander, who died of an apoplectic fit. This loss was a severe blow, and in consequence of it he gave up all intention of proceeding with his botanical work, or of writing anything further than a few short memoirs, published either in a detached form, or as communications to the transactions of societies.

For the first three or four years of Sir Joseph Banks's presidency of the Royal Society all went on harmoniously; but notwithstanding the zeal and assiduity with which he devoted himself to the duties of his office, discontents began to rise against him even amongst the most eminent members of the society. A variety of complaints were industriously circulated in regard to his conduct. Those for which there were perhaps the best grounds were, that the mathematical sciences, the promotion of which was regarded as the chief object of the Royal Society, were studiously kept in the background; and that the president had assumed the exclusive right of nominating new members, and had exerted his power so as to introduce unlearned and trifling men of rank and influence, to the exclusion of the working men of science. This unfriendly feeling was brought to the test in a meeting of the society held on the 8th of January 1784, Dr. Horsley (afterwards bishop of St. Asaph) being one of the most earnest opponents of Sir Joseph. The motion made in favour of Sir Joseph Banks was however carried by a great majority, and the dissension soon after subsiding, the society returned with new zeal and unanimity to its labours.

On the 1st of July 1795 Sir Joseph Banks was invested with the Order of the Bath, and on the 29th of March 1797 sworn of his majesty's Privy Council. In 1802 he was chosen a member of the National Institute of France. Towards the close of life Sir Joseph Banks, who in youth had possessed a robust constitution, was so grievously afflicted by gout as in a great measure to lose the use of his lower extremities. He endured the sufferings of disease with patience and cheerfulness, and died at his house at Spring Grove, June 19, 1820. He was buried at Heston, Middlesex.

All the voyages of discovery which were made under the auspices of government for the last thirty years of Sir Joseph Banks's life had either been suggested by him, or had received his approbation and support. The African Association owed its origin to him; and Ledyard, Lucas, Houghton, and the unfortunate Mungo Park, all partook of the care which he extended to the enterprising traveller. He devised the means of carrying the bread-fruit to the West Indies for cultivation from Otaheite, and the mango from Bengal. He transferred the fruits of Persia and Ceylon also successfully to the West Indies and to Europe. The establishment of our colony at Botany Bay originated entirely with him. In the affairs of the Board of Trade, of the Board of Agriculture, and of the Mint, he was constantly consulted; and he took a leading part in the management of the Royal Gardens at Kew. He was a distinguished promoter also of the interests of the Horticultural Society founded in 1804. His influence was frequently directed to soften to men of science the inconveniences of the long war which followed the French revolution; to alleviate their sufferings in captivity; or to procure the restoration of their papers and collections when taken by an enemy. Baron Cuvier, in his 'Eloge' upon Sir Joseph Banks, mentions that, no less than ten times, collections addressed to the Jardin du Roi at Paris, and captured by the English, were restored by his intercession to their original destination. His purse was always open to promote the cause of science, and his library of natural history always accessible to those who desired to consult it. His weekly conversazioni, during the sittings of the Royal Society, were attended by persons the most distinguished in literature and science, whatever was their rank in life or their country; and during the forty-two years in which he continued President of the Royal Society he was indefatigable as an official trustee in the management of the British Museum; to which institution, after innumerable gifts, he made a contingent bequest of his scientific library, together with his foreign correspondence. The library and correspondence are now deposited in the Museum.

Sir Joseph Banks published two single tracts:—1. 'A Short Account of the Cause of the Disease in Corn, called by the Farmers the Blight, the Mildew, and the Rust,' 8vo, 1805, which was several times reprinted; in 1806, with additions; again, with marginal annotations by an agriculturist (Sir Thomas Hanmer, Bart.) in 1807; and in 1814. 2. 'Circumstances relative to Merino Sheep, chiefly collected from the Spanish Shepherds,' 4to, London, 1809. This tract had been originally communicated to the Board of Agriculture. He communicated numerous papers in the 'Transactions' of the Horticultural Society, the Linnean Society's 'Transactions,' and the 'Archæologia' of the Society of Antiquaries.

Among his manuscripts, and that portion of his library (not scien-

tific) which was removed after his death to Lincolnshire, is a copy of Minshew, enriched with very copious manuscript notes; and a copy of Tuzer's 'Five Hundred Points of Husbandry,' prepared by himself for a new edition.

A catalogue of Sir Joseph Banks's library, compiled by Mr. Dryander (another of Linnæus's pupils), who succeeded Dr. Solander as his librarian, was published in 1800, entitled, 'Catalogus Bibliothecæ Historico-Naturalis Josephi Banks,' auctore Jona Dryander, A.M., Regiæ Societatis Bibliothecario, in 5 vols. 8vo. A limited number only was printed, and it is now a work of considerable rarity. The best likeness of Sir Joseph Banks, in later life, is the statue of him in the hall of the British Museum, by Sir Francis Chantrey.

(*Éloge Historique de M. Banks lu à la Séance de l'Académie Royale des Sciences, le 2 Avril, 1821, 4to; Biographie Universelle, tom. lviii, Supplém., p. 101; Sir Everard Home, Hunterian Oration, Feb. 14, 1822; Genl. Mag., 1771, 1772, and 1820; Lodge, Portraits of Illustrious Persons; Tilloch, Philosoph. Mag., vol. xiv. 1820, pp. 40-46.*)

BANKS, THOMAS, one of the first sculptors of Great Britain, was born on the 22nd of December 1735, at Lambeth. His father, who was land-steward to the Duke of Beaufort, gave his three sons a liberal education. The classical taste which Banks's works exhibit was imbibed with his early studies. Young Banks was placed under Kent, the landscape gardener and architect, as a pupil. The profession for which his father designed him was exclusively that of an architect, but his mind had already taken its unalterable bent; sculpture was his vocation, and no traces are left of his architectural studies, except that when objects connected with that art are introduced in his bas-reliefs they are marked with scientific precision.

In 1768 the Royal Academy was established. Banks, who was then in his 33rd year, and whose style was already formed, had little to learn from such an institution; nevertheless, he became a candidate for its honours, and in 1770 was the successful competitor for the gold prize among many rivals. He exhibited in the same year two distinct designs of Æneas rescuing Anchises from the flames of Troy, and the fertility of his invention was evinced in his different modes of treating the same story. His reputation was greatly increased in the ensuing year by a group of Mercury, Argos, and Iö; and his talents had altogether made such an impression, that it was determined by the members of the Royal Academy to send him to Rome at the expense of that institution.

The time assigned by the Academy to its foreign students for study is three years, with an allowance of about 50*l.* per annum. Accompanied by his wife, Banks arrived in Rome in August 1772, where Gavin Hamilton, the painter, afforded him much assistance in his studies, as he did to other students, as West, Fuseli, Wilton, and Nollekens.

Sir Joshua Reynolds, whose admiration of Michel Angelo knew no limit, had recommended Banks to an unremitting study of the great works in the Sistine chapel; but the sculptor soon perceived, that however magnificent in themselves, those performances were only available to a limited extent for his own art. He therefore studied diligently those pure models of antiquity with which his genius naturally sympathised, and with which Rome abounded. The Italian artists at that time excelled our own in the process of working marble, and Banks took lessons in that branch of his art of Capizoldi, a distinguished professor.

The first work which Banks exhibited in Rome was a relief in marble—Caractacus pleading before Claudius—a performance characterised by grandeur and simplicity. The work however which most excited the admiration of the Roman virtuosi was a statue of Psyche with the Butterfly, which exhibited such grace, symmetry, and classical elegance, that the artist was considered to have rivalled the finest of the great models which had been the objects of his imitation. The acquisition of fame however was attended with no corresponding profit. Banks, after a residence of seven years in Rome, during which he had been much admired and little patronised, returned to England in 1775. Here again disappointment awaited him: Nollekens and Bacon had possession of the ground, nor was his refined and poetic style likely to make way against the plain and popular performances of these established favourites. After an unsuccessful experiment of two years he determined therefore to accept an invitation which had been made him by the court of Russia, and in 1784, being then in his 49th year, he departed for that country. The empress Catherine gave him a flattering reception, purchased his Psyche, which he had brought with him, and placed it in a temple built for the purpose in her gardens at Czarsozelo. The empress commissioned him to make a group in stone called the Armed Neutrality. This work he executed; but being apprehensive, perhaps, that a few more such subjects would be imposed on him, he determined on making a precipitate retreat, and accordingly returned to England.

Shortly after his return, he had completed, what perhaps is the noblest monument of his genius, his figure of the Mourning Achilles, now in the hall of the British Institution. This statue, when sent to Somerset House for exhibition, was by accident precipitated from the car which conveyed it and broken to pieces. The artist, who had concentrated all his powers on this work, and who had founded on it just hopes of awakening public attention, thus beheld his labours destroyed in a moment. He returned home, never mentioned the

accident to his wife or daughter, nor were they led to suspect, by any difference in his demeanour, that a misfortune had happened. He succeeded with much difficulty, and by his brother's assistance, in restoring the statue; and this fine performance, in which pathetic expression is united with heroic beauty, was duly appreciated by the public. Mr. Johnes of Hafod desired to have it executed in marble, and a block was purchased for that purpose; but the patron reconsidered the matter, and determined to have, in its stead, a group of Thetis dipping the infant Achilles. So far the sculptor concurred; but while he was tasking his imagination to furnish a fine ideal head of Thetis, he learned to his astonishment that his pains were unnecessary, and that the face of Mrs. Johnes was to supply his model. Her female infant also was to furnish the head of Achilles. Banks however, who really esteemed his employer, proceeded in his task, and, in spite of its individualities, the work was a beautiful one. Banks, during his after life, was a frequent visitor at Hafod in the summer months, but his practice of sketching and designing was never intermitted, and it was during one of those vacations that he made his beautiful composition of Thetis and her Nymphs consoling Achilles. It is an oval in alto-rilievo; the goddess and her nymphs ascend from the sea like a mist—nor has the buoyant and elastic elegance of those figures been excelled in any work of ancient or modern art. Banks was elected a member of the Royal Academy about this time, and presented to that institution a figure of a fallen giant, which is now in their council-room. His next work was a monument to the daughter of Sir Brooke Boothby, a beautiful and interesting child who died in her sixth year. In this monument, now in Ashbourne church, Derbyshire, she is represented sleeping on her bed, and the figure conveys all the touching interest excited by the sight of infant loveliness doomed to early death.

The last public works on which Banks was engaged were the monuments of Sir Eyre Cooté in Westminster Abbey, and those of Captains Westcott and Burgess in St. Paul's Cathedral. The former was executed for the East India Company; the two latter by order of the Committee of Taste for His Majesty's Government. Banks was great in subjects purely ideal, but he failed when he attempted to apply the principles proper to that class of art to the plain realities of life. The two captains are represented nearly naked, at once an offence to correct taste and to popular feeling. In public monuments, of whatever magnificence, common-place propriety should form a large ingredient; and it was by the tact with which he combined those qualities that Bacon, the contemporary of Banks, succeeded in bearing away the general suffrage, however inferior to his rival in lofty imagination and general power of intellect. It should be added, that the allegorical figures in those monuments, and a Mahratta captive in that of Sir Eyre Cooté's, are finely conceived, and in every way worthy of the sculptor's reputation.

With the monument of Captain Westcott, which was finished in 1805, Banks terminated his career. He died on the 2nd of February 1805, in his 70th year, and was buried in Paddington churchyard. A plain tablet was erected to his memory in Westminster Abbey.

BAPTIST, JOHN BAPTIST MONNOYER, was born at Lisle, in the year 1635. He commenced his studies at Antwerp, with the intention of becoming an historical painter; but, growing diffident of his powers in that branch of art, he had the good sense to relinquish it, and to devote himself to a humbler walk, chiefly the representation of fruit and flowers, in which he showed great talent and acquired high reputation. He went early to Paris, where the spirit and novelty of his style soon attracted attention; and he was engaged to ornament the palaces of Versailles, Meudon, Marly, and Trianon. He was elected into the Academy in 1663. At the invitation of Lord Montague, then English ambassador at Paris, he accompanied that nobleman to England, where he commenced his practice by decorating Montague House, which became afterwards the British Museum, with a beautiful series of embellishments. When the old house was pulled down, after the erection of the present British Museum, these paintings were detached from the walls and sold. Baptist continued in this country nearly twenty years, enjoying uninterrupted patronage; and his works form conspicuous ornaments in the mansions of the various nobility and gentry by whom he was employed. There is at Kensington Palace a looking-glass which he embellished with garlands of flowers in his happiest manner for Queen Mary II., who was so pleased with observing the progress of the work, that she sat by during nearly the whole time that he was engaged on it.

Baptist was more employed in ornamenting halls, staircases, and the interior of apartments, than in painting detached pictures. The boldness and vivacity of his style are well adapted to that sort of embellishment; but even in his easel-pictures there is merit enough to rank him among the most eminent practitioners in his branch of art. His compositions of flowers are like the accidental combinations of nature—varied, fluctuating, and graceful; his execution is fluent and spirited; his touch firm and discriminating; and his colouring has much of the freshness of reality.

Baptist died in 1699, aged 64. He left a son, Anthony Monnoyer, called Young Baptist, who practised in his manner, but who, although by no means destitute of talent, fell far short of the excellence attained by his father.

BAPTIST, JOHN GASPAR, was a native of Antwerp, and a pupil

of Boschaert. He came to England during the civil wars, and served in Lambert's army, but after the Restoration returned to his original profession, and was much employed by Sir Peter Lely, in painting his draperies and back-grounds. He worked occasionally also for Kneller and Riley. He was not without original talent, and made designs for tapestries which evince considerable skill in drawing. There is a portrait of Charles II. in St. Bartholomew's Hospital by this artist. He died in 1691.

* BARANTE, AMABLE-GUILLAUME-PROSPER, BARON DE BRUGIÈRE, is the son of Claude Ignace, Baron Brugière, a barrister and prefect of Vaud and of Geneva. Amable was born at Riom, in the department of Puy-de-Dôme, on June 7, 1782. He commenced his studies in the military school at Effiat. On its being closed by the revolutionary administration, his father instructed him in classics, and in 1798 he was placed in the Polytechnic school at Paris. Here he continued two years, and in 1802 entered the civil service of his country; placed at first in a subordinate situation, he rose rapidly. In 1806 he was appointed auditor to the council of state, and under this title was entrusted with various missions to Spain, Poland, and Germany. In 1808 he was made prefect of Vienne; in 1813 prefect of Nantes; but after the 20th of March 1815, he sent in his resignation. On the return of Louis, after the Hundred Days of Napoleon, he was appointed councillor of state, and secretary of the home department. In the same year he was chosen deputy for the departments of Puy-de-Dôme and Loire-Inférieure. In 1819 he was nominated a peer of France, and in the following year he was offered the office of ambassador to Denmark, which he did not accept; exercising indeed no other political functions than those of a peer of France until 1830. After the revolution of July, he resided as ambassador at the court of Sardinia, and in 1835 removed in the same capacity to the court of Russia. Since the revolution of February 1848, he has retired wholly from public life, and resides in Auvergne.

Whatever time M. de Barante has been able to abstract from his public functions, has been sedulously devoted to literary pursuits. In 1808 he published anonymously the 'Tableau de la Littérature Française au dix-huitième Siècle,' a work which passed through several editions; and which, brief as it is, is a masterly review of the literary spirit of that period. In 1821 he issued a translation of the works of Schiller; and in the translation of Shakspeare, published by M. Guizot, that of 'Hamlet' was furnished by M. Barante. From 1824 to 1828 he published successively his most important work, in twelve volumes, the 'Histoire des Ducs de Bourgogne,' valuable alike for its accuracy, its impartiality, the laborious research displayed in it, and the lucidity of its style. These qualities have placed him in the first rank of modern French historians. In 1850 he issued a volume entitled 'Questions Constitutionnelles;' and since that 'Histoire de la Convention Nationale,' in six volumes. M. de Barante was elected a member of the French Academy in 1828, and has written notices of Count Mollin and of Count A. St. Priest.

(*Nouvelle Biographie Universelle.*)

BARATIE'R, JOHN PHILIP, born in January 1721, at Schwabach, in the Margraviate of Ansbach, was the son of Francis Baratier, pastor of the French Protestant Church of Schwabach. His father, who was a man of much information, devoted all his leisure time to his son's education. At four years of age the child spoke Latin with his father, French with his mother, and German with the house servant. Between four and five years of age he began to study Greek, and in fifteen months was able to read the Scriptures in that language, and to translate them into Latin. Towards the end of his sixth year he began Hebrew, in the study of which he spent three years. He then plunged into Rabbinical literature, and read with great avidity the books of the Cabbalists, Talmudists, commentators, &c. At nine years of age he made a dictionary of the most difficult Hebrew and Chaldaic words. He next undertook the translation of the travels of Benjamin of Tudela, a Hebrew writer of the 12th century. Two Latin translations of this work, one by Arias Montanus and the other by Constantin Lempereur, Leyden, 1633, were found to be incorrect. Baratier wrote his in French, adding to it copious notes, and eight dissertations at the end, upon subjects of a singular nature to be treated of by a child eleven years old. He finished his work in about six months in 1732, but it was not published till 1734, in two vols. small 8vo, Amsterdam. After this Baratier turned his attention to theological studies, and especially to the Greek Fathers and the early Councils. After some time he undertook to refute Samuel Crellius, a celebrated Unitarian divine, who had written a book styled *Artemonius*. The title of Baratier's reply will show the subject of the controversy:—'Anti-Artemonius, seu Initium Evangelii S. Johannis Apostoli ex Antiquitate Ecclesiastica Adversus L. M. Artemonii, Neo-Photiniani, Criticam Vindicatum atque Illustratum; cui in Fine accedit Dissertatio de Dialogis tribus, vulgo Theodoro tributis.' Nuremberg, 1735. Frederic William, king of Prussia, having appointed Baratier's father to the French Protestant church at Stettin, the family left Schwabach in the beginning of 1735. In passing through Halle, young Baratier, whose fame had long before reached that university, was made Master of Arts, after undergoing an examination and sustaining a public disputation. On his arrival at Berlin the king sent for him, and was delighted with his conversation. The Royal Society of Sciences at Berlin named Baratier one of its members.

The king urged upon both father and son the propriety of the latter applying himself to some regular profession, and he suggested that of the law, for which purpose the family returned to Halle in April 1735. During the next four years Baratier attended the courses of the four law professors of civil, canon, public, and feudal law. He followed his legal studies without any particular inclination for them, with the exception of public law, in which he seemed to take an interest. He at the same time found leisure to pursue his more favourite studies. He had begun a 'History of the Heresies of the Anti-Trinitarians,' which he left in manuscript. Several dissertations also on various subjects of philology, history, and antiquities, were inserted in the 'Bibliothèque Germanique.' The last work he published was on the succession of the early bishops of Rome: 'Disquisitio Chronologica de Successione antiquissima Episcoporum Romanorum, inde a Petro usque ad Victorem.' 4to. Utrecht, 1740. This was the beginning of a great work which he designed on the history of the first centuries of the church. He also began a 'History of the Thirty Years' War.'

Baratier's chest was naturally weak: a cold which he took brought on an obstinate cough, and in October 1739, he spat blood. In September 1740, he became much worse; his weakness was extreme, and he could no longer read, which was to him the greatest privation. On the 5th of October he expired in his arm-chair, at the age of nineteen years and eight months. The life of this extraordinary boy was written by Mr. Formey, from the materials furnished by his father, 12mo, Halle, 1741, and a second edition was published at Frankfurt and Leipzig in 1755. At the end is a long catalogue of the numerous works which he left in manuscript, mostly unfinished.

BARBARO'SSA, HORUSH, was born in the island of Metelin (Mytilene), about the year 1474, of Christian parents. His father, who followed the trade of a potter, had a family of three sons and four daughters. The eldest son, when twenty years of age, went on board a Turkish privateer, embracing, at the same time, the Mohammedan faith, where he assumed the Turkish name of Horush. Having served for several years, during which he distinguished himself by his bravery and intelligence, he was appointed commander of a galliot, fitted out for the purpose of cruising in the Archipelago against the merchant-vessels of nations at war with the Porte. After he came out of the Dardanelles, he persuaded the crew that they would have a better chance and be more at liberty, if, instead of cruising in the Archipelago under the eyes of the Sultan's officers, they took their station off the coast of Africa. Having met another Turkish galliot, he induced the master and crew to cruise in company with him and under his direction. Arriving at Goletta, the harbour of Tunis, in 1504, he was well received by the reigning Bey, Muley Mohammed, who was under apprehensions from the power of Spain. Horush having sailed in his own galliot for the coast of Italy, fell in, off the island of Elba, with two large papal galleys richly laden, and bound from Genoa to Civitavecchia, which he captured without resistance, and returned to the coast of Tunis with his two prizes.

Barbarossa's fame now rose high along the coasts of the Mediterranean, and many Turkish and Moorish adventurers applied to serve under him. In the following year he surprised and took a large Spanish ship with money and soldiers on board. The fort of Goletta was his head-quarters; there he disposed of his prizes, paying a tithe to the Bey of Tunis. Having built several more galliots, he assembled a squadron of eight good ships, two of which were commanded by his brothers. He was successful in his cruises, and in the course of a few years he grew enormously rich. The Christian sailors, whose terror he had become, gave him the name of Barbarossa, from the colour of his beard, which was red; or, as others say, from Baba (father) Horush, as he was called by his own sailors. In 1510 the Bey of Tunis gave him the government of the island of Jerbi, which had been attacked shortly before by a Spanish expedition, though without success; and he accordingly made Jerbi his head-quarters. In 1512, when his squadron consisted of twelve sail, he received a message from the Moorish king of Bujelah, near Algiers, who had been dispossessed of his town by the Spaniards, and had taken refuge in the mountains. Horush having mustered 1000 well-armed Turks, sailed for Bujelah, landed near the place, and being joined by a body of natives, attacked the town; but was repulsed, after having had his left arm carried off by a cannon-ball. On his way homeward he seized a Genoese vessel richly laden, which so incensed the senate of Genoa that they sent Andrea Doria with a squadron to attack Goletta, where Horush's galleys were lying under the command of his brother Hadher, afterwards famous under the name of Khair Eddin. Doria having landed some troops, attacked Goletta by sea and by land, and obliged Hadher to fly, after having sunk six of his galleys: Doria carried away the rest. The two brothers however soon refitted a squadron, and in 1513 Horush made a second attack on Bujelah, but was again repulsed; he then repaired to the harbour of Jijil, in that vicinity, where he found means so to ingratiate himself with the inhabitants, that they proclaimed him their sovereign. It had been long the object of Horush's ambition to obtain an independent sovereignty on the northern coast of Africa. The Spaniards at that time possessed the little island of Algeiras in front of Algiers, greatly interrupted its trade, and levied a tribute. The Algerines called to their assistance an Arab Sheik from the interior, who in his turn applied to Horush for assistance. Horush after some minor successes attended to the Sheik Selim's invitation,

and repaired with his faithful Turks to Algiers, where he was received with great honour, and lodged in Selim's palace. Here he soon began to assume the tone of a master, while his men lived upon the citizen. Selim, dissatisfied at this, escaped out of the town and joined his Arab countrymen inland; but Horush enticed him to an interview, and treacherously put him to death; after which the Turks, having seized on the forts and gates of the town, proclaimed Horush Sultan of Algiers. This happened in 1516, and was the beginning of the Turkish dominion over Algiers. Several conspiracies were formed against the usurped power of Horush, but they all failed, and the conspirators were punished with severity. In 1517 a Spanish armament came into the Bay of Algiers, and landed some troops; but a storm dispersed the ships, and the men who had landed were either put to death or taken as slaves. The mulatto king of Tennes also attacked Algiers by land, but was defeated, and obliged to escape into the mountains, and Tennes submitted to Horush.

The next victory of Horush was over the Arab king of Tlemsen, the most powerful chief in the country. After their king's defeat, the people of Tlemsen cut off his head, and opened their gates to the conqueror. Horush now reigned over the greater part of the present state of Algiers, and as far west as the frontiers of the kingdom of Fez. The Spaniards of Oran, alarmed at the rapid success of such an enterprising chief, demanded reinforcements from Spain, and Charles V., in 1518, sent 10,000 men under the Marquis de Comares, with orders to drive Horush out of Tlemsen. Horush was forced to retreat, hoping to reach Algiers, but on the banks of the river Maileh he was overtaken by the Spaniards, totally defeated, and lost his life, after fighting desperately. Horush, or Barbarossa, as he is generally called, was forty-four years of age when he fell, fourteen years of which he had spent on the coast of Barbary. He left no children. Merciless as he was to his enemies or rivals, and totally unprincipled and reckless in the pursuit of his ambitious schemes, he was not wantonly cruel. Father Haedo, who was at Algiers in the latter part of the same century, renders full justice to Barbarossa's personal qualities. The quality which most distinguished him, and which insured his success, was his extraordinary activity and rapidity of movements, which surprised his enemies before they were prepared to resist him.

(Haedo, *Topografía e Historia de Argel*; Marmol, *Descripcion de Africa*; Morgau, *History of Algiers*.)

BARBAROSSA, KHAIR EDDIN, brother of the preceding. His name was Hadher, but in the course of his successful career he was honoured by Sultan Solymán with the title of Khair Eddin, that is, 'the good of the faith.' He is also styled by historians Barbarossa II., having succeeded his brother in the sovereignty of Algiers, and being known at sea by the same formidable name. On the news of Horush's death, the Turks at Algiers immediately proclaimed his brother. The following year (1519) a new armament from Spain appeared before Algiers, but it met with the same fate as the former. Hadher, finding himself insecure on his throne, made an offer of the sovereignty to Selim I., sultan of Constantinople, on condition of being himself appointed pasha or viceroy, and of receiving a reinforcement of troops from the sultan. Selim accepted the offer, and sent him in 1519 his firman of appointment as pasha or regent of Algiers, and a body of 2000 janissaries. From that time Algiers became subject to the high dominion of the Porte, and the Turkish supremacy over the natives was firmly established. In 1530, Hadher, after many attempts, took at last the little fort on the island opposite Algiers, and sentenced the Spanish commander to a cruel death. He then joined the island to the mainland by a mole, which rendered the harbour of Algiers safe. In this labour he employed a great number of Christian slaves: he also fortified the town by sea and by land. He made several expeditions inland against the Beduins and Berbers, and against the Spaniards of Oran: Bona also surrendered to him. Meantime his galleys infested the Mediterranean, and especially the coasts of Spain.

In 1532, the people of Tunis being dissatisfied with their king, Muley Hassan, invited Barbarossa, who landed at Goletta, drove Hassan away, and took possession of Tunis in the name of Solymán, sultan of the Turks. Solymán, in order to oppose Andrea Doria, whom Charles V. had made his admiral, and who was then scouring the seas of the Levant, appointed Barbarossa his 'pasha of the sea,' or great admiral. Barbarossa, leaving the regency of Algiers to his friend Hassan Aga, a Sardinian renegade, repaired to Constantinople, where he assumed the command of the Turkish fleet. In 1534 he sailed for the coast of Italy, passed the Strait of Messina, and, landing on several points of the kingdom of Naples, ravaged the country and carried away an immense booty. He assailed in the night the town of Fondi, scaled the walls and plundered it, carrying away the inhabitants as slaves. Barbarossa, returning to Tunis, was soon after attacked by Charles V. in person, with Admiral Doria, Ferrante Gonzaga, and other captains. Doria took Goletta, and Barbarossa shut himself up in Tunis; but the numerous Christian slaves in the town having revolted, he was obliged to escape, and the troops of Charles V. entered Tunis, which was barbarously pillaged. Doria next took Bona, and placed a garrison in it. Barbarossa having reached Algiers, put to sea again in his own galleys, and made many prizes off the coast of Spain. In 1537 Solymán collected a large force at La Vallona, on the coast of Albania, for the invasion of the kingdom of Naples; and Barbarossa repairing there with the fleet, landed part of the troops near Castro,

in the province of Otranto, took the town, and devastated the country. Disputes broke out soon after between Barbarossa and some Venetian ships of war which were sailing past the Turkish fleet; and this led to a war between Venice and the Porte, in which Barbarossa attacked Corfu, and ravaged the island, but failed in taking the town. He however plundered several of the islands in the Archipelago. In the following year he sailed to the Adriatic, where the fleets of Charles V., Venice, and the Pope, had assembled at Corfu; but Barbarossa having retreated to the Gulf of Arta, Doria, in command of the united fleet, did not venture to attack him. This affair has been magnified by the Turkish writer of the 'Tarikh al Othmaniah' ('History of the Ottomans') into a defeat of Doria by Barbarossa. In the next year, Barbarossa took by storm Castelluovo, in the Gulf of Cattaro, where Doria had left a Spanish garrison, which was all cut to pieces. In 1542 Francis I. of France having made an alliance with Sultan Solymán against Charles V., the Turkish prince sent Barbarossa into the Mediterranean with a fleet of 180 galleys and 10,000 soldiers, the whole of which force he put at the disposal of the king of France. Barbarossa began by his usual course of devastation against the unfortunate kingdom of Naples. He burnt Cotrone, Reggio, and other towns, where his men committed the most horrible excesses, in the presence of the French envoy, who was on board Barbarossa's admiral's ship. Barbarossa subsequently sailed for Marseille, where he was received with great honour by the governor, Count of Enghien. A French squadron of forty ships having joined the Turks, they sailed on the 5th of August 1543, to attack the town of Nice, which belonged to the Duke of Savoy. Nice was obliged to surrender by capitulation, but the castle continued to defend itself until the report of Doria's approach induced Barbarossa to raise the siege. He however plundered the town in the night, against the articles of the capitulation, burnt part of it, and carried off 5000 of the inhabitants. Soon after, the French and the Turks quarrelled, and Barbarossa resolved to leave his allies and return to the Levant. On his way back he plundered the islands of Elba and Giglio, with those of Procida and Ischia, the coast of Policastro, the island of Lipari, the town of Cariati in Calabria, and other places. Barbarossa returned to Constantinople in 1544; and he does not seem to have gone to sea afterwards. He died in 1546, and was buried at Beshiktaah, near the entrance of the Black Sea, where he had a country-house, and where his tomb was still to be seen not many years since.

BARBAULD, ANNA LÆTITIA, was the eldest child and only daughter of the Rev. John Aikin, D.D., and the sister of John Aikin, M.D. Miss Aikin was born on the 20th of June 1743, at the village of Kibworth Harcourt in Leicestershire, where her father was at that time master of a boys' school. She enjoyed the advantage of having in both her parents persons willing and able to assist in developing the natural talents of their daughter.

From her childhood Miss Aikin manifested great quickness of intellect. At a very early age she acquired such a knowledge of Latin as to be able to read works in that language with advantage, besides which she gained some acquaintance with Greek. The quiet retirement of Kibworth Harcourt afforded full opportunity for the indulgence of this taste, and the removal of her father with his family to the town of Warrington when she was fifteen years of age, happened soon enough to prevent any bad effects from the seclusion in which her childhood had been passed. Miss Aikin had early shown a taste for poetry, but it was not until the year 1773, when she was thirty years of age, that she yielded to the persuasions of her brother, and consented to the publication of a selection from her poems. The result fully justified this step, for within the year of its publication four editions of the work were called for. This success at once established her reputation, and Miss Aikin was induced, also in 1773, to publish a volume in conjunction with her brother, under the title of 'Miscellaneous Pieces in Prose,' by J. and A. L. Aikin; a work which also met with a favourable reception, and has been frequently reprinted. The respective contributions of the authors have never been distinguished or correctly assigned.

In 1774 Miss Aikin married the Rev. Rochemont Barbauld, a dissenting minister, descended from a family of French Protestants, who had taken refuge in England in the reign of Louis XIV. Mr. Barbauld was educated in the academy at Warrington, and at the time of his marriage had been recently appointed to the charge of a dissenting congregation at Palgrave in Suffolk, near Diss in Norfolk, where he had announced his intention of opening a boarding-school for boys. This undertaking proved speedily successful, a result which must in great part be attributed first to the reputation and afterwards to the active exertions of Mrs. Barbauld. After a few years thus devoted, Mrs. Barbauld was solicited to receive several little boys as her own peculiar pupils; and among this number may be mentioned Lord Denman, the late Chief Justice of England, and the late Sir William Gell. It was for the use of these her almost infant scholars that she composed her 'Hymns in Prose for Children.' In 1775 Mrs. Barbauld published a small volume, entitled 'Devotional Pieces, compiled from the Psalms of David, with Thoughts on the Devotional Taste, and on Sects and Establishments.' About the same time also she wrote that admirable little volume, her 'Early Lessons,' a publication which has ever since been a standard work. At the time of its first appearance there was a multitude of books professedly written

for children, but not adapted to the comprehension of a child of very tender age, that was not at the same time injurious from its folly or puerility.

The success of the school at Palgrave remained unimpaired, but the unceasing call for mental exertion on the part of the conductors which its duties required, so much injured their health, that after eleven years of unremitting labour an interval of complete relaxation became necessary; and Mrs. Barbauld accompanied her husband in the autumn of 1785 to Switzerland, and afterwards to the south of France. In the following year they returned to England, and early in 1787 took up their residence at Hampstead, where for several years Mr. Barbauld received a few pupils.

In 1790 Mrs. Barbauld published an eloquent and indignant address to the successful opposers of the repeal of the Corporation and Test Acts. In the following year was written her poetical epistle to Mr. Wilberforce on the rejection of the bill for abolishing the slave trade. In 1792 she published 'Remarks on Mr. Gilbert Wakefield's Inquiry into the Expediency and Propriety of Public or Social Worship;' and in 1793 she produced a work of a kind very unusual for a female—a sermon, entitled 'The Sins of Government Sins of the Nation.' In all these works Mrs. Barbauld showed those powers of mind, that ardent love for civil and religious liberty, and that genuine and practical piety by which her whole life was distinguished. In particular her remarks on Mr. Wakefield's 'Inquiry' may be noticed as being one of the best and most eloquent and yet sober appeals in favour of public worship that has ever appeared.

In the notice of Dr. Aikin, it is mentioned that his sister supplied several contributions to the 'Evenings at Home.' These contributions were fourteen in number; and they comprise all that Mrs. Barbauld published till 1795, when she superintended an edition of Akenside's 'Pleasures of Imagination,' to which she prefixed a critical essay. In 1797 she brought out an edition of Collins's 'Odes,' with a similar introduction.

Mr. Barbauld became, in 1802, pastor of a Unitarian congregation at Newington Green, and at this time he changed his residence to Stoke Newington. In 1804 Mrs. Barbauld published a selection of the papers contained in the 'Spectator,' 'Guardian,' 'Tatler,' and 'Freeholder,' with a preliminary essay, which has been much admired for its elegance and acuteness. In the same year Mrs. Barbauld prepared for publication a selection from the correspondence of Richardson the novelist, prefixing a biographical notice of him and a critical examination of his works.

About this time Mrs. Barbauld's husband, to whom she had been united for more than thirty years, fell into a state of nervous weakness, and at last died in November 1808. From the dejection occasioned by this loss Mrs. Barbauld sought relief in literary occupation, and undertook the task of editing a collection of the 'British Novelists,' which was published in 1810. To these volumes she contributed an introductory essay, and furnished biographical and critical notices of the life and writings of each author. In the next year she composed and published the longest and most highly-finished of her poems, entitled 'Eighteen Hundred and Eleven.' It is written throughout with great power and in harmonious language; its descriptions are characterised by deep feeling and truth, and its warnings are conveyed with an earnestness which is the best evidence of the sincerity of the author.

Although arrived at years which are assigned as the natural limit to human life, Mrs. Barbauld's fancy was still bright, and she continued to give evidence, by occasional compositions, of the unimpaired energy of her mind. Her spirits were greatly tried during the latter years of her life by the loss of her brother, who died in 1822, and of several cherished companions of early days who quickly followed. Her constitution, naturally excellent, slowly gave way under an asthmatic complaint; and on the 9th of March 1825, after only a few days of serious illness, she died, in the eighty-second year of her age. Her collected works, with a memoir prefixed, were published by her niece, Mrs. Lucy Aikin, shortly after her decease.

BARBERINI, an Italian family, originally from Florence, which was raised to a high rank among the Roman nobility in consequence of the elevation of one of its members, Cardinal Maffeo Barberino, to the papal chair in 1623, when he assumed the name of Urban VIII. [URBAN VIII.] Urban had three nephews, two of whom were made cardinals, and the third prefect of Rome. Under the long pontificate of their uncle the three brothers Barberini attained great power at Rome, where they held the chief business of the government in their hands; and they had also considerable influence in foreign courts. They became possessed of the fief of Palestrina, which had formerly belonged to the Colonna family; and they aspired also to the possession of the duchy of Castro and Ronciglione, which belonged to the Farnese family, who had received it as a fief from Pope Paul III. This led to a war between the pope and Edward Farnese, duke of Parma, who was joined by the dukes of Modena and of Tuscany, and by the republic of Venice. Cardinal Antonio Barberini commanded the papal troops, and showed considerable skill and personal courage. In 1644 peace was made by the interposition of France, and Castro was restored to the Duke of Parma. After Urban's death in 1644, Innocent X., who succeeded him, and who partly owed his elevation to the influence of the two cardinals Barberini, instituted proceedings against

them for peculation and abuse of power during their uncle's pontificate. The Barberini took refuge in France, where by Cardinal Mazarin's influence Cardinal Antonio Barberini, the eldest brother, was made archbishop of Rheims and great almoner of France in 1645. In 1652 Innocent X. again admitted the Barberini to his favour, and they returned to Rome, where all judicial proceedings against them were dropped. Lucrezia Barberini, niece of the two cardinals, married, in 1655, Francis I. d'Este, duke of Modena. The Barberini have ever since ranked among the first Roman nobility, several individuals of their name having been successively raised to the rank of cardinals, while the lay representative of the family bears the title of Roman prince, and is possessed of estates at Palestrina, Albano, and in other parts of the Roman state.

BARBEYRAC, JEAN, an eminent jurist, was born at Beziers in Lower Languedoc, on the 15th of March, 1674. His parents were Calvinists, and upon the revocation of the Edict of Nantes in 1686 they took up their abode at Lausanne in Switzerland, at which place Barbeyrac was educated. His taste early led him to historical and juridical studies, and induced him to attach himself to the faculty of jurisprudence. In 1697 he became teacher of the belles lettres in the French college at Berne, where he remained about fourteen years. During this period he published, in periodical repositories of France and Holland, several small treatises upon subjects connected with natural and international law; and in 1709 appeared the first edition of his 'Traité du Jeu,' which excited much attention, and gave him considerable reputation. A posthumous edition of this work, enlarged and improved, was published at Amsterdam in 1737. This singular book consists of an elaborate and erudite dissertation, applying at great length the rules of religion, morals, and law, to establish the proposition that play, or games in general, and even playing at games of chance, are not in themselves unlawful occupations. Barbeyrac also published French translations of Puffendorf's 'Abridgment of the Law of Nature and Nations;' and of two discourses of Gerard Noodt, a learned professor of law at Leyden, 'De Jure Summi Imperii et Lege Regiâ,' and 'De Religione ab Imperio Jure Gentium Liberâ;' all of which were accompanied with laborious and useful annotations by Barbeyrac. In 1711 he was appointed by the Senate of Berne to the chair of law and history, then lately established at the College of Lausanne. His inaugural oration, 'De Dignitate et Utilitate Legis et Historiarum,' was published, at the request of the senate of the college, in the following year. In 1713 Barbeyrac became a member of the Royal Society of Sciences at Berlin, and in 1714 he commenced a new version of Grotius's treatise, 'De Jure Belli et Pacis,' with notes, which display much historical research and a profound acquaintance with the law of nations. By this work, and also by his edition of Puffendorf, he established his reputation as a jurist throughout Europe; and in 1717 he accepted an invitation to become professor of law at the University of Groningen. A few years after his establishment at Groningen he compiled his 'Histoire des Anciens Traités,' consisting of a chronological collection of ancient treaties from the earliest times of which there are any authentic records to the death of Charlemagne, with full historical notes and illustrations: it was published by him as a supplemental volume to the 'Corps Universel du Droit des Gens,' and appears to be by far the most useful of his works. He also translated into French Bynkershoek's 'Traité du Juge compétent des Ambassadeurs.' Barbeyrac took an active part in a controversy between the Dutch East India Company and certain merchants of Ostend and other parts of the Austrian Netherlands, which was carried on with considerable zeal about the year 1725, in reference to the right of trading to India. Barbeyrac in his tract, which is entitled 'Défense du Droit de la Compagnie Hollandaise des Indes Orientales contre les nouvelles Préentions des Habitans des Pays-Bas Autrichiens,' defends the exclusive title of the Dutch Company. Barbeyrac wrote also several tracts and some anonymous pieces inserted in the 'Journal des Savans' and other literary periodicals. Three discourses, delivered on academical occasions at Lausanne in the years 1714, 1715, and 1716, were also published. Barbeyrac died March 3, 1744.

BARBOU, the name of a family of printers, who long rendered themselves famous for the correctness as well as elegance of the works which issued from their presses.

John Barbou, the first of the name who is known, was settled at Lyon, where he printed the works of Clement Marot, in the Italic letter, in small 8vo, 1539. Hugh Barbou, son of John, left Lyon, and established himself at Limoges, where, in 1580, he produced a beautiful edition of Cicero's 'Letters to Atticus,' with notes by Simon Dubois lieutenant-general of Limoges.

The first of the Barbous who settled at Paris was John Joseph, who became a bookseller there in 1704. He died in 1752. His brother Joseph became a bookseller in 1717, and a printer in 1723. He died in 1737, when his widow succeeded him, but parted with the printing-office in 1750.

Joseph Gerard Barbou, nephew of the two Barbous last-mentioned, who became a bookseller in 1746, took in 1750 the printing-office of his uncle Joseph's widow, and soon after engaged in the series of classics which bears his name, and which was in fact the renewal of a series begun in 1743 by M. Lenglet Dufresnoy, and printed by Coussetier, as rivals to the classics which had been published at an earlier day by the Elzevirs, though of a size somewhat larger.

There is a complete set of the Barbon Classics in the Royal Library at the British Museum. The following is a chronological list of them:—Catullus, Tibullus, and Propertius, 1754; Lucretius, 1754; Phædrus, 1754; Martial, 2 tom. 1754; Eutropius, 1754; 'Cæsar's Comment.' 2 tom. 1755; Quintus Curtius, 1757; Plautus, 3 tom. 1759; Tacitus, 3 tom. 1760; 'Selecta Senecæ Opera' (in Gall. vers.), a French version with a Latin title, 1760; Ovidius, 3 tom. 1762; Virgilius, 2 tom. 1767; 'Lucani Pharsalia (cum. Suppl. Tho. Maii),' 1767; Cornelius Nepos, 1767; 'Ciceronis Opera,' 14 tom. 1768; 'Plinii Sec. Epist.' 1769; Justinus, 1770; Sallustius, 1774; Horatius, 1775; Titus Livius, 7 tom. 1775; 'Persii, Jovenalis, et Sulpicii Sat.' 1776; Velleius Paterculus, 1777; 'Plinii Hist. Naturalis,' 6 tom. 1779. Besides these, J. G. Barbour printed a Latin Testament, and various works of less note, chiefly between 1757 and 1789, when he resigned his business to his nephew Hugh Barbour, who dying in 1809, his heirs disposed of the business of this the last of the Barbours to M. Auguste Delalain.

Two works from the press of Joseph Gerard Barbour (in similar type and size with the classics) affect to have been printed in London: 'Sarcotis et Caroli V. Panegyris,' 1771; and 'Erasmii Moris Encomium,' 1777. The latter undoubtedly, and probably the former, was a prohibited book.

BARBOUR or BARBER, JOHN, a divine, historian, and one of the best poets of Scotland, was born, as is supposed, at Aberdeen, according to Sir David Dalrymple, about the year 1316 ('Annals,' vol. ii, p. 3); according to other authorities, in or about the year 1380. Having received a learned education, he entered into holy orders, and was promoted by king David II. to the archdeaconry of Aberdeen in 1356. But in order still further to prosecute his studies, he prevailed upon his sovereign to apply to king Edward III. for permission to reside for a time at Oxford; the letter of safe-conduct for which, with three scholars in his company, all coming to perform scholastic exercises, is preserved in Rymer's 'Fœdera' (old edit., tom. vi, p. 31: see also the 'Rotuli Scotiæ,' vol. i, p. 808). By a deed dated at Fetherin in Aberdeenshire, September 13, we find him appointed in the same year, by the Bishop of Aberdeen, one of his commissioners to deliberate at Edinburgh upon the ransom of the Scottish king.

Although the archdeacon was famed for his extensive knowledge in the philosophy and divinity of the age in which he lived, he gained a greater reputation even at that time by his poetry, in which he composed a history of the life and glorious actions of King Robert Bruce. Dr. Henry says it was written "at the desire of King David Bruce, his son, who granted Barbour a considerable pension for his encouragement, which he generously bestowed on an hospital at Aberdeen;" but Dr. Jamieson ('Memoir of Barbour,' prefixed to 'The Bruce,' p. ix.) shows that, although Barbour had two small pensions, there is no evidence that these were granted by King David, or that Barbour was ever commanded by that monarch to write the life of his father. Barbour states in the work itself (b. ix., v. 890) that he finished it in 1375. While engaged in its composition he obtained permission and safe-conduct from Edward III. in 1365 to travel through England into Wales, with six horsemen, his attendants. Dr. Jamieson fixes the date of Barbour's death, with seeming accuracy, at the close of the year 1395.

The value of Barbour's work, as an historical record, was early acknowledged (see the continuator of Fordun's 'Scotichronicon,' lib. xii., c. 9, and Wyntown); and it is remarkable that, though Barbour was a Scotchman, his versification and language are quite as intelligible to a modern English reader as that of any other poet of the 14th century, his great contemporary Chaucer scarcely excepted. The first known edition of 'The Bruce' was published at Edinburgh in 1618 in 12mo, but an earlier one is believed to have existed. (See Jamieson's 'Memoir,' p. x.) There have been several subsequent editions. The best edition is that of Dr. Jamieson, 4to, Edinburgh, 1820. From some passages in Wyntown's 'Chronicle,' it has been surmised that Barbour also composed a genealogical history of the kings of Scotland; but no part of this is known to be extant.

BARCLAY, or BARKLAY, ALEXANDER, was an elegant writer of the 16th century, but whether English or Scotch by birth is disputed. He was educated at Oriel College, Oxford, about 1495, when Thomas Cornish, suffragan bishop of Tyne in the diocese of Bath and Wells, was provost of that house. After finishing his studies there, he went into Holland, and thence into Germany, Italy, and France, where he applied himself assiduously to the languages spoken in those countries, and to the study of their best authors. Upon his return home, he became chaplain to Bishop Cornish, who appointed him one of the priests or prebendaries of the college of St. Mary Ottery, in Devonshire. After the death of his patron he became a monk of the Benedictine monastery of Ely, where he continued till the suppression of the monastery in 1539. Bishop Tanner ('Bibl. Brit. Hib.' p. 71), from one of Bale's manuscripts, says he afterwards became a Franciscan at Canterbury. There seems no doubt that he subsequently temporised with the changes in religion. On February 7th, 1546, we find him instituted to the vicarage of Great Badow in Essex, and on March 30th following to the vicarage of Wokey in Somersetshire. On the 30th April 1552, he was presented by the Dean and Chapter of Canterbury to the rectory of Allhallows, Lombard-street, in London, but did not enjoy that preferment above the

space of six weeks. He died in the June following at Croydon, in Surrey, where he was buried in the church.

Bale ('Script. Illustr.' edit. 1557, cent. ix, p. 66) has treated the memory of Barclay with great indignity. He says, he remained a scandalous adulterer under colour of leading a single life. Pits, on the contrary, assures us that Barclay employed all his study in favour of religion, and in reading and writing the lives of the saints. Both accounts are probably tinged with partiality. That Barclay was one of the refiners of the English language, and left many testimonies behind him of his wit and learning, cannot be denied. Among Barclay's works may be noticed 'The Castle of Labour,' an allegorical poem, translated from the French, the famous 'Ship of Fools of the World,' partly a translation and partly an imitation of the German work of the same title by Sebastian Brandt, 'The Mirror of Good Manners,' the 'Life of St. George the Martyr,' &c.

(Tanner, *Bibl. Brit. Hib.*; Wood, *Athenæ Oxon.*; Herbert, edit of Ames's *Typogr. Antiq.*; Warton, *Hist. Engl. Poetry*; Lysons, *Env. of London.*)

BARCLAY, JOHN, was born at Pont-à-Mousson, in Lorraine, in 1582. He studied at the college of the Jesuits in his native place, and the brethren of the order, observing the dawning of his genius, attempted, according to their usual policy, to secure so promising a disciple. This was opposed by his father, William Barclay, an eminent civilian, noticed in a subsequent article [BARCLAY, WILLIAM], who in consequence, in 1603, returned to England, accompanied by his son. John Barclay is said by Bayle to have written and printed, when 19 years old, notes on the 'Thebais' of Statius. In 1604, when his father was paying court to King James, he presented that king with encomiastic verses, which are printed in the 'Delitium Poetarum Scotorum.' In the same year he dedicated to James I. part of the famous Satyricon generally known by the name of Euphormio, which he bestowed on himself as author. He professed a strong inclination to enter the service of the English king, but their adherence to the Roman Catholic faith was equally against his own and his father's promotion. He went with his father to Angers in 1605, returned for a short time to Britain, visited Paris in 1606, where he married Louise Debonnaire, and afterwards settled in London. He dedicated the second part of his satire to the Earl of Salisbury, with an encomium in which few have concurred. What will now however, perhaps, be considered the most interesting part of this curious work, is the fourth book, which in 1614 he published under the title 'Icon Animarum,' and dedicated to Louis XIII. It commences with remarks on the pursuits and character of man at the different ages of his life, and contains a series of sketches of the inhabitants of the various known countries of the world. He writes in a clear lively style, and is full of matter. In the 'Icon,' he dwells on the fertility of the soil of England, and on the maritime character of Britain, and the power the country is capable of exercising at sea. In the meantime, in 1606, Barclay published an account of the Gunpowder Plot—'Series Patefacti divinitus Paricidii,' &c. In 1610 he edited his father's work 'De Potestate Pape,' and in 1612 he defended the opinions of the work and the memory of his father against the attacks of Cardinal Bellarmine and his followers. Of this work, called 'Pietas, sive publicæ pro Regibus ac Principibus, et Privatæ pro Gulielmo Barclaio Parente Vindictæ,' he subsequently spoke with regret, as exposing him to the displeasure of his own church. In 1615 he passed through France and settled at Rome, where Bayle says he enjoyed the patronage of Paul V. He there, in 1617, published 'Parænesis ad Sectarios,' a book more likely to be acceptable to the Holy See than his others. In 1621 was published the first edition of the work by which his name has been best known, 'Argônica.' This is a romance full of incident and description, both the matter and style of which have received the commendations of many of the greatest scholars and poets. It is generally published with a key to the real names supposed to be represented in fictitious characters; but 'Argônica' appears to be entirely a romance, with only occasional allusion to historical events. Its popularity was of long duration. An edition published at Nürnberg in 1776 is the eighteenth. The admiration of Cowper, Coleridge, and D'Israeli have made the name familiar to modern English readers. In 1628 an English translation appeared, with the title 'John Barclay, his Argônica, translated out of Latine into English: the prose vpon his Maiesties command by Sir Robert Le Grys, Knight, and the verses by Thomas May, Esq.' Another translation appeared in 1636, and a third in 1772, with the title 'The Phoenix, or the History of Polyarchus and Argônica,' said to be by Clara Reeve, the authoress of the 'Old English Baron.' It has been repeatedly translated into French, and Italian and Spanish copies occur in catalogues. The author's latter days appear to have been strangely occupied. He cultivated, with the hope of great gain, bulbous-rooted plants, which from their being said to have no perfume and to be valuable only for the beauty of their colours may be presumed to have been tulips; but his treasures were stolen, and his golden dream was dissipated. Barclay died at Rome, on the 12th of August 1621, before he had completed his 40th year.

BARCLAY, JOHN, a Presbyterian clergyman, and founder of the small sect called Bereans, whose peculiar standard of faith is contained in the 11th verse of the 17th chapter of the Acts of the Apostles,

where it is said of the Jews of Berea, "That they received the word with all readiness of mind, and searched the Scriptures daily, whether those things were so." He was born at Muthill in Perthshire, in 1734, and studied at the University of St. Andrews, where he took the degree of A.M. While attending the course of divinity taught at that university, he became conspicuous as a supporter of Dr. Archibald Campbell, a promulgator of doctrines which his enemies charged with savouring of Socinianism. In 1759 he was licensed as a probationer by the Presbytery of Auchterarder, and was for some time assistant to Mr. Jobson, minister of the parish of Errol in Perthshire; but after some acrimonious discussion, arising apparently from Barclay's inculcating his own peculiar views from the pulpit, that connection was broken. In 1763 he became assistant of the minister of Fettercairn in Forfarshire. Here he became the popular preacher and religious leader of the district, and attracted crowds of auditors from the neighbouring parishes. In 1766 he published a paraphrase of the Book of Psalms, with 'A Dissertation on the best means of interpreting that portion of Scripture.' Some tenets supposed to lurk in this production brought upon him the censure of his presbytery. He subsequently published pamphlets calculated to fan the flame he had created against himself. On the death of the clergyman to whom he was assistant, in 1772, the presbytery not only defeated his attempt to be appointed successor, but refused him the necessary testimonials for accepting a benefice elsewhere, and he then left the Church of Scotland, and became the leader of the sect called Bereans, of which a few congregations still exist. He preached for some time in Edinburgh, and subsequently in London and Bristol. In London he kept open a debating society, where he supported his doctrines against all impugners. He died on the 29th of July 1798. He published several works in which he expounded his peculiar doctrines. Barclay was a man of ardent and restless temper and strong dialectic powers.

BARCLAY, ROBERT, a distinguished writer of the Society of Friends, was born December 23, 1648, at Gordonstown, in the shire of Moray, and not in Edinburgh, as stated by William Penn. His father, Colonel David Barclay, of Ury, was the lineal representative of a family which traced its ancestry to Theobald de Berkely, a gentleman of Norman extraction. The grandfather of Robert Barclay having become impoverished by his extravagances, was obliged to sell estates which had been in the family for upwards of 500 years. Upon these reverses, David, who was the eldest of several sons, went into the army, and served as a volunteer under Gustavus Adolphus, king of Sweden. Having attained the rank of major, he remained abroad till the civil wars broke out in his own country, when he returned home, and became Colonel of a Royalist regiment of horse. On the accession of Cromwell's party to power, he retired from his military employments, married, and purchased a house at Ury, near Aberdeen, which became the seat of the family.

David Barclay had three sons. Robert, the eldest, after receiving the rudiments of his education in his native country, was sent to Paris to pursue his studies under the direction of his uncle, who was rector of the Scots College in that capital. "Being ambitious of knowledge, and having a certain felicity of understanding," to use his own expressions, his proficiency was so considerable as to obtain him the notice and commendation of the professors. At the same time, his deportment and character so endeared him to his uncle, that he offered to make him his heir, and to settle a large estate immediately upon him, if he would remain in France. When he found however that his father was opposed to his continuance in a country where he had been won over to the Roman Catholic faith, no temptation could shake his resolution to return home, and he declined the offer which his uncle had made. When he left Paris he was in his 15th year.

While the son was deserting Calvinism for Popery, the father's opinions were undergoing an equally remarkable change. During a short imprisonment, from which he was liberated without anything being laid to his charge, he was converted to the views of the Society of Friends, a sect which had then existed only ten years.

After an interval of a few years Robert followed the example of his father, and in the year 1667 avowed himself a Quaker. This change of opinion gave a decided bias to his future studies. He learned the Greek and Hebrew languages, in addition to the Latin and French, in which he had made great proficiency in France. To his other acquirements he added an acquaintance with the writings of the fathers, and with ecclesiastical history. He soon found profitable use for his knowledge and abilities in defence of his new associates. The Friends, at their origin, did not adopt any peculiar marks; they only dressed like all the strictly religious people of that day, and abstained from all extravagances; they however adhered closely to this plainness, when other people cast it aside, after the restoration of Charles II., under the stigma of puritanism. But the vicinity of Aberdeen was not more free than other parts of Britain from that spirit which affected to discover, under this garb and plainness of manners, a deep-rooted aversion to religion and civil government. The meetings of the society were prohibited, and those who attended them were taken before magistrates, and committed to prison. From such intolerance even the family respectability of the Barclays did not preserve them. They bore their share in the sufferings of those times.

Robert Barclay no sooner saw how much of this ill-will arose from the misapprehensions of the public concerning the principles of the

Quakers, than he set himself to correct them. A book having been written by a Scotch clergyman, embodying the principal charges which had been brought against the doctrines and views of the Quakers, he endeavoured to vindicate them, in a treatise published at Aberdeen in the year 1670, under the title of 'Truth cleared of Calumnies.' A reply being made to this publication, in which all the offensive statements were repeated, Barclay put forth an able and learned rejoinder, entitled 'William Mitchell Unmasked.' In 1670 he married Christian Mollison, a lady whose character is highly spoken of. In 1672 he took the extraordinary resolution of walking through the streets of Aberdeen clothed in sackcloth and ashes, to which he states that he was enforced by "the command of the Lord," that the inhabitants of Aberdeen might be warned and exhorted to immediate repentance.

Barclay believed, as the Society of Friends now do, that divine revelation is not incompatible with right reason, yet he believed, as the Friends also now do, that the faculty of reason alone, unassisted by divine illumination, is unable to comprehend or receive the sublime truths relative to that redemption and salvation which came by Jesus Christ. To show that the tenets held by the society were capable of a rational vindication, Barclay employed all the powers of his intellect, and produced a succession of works, designed and calculated to accomplish this object. The first was an exposition of the doctrines and principles of the Quakers, bearing the following title, 'A Catechism and Confession of Faith, approved of and agreed unto by the General Assembly of the Patriarchs, Prophets, and Apostles, Christ himself chief Speaker in and among them:' in which the answers are all given in the language of the Bible. This was followed by a more scholastic work, called 'Theses Theologicæ,' comprising, in fifteen propositions, the doctrines maintained by the Quakers; and as it met with a favourable reception, he made these propositions the heads of a more elaborate treatise, brought out two years later, under the title of 'An Apology for the true Christian Divinity as the same is held forth and practised by the people called, in scorn, Quakers.' Both these performances were originally printed in Latin, and afterwards translated by the author and published in English. In style and execution they have been deservedly admired. The effect produced by them in altering the tone of public opinion was not immediately visible; but it was proved that this proscribed sect professed a system of theology that was capable of being defended by strong if not unanswerable arguments. Some portions of it became the subject of controversial discussion, the assumption of inward light being supposed by many to set aside the superior authority of Scripture, and the denial of the perpetuity of baptism and the Lord's Supper occasioning a suspicion of infidelity. On this supposed tendency of the system it was acrimoniously attacked by John Brown, in a work to which he gave the title of 'Quakerism the Pathway to Paganism,' now little known and less read.

The propositions in the 'Apology' being enunciated and maintained with logical acuteness, were much canvassed in various seats of learning. In the Netherlands they met with an antagonist in Nicholas Arnold, a professor in the University of Franeker, who published his objections, to which Barclay replied: and in the same year they gave rise to an oral discussion between some students in the University of Aberdeen, on the one side, and the author, assisted by his friend George Keith, on the other. No part of the 'Apology' was controverted by so many opponents as that in which the necessity of an inward and immediate revelation was insisted upon. It was the only portion of the work which could be considered original. The other doctrines contained in it had all been maintained by abler defenders; their arrangement in the Quaker system of theology being the only point in which they differed from the Arminian scheme. None of the numerous publications in which this leading tenet of this new faith was attempted to be disproved, called forth a reply from the writer; but having been requested by Adrian Paets, an ambassador from the court of the Netherlands, with whom he had some conversation on the principles of the Friends, to re-consider the strength of some objections which he had advanced against them, Barclay addressed him in Latin on the subject, while he was in the prison at Aberdeen, reviewed his former arguments, and declared himself more convinced of their truth than he had ever been. The translation of this letter into English was his last literary labour.

The discipline, or church government, of the Society of Friends was as much defamed as their religious opinions. It could not be denied, that in their forms of worship, of marriage, and of burial, there was a wide departure from the customary ceremonial; and it was generally understood that the society carried its interference to a great extent in the private concerns of those who belonged to its communion. These regulations were vindicated by Barclay in a work wherein he contrasts the internal government of the Quakers with the anarchy of the Ranters, and the hierarchy of the Romanists, justifying the discipline of his sect, and defending its members "from those who accuse them of confusion and disorder, and from such as charge them with tyranny and imposition." The publication of this treatise engaged its author in a long altercation with some persons of his own persuasion, who took offence at various parts of it, as tending to violate the rights of private judgment and to restrain the operations of the Spirit. Their opposition, being discountenanced by the society, soon passed away, and the work itself rose into such favour among

the sect, that its title was changed, at one of its yearly meetings, to 'A Treatise on Christian Discipline,' and it became the standard authority on all matters to which it relates.

The importance attached by Robert Barclay to the internal order of the body, and his desire to preach the gospel (which was indeed his strong motive), induced him to accompany William Penn and George Fox to Rotterdam and Amsterdam, for the purpose of consulting the Friends in the Netherlands on some important regulations connected with their system of church government. For the promotion of this and other objects connected with the prosperity of the society, he frequently went to London to attend its annual meetings. His character and connections gave him influence in quarters where the presence of such a man might be supposed to be least welcome. He was known at court, where he was well received, and treated with marked respect by Charles II.

In 1679 Barclay obtained a charter from Charles II. for erecting his lands at Ury into a free barony, with civil and criminal jurisdiction for him and his heirs, which was afterwards ratified by act of parliament; and this privilege was enjoyed by the family until the tenure of all such grants was extinguished in Scotland in the reign of George II. During this year he was again employed in writing in defence of his 'Apology,' and his treatise on 'Discipline'—his two chief works. He also wrote two tracts to prove that all war was indefensible—one of which was addressed to the ambassadors of the several princes of Europe then assembled at Nimwegen; to each of whom he forwarded his tract, accompanied with a copy of his principal work, 'An Apology for the True Christian Divinity.'

In 1682 he was appointed governor of the province of East Jersey, in North America, by the proprietors, among whom was his particular friend the Earl of Perth; but he only availed himself of the power with which he was invested, of sending a deputy. His two brothers afterwards went to settle there, the youngest of whom died on the passage. The few latter years of Robert Barclay's life were spent in the quiet of his family. He was in London for the last time in the memorable year of 1688, and as usual paid a visit to James II. Being with the king near a window, James looked out, and observed that the wind was fair for the Prince of Orange to come over. Barclay replied, "It was hard that no expedient could be found to satisfy the people." The king declared he would do anything becoming a gentleman, except parting with "liberty of conscience, which he never would while he lived."

Barclay died October 3, 1690, in the forty-second year of his age, leaving three sons and four daughters, all of whom were living fifty years after his death. The last of them, Mr. David Barclay, a mercer in Cheapside, is said to have entertained three successive monarchs, George I., II., III., when they visited the city on Lord Mayor's day.

The intellectual superiority of Barclay places him at the head of the writers of his sect. His works contain the only systematic view of their opinions and principles. In his moral character he was free from reproach. In all the relations of life, and in his intercourse with the world, he was conspicuous for the exercise of those virtues which are the best test of right principles, and the most unequivocal proof of their practical influence.

(*Works of Robert Barclay*, 3 vols. 8vo; *Short Account of the Life and Writings of Robert Barclay*; *Jaffray, Diary*, by John Barclay, above referred to.)

BARCLAY, WILLIAM, a civilian, father of the author of 'Argénis,' was born in Aberdeenshire in 1546. In early life he attached himself to the court of Mary Queen of Scots, but the misfortunes of that princess closing the path to preferment, in 1573 he emigrated to France. With many other Scotchmen of the period, he studied civil law under Cujacius at Bourges. In 1578 he became professor of law in the then recently-erected university of Pont-à-Mousson, of which his uncle Edmund Hay was the first rector. In 1600 he published a work in favour of despotic principles, 'De Regno et Regali Potestate, adversus Buchananum, Brutum, Boucherium, et reliquos Monarchomachos, Libri Sex.' Having quarrelled with the Jeuita, whom he charged with a design to attach his distinguished son to their order, he resigned his chair in 1603, and proceeded to England. He appears to have expected to find favour with King James. His defence of despotic power suited one of the leading opinions of this king. A denial of the temporal authority of the pope harmonised with another. On this subject Barclay wrote a book against Bellarmine, posthumously published by his son in 1609, with the title 'De Potestate Papæ, an et quatenus in Reges et Principes secularis Jus et Imperium habeat,' which was subsequently translated into English. It appears however that Barclay's adherence to the Roman Catholic faith interfered with his receiving any promotion directly from James. In 1605 he was appointed Dean and Professor of Civil Law at Angers, where in the same year he published in 8vo a commentary in the titles of the Pandectæ 'De Rebus Creditis' and 'De Jure-jurando,' dedicated to King James. In the same year he died at Angers.

BARCO'CHEBAS (Shimeon Bar Cochba), the Son of the Star, was the title of a false Messiah, who applied to himself the prophecy of Balaam, "There shall come a star out of Jacob, and a sceptre shall rise out of Israel," &c. After the pretensions of Bar Cochba were refuted by the event, he was called Ben Coziba, the Son of Lying. Trajan persecuted both the Jews and the Christians. His animosity

towards the Jews was probably increased during his expedition against the Persians, A.D. 107; at least we see that he became more zealous in his persecution about A.D. 108. The oppression experienced by the Jews stimulated them to rebellious commotions, and they put to death many thousands of Greeks in Cyprus, Cyrene, and other places, when Trajan removed the legions from these provinces at the commencement of his second expedition against the Parthians, about 115 and 116. It seems that the journey of Rabbi Aquiba, or Akiba, to Mesopotamia was connected with the insurrectionary commotions among the Jews. Aquiba preached the approach of the kingdom of the Messiah, whom he considered to have appeared in the person of Bar Cochba, and in the same year a rebellion broke out in Mesopotamia. Lucius Quietus, having subdued the rebels, was appointed by Trajan governor of Palestine. Many rabbies were executed under the government of Quietus in the north of Palestine, especially in Chalcia. After the death of Trajan in 118, the Emperor Hadrian deprived the ambitious Quietus of his office, and appointed J. Annius Rufus governor in his stead. This man (whom the Talmudists erroneously call Turnus Rufus, and whom some rabbies style emperor) adopted very harsh measures against the Jews, who consequently began secretly to collect arms. Aquiba, who had declared himself in favour of Bar Cochba, was with many other rabbies cast into prison. Soon after the return of Hadrian from his second journey to the east, about 130, the rebellion broke out. Shimeon Bar Cochba gained influence partly by a reputation for miraculous powers, and partly by his intrepidity. His followers, the number of whom increased rapidly, fortified the summits of various hills and mountains, concealed arms in caves, commenced a guerilla warfare against the Romans, and cruelly persecuted the Christians who refused to join them. Bar Cochba took Jerusalem about 132 without difficulty, as the garrison had probably left the town to attack the rebels. He issued coins, having on one side his own name and on the other 'Freedom of Jerusalem.' In the British Museum is a coin ascribed by some to Simon the Maccabee, corresponding to the description given by Tychsen and others of a coin of Bar Cochba. One side of this coin represents a portion of four columns, in the midst of which is a lyre; a serpentine stroke below is said to represent the brook of Kidron, and a star seems to allude to Numbers xxiv. 17. The other side has a vessel of manna and a leaf. Münster concluded, from a similar coin, that Bar Cochba had commenced the rebuilding of the temple; but Nicephorus Callist. ('Hist. Eccl.,' iii. c. 24) and Cedrenus ('Script. Byz.,' xii. p. 249) say only that the Jews intended to rebuild the temple. Rabbi Abraham Ben Dior and other Jewish writers state, but no credit is due to the statement, that after the death of Bar Cochba his son Turnus succeeded to the throne, and was himself succeeded by his own son Romulus.

The taking of Jerusalem so animated the courage of the friends of liberty, that Rufus was no longer able to resist them. The rebels occupied 50 fortified places, and 985 villages.

On this the Emperor Hadrian ordered his most able commander, Julius Severus, to leave his post in Britain, and repair to Palestine; but the time which elapsed during his journey was favourable to the rebels. After his arrival, Julius Severus prudently avoided battles, but took a number of fortified places before he marched against Jerusalem, which he took and destroyed after sustaining great losses. The Jews, after the capture of the city, concentrated their forces in the mountain-fortress of Bethar, which was probably the same as Betharim, in the neighbourhood of Bethron, on the north-west side of Jerusalem. While Julius Severus was gradually reconquering the country, Bar Cochba still played the king in Bethar for three years, and, on the unfounded suspicion of treason, executed the learned Eleazar of Modain, who having prayed for the welfare of the fortress, was slandered by a Cuthite (that is a Samaritan), as if he intended to betray Bethar to Hadrian. According to Talmudical statements, Bethar was taken in 135, by the Romans on the 9th day of the month of Ab, the anniversary of the burning of the temple under Titus. It has been stated that on this occasion 580,000 Jews perished; but this must be greatly exaggerated. Bar Cochba fell in the combat, and his head was brought into the Roman camp. Aquiba, and many rabbies, who were considered authors of the rebellion, were put to a cruel death. [AQUIBA.]

Craow, pp. 32, 35; *Seder Haddoroth*, p. 43; *Tsemach David*, to the year of the Jewish era 3880, and other Jewish chronographers, who refer to the respective passages of the Talmuds of Babylon and Jerusalem; *Tractatus Talmudicus Babyl. Gittin*, fol. 57, apud Joh. a Lent, *de Judoorum Pseudo-Mess.*)

BARETTI, JOSEPH, was born at Turin on March 22, 1716. His father intended him for the profession of the law, but young Baretti feeling a dislike to it, left his father's house at the age of sixteen, and went to Guastalla, where he had an uncle, who placed him as a clerk in a commercial house. He applied his leisure hours to literature; and after a few years he left the counting-house, and went to Milan and Venice, where he became acquainted with Gasparo Gozzi, Passeroni, Parini, and other literary men of that age. At Venice he was employed by a bookseller to translate Corneille's plays into Italian. On his return to Turin, in 1747, he wrote a pamphlet against a professor of that university, of the name of Bartoli; but the pamphlet

was suppressed by the regent of the university, and Baretti being reprimanded, determined upon leaving Italy. He had early applied to the study of the English language, and in 1751 he came to London, where he employed himself as a teacher of Italian. In 1757 he published the 'Italian Library,' which was an account of the lives and works of the most valuable authors of Italy, with a short history of the Italian language: this work is valuable as a catalogue. Having become known, he was appointed secretary for the foreign correspondence to the Royal Academy of painting, sculpture, and architecture. In 1760 he travelled through Portugal, Spain, and the south of France, to Italy; and published an account of his journey in his 'Lettere Famigliari,' in 2 vols., 1762. He afterwards recast his work into English, and published it with considerable additions, under the title of 'A Journey from London to Genoa,' 4 vols. 12mo, Dublin, 1770.

Baretti spent several years after his return to Italy between Turin, Milan, and Venice; in which last city he began a critical journal, called 'Frusta Litteraria,' the Literary Scourge, which attracted much attention in Italy. But he conducted his journal in a tone of bitterness, became involved in personal quarrels with several writers of note, and consequently thought it prudent to leave Venice. He took up his abode at Ancona, where, in 1765, he went on publishing his journal, affixing to it the false locality of Trento. Some time afterwards he discontinued it, and returned to England.

In England he wrote 'An Account of the Manners and Customs of Italy, with Observations on the Mistakes of Travellers with regard to that Country,' 2 vols. 8vo, London, 1769. His book is curious, inasmuch as it gives a pretty fair account by an Italian of the manners and habits of his country long before the change that has taken place in consequence of the political vicissitudes of the last century. He also wrote a dissertation in French 'Sur Shakspeare et M. de Voltaire,' in which he refuted many errors which Voltaire had made in speaking of Shakspeare, and exposed his flippancy in judging of the language and literature of foreign nations, such as the English and the Italian, with which he was very superficially acquainted, and into the spirit of which he could not enter. Baretti published an 'Italian Grammar,' and an 'Italian and English Dictionary,' in two vols. 4to, which superseded the former one of Altieri; it has since gone through several editions, and is still much in use. He also compiled a 'Spanish and English Dictionary,' fol., London, 1778.

One evening as Baretti was going to the Academy he found himself unexpectedly involved in a street brawl. Being attacked by several men, he drew his penknife and wounded one of the assailants, who soon after died. He was tried on the capital charge, made his own defence, and was acquitted by the jury. On the trial, Dr. Johnson, with whom for many years he was on terms of intimate friendship, Mr. Burke, and Garrick, gave favourable evidence as to his character.

In 1782 Baretti obtained an increase of his salary as secretary to the Royal Academy, which, added to the profits derived from his literary labours, enabled him to live in decent comfort till May 5, 1789, when he died in London, in his seventy-fifth year.

BARGAGLI, SCIPIO'NE, was born at Siena, in Tuscany, of a patrician family, about the middle of the 16th century. He became distinguished as an elegant writer, and was a member of the academy of the Intronati of Siena, as well as of the Venetian academy which was instituted at Venice in 1593. Bargagli's principal works are, 1. 'I Trattenimenti,' 4to, Firenze, 1581, and Venice, 1587, which by some is called Bargagli's novels. The work is a series of tales, but it begins with a powerful description of the horrors which the people of Siena had to encounter in 1554-55, while besieged by the united forces of Charles V. and of Cosmo, grand duke of Florence, previous to the final extinction of their republic. It is a faithful historical account, and is calculated to excite the most intense interest. 2. 'Dell' Imprese,' 4to, Venice, 1594. This is a work of considerable erudition concerning the origin and symbolic language of devices and mottoes which were assumed in the ages of chivalry, and is considered as one of the best on the subject. The third work of Bargagli is 'Il Turamino ovvero del Parlare e dello Scriver Sanese,' 4to, Siena, 1602, a dialogue on the various dialects of Tuscany, and especially on that of Siena, explaining the principal differences of spelling and pronunciation between that and the Florentine dialect, as well as the difference in certain words used by each to signify the same objects. Bargagli wrote other minor works both in prose and verse. He died October 1612.

His brother GIROLAMO, who was a professor of law, and afterwards a counsellor of some note in his native city, was likewise an author. He wrote a book called 'Dialogo dei Giuochi che nelle Vegghie Sanesi si usano di fare,' 8vo, Venice, 1575, which is an explanation of the numerous social games which used to be and are still occasionally played in Italy. This book has been by some erroneously attributed to Scipione Bargagli.

(Mazzuchelli, *Scrittori d'Italia*.)

BARHAM, REV. RICHARD HARRIS, was born December 6, 1788, at Canterbury, where his family had resided for many generations. He was an only son, and his father, who died in 1795, left him a small estate. In 1802 his right arm was severely shattered by the upsetting of the Dover mail, in which he was travelling to St. Paul's School, London. His life was despaired of for some time, but he ultimately recovered, and regained the use of his arm. From St. Paul's

School he removed to Brasenose College, Oxford, where, during a short but severe illness, he first entertained the thought of entering into the church, though he had previously to this intended to become a lawyer, and did afterwards become for a short time a pupil to a conveyancer. Having passed his examination for holy orders, he was admitted to the curacy of Ashford in Kent, whence he removed to Westwell, a few miles distant. Mr. Barham married in 1814, and shortly afterwards was presented by the Archbishop of Canterbury to the rectory of Snargate, and he obtained at the same time the curacy of Wareham, the former in Romney Marsh, Kent, a district much frequented by smugglers, and the latter on the verge of it. The breaking of one leg and the spraining of the other by the overturning of a gig, gave him occasion to employ himself in the composition of a novel entitled 'Baldwin,' which was published without attracting any notice. Soon afterwards he became a candidate for a vacant minor canonry in St. Paul's Cathedral, and though his friends thought he had no chance of success, he was duly elected in 1821. He thenceforth devoted much of the time not required by his professional duties to contributions in prose and verse to the periodical publications of the day. He wrote 'My Cousin Nicholas' in 'Blackwood's Magazine,' and about one-third of the articles in Gorton's 'Biographical Dictionary' were written by him. 'My Cousin Nicholas' has since been published in a separate form in 3 vols. 8vo.

In 1824 Mr. Barham received the appointment of a priest in ordinary of the Chapel Royal, and shortly afterwards was presented to the rectory of the united parishes of St. Mary Magdalene and St. Gregory by St. Paul, London.

Till the year 1837, when the first number of Bentley's 'Miscellany' appeared, Mr. Barham had been an anonymous and comparatively unknown writer; but the 'Ingoldsby Legends,' a series of humorous tales in verse, which appeared in rapid succession in that work, brought him so much reputation that his pseudo name of Ingoldsby no longer concealed him, and he became generally known as the author. In 1842 he was appointed divinity reader in St. Paul's Cathedral, and he was permitted to change his living for the more valuable rectory of St. Augustine and St. Faith, London.

On the 28th of October 1844, when the Queen visited the city to open the new Royal Exchange, Mr. Barham, who was a witness of the procession, caught a severe cold, from which he never recovered. He died June 17, 1845.

Mr. Barham was personally acquainted with Theodore Hook, the Rev. Sydney Smith, and several other of the distinguished wits of his day, and was, like them, a frequent diner-out, a sayer of good things, and a teller of droll stories; but he never neglected his more serious duties, and was much respected by those who knew him.

The 'Ingoldsby Legends' have been published in 3 vols. post 8vo. 'A Memoir of the Rev. Richard Harris Barham,' by his son the Rev. R. H. D. Barham, precedes the Third Series.

BARKER, BENJAMIN, a landscape painter of Bath, and the brother of the more distinguished Thomas Barker, noticed in another article. [BARKER, THOMAS.] His works are little known beyond the circle of his acquaintances. He was however a painter of very great ability, though his works exhibit many defects of execution. His subjects were chiefly taken from near Wick Rocks, Claverton, Midford, Weston, and Hampton Cliffs, and are remarkable for their fidelity, and for the fine delicate feelings with which the characteristic aspect of each has been selected. He published a set of 48 views, engraved in aquatinta by Theodore Fielding. He died in March 1833, aged 62, at Totness in Devonshire. (*Art Union*, February 1843.)

BARKER, EDMUND HENRY, was born in December 1788, at his father's vicarage of Hollym in Yorkshire. He entered in 1807 as a student of Trinity College, Cambridge, but did not take any degree. Upon leaving the university he became amanuensis to Dr. Parr, in whose house, at Hatton, he resided in that character for several years. He then married, and settled at Thetford in Norfolk. The last few years of his life were marked by painful reverses of fortune. They were spent chiefly in London, where he died, after a short illness, on the 21st of March, 1839.

Mr. Barker's writings in classical philology and criticism were numerous. He was a constant and leading contributor to Mr. Valpy's 'Classical Journal,' almost from its commencement till its close in 1829; and he furnished many papers also to other periodical publications. He edited, with English notes, for the use of schools, portions of several of the classics, both Greek and Latin. He also published a volume in which he believed himself to have disproved Sir Philip Francis's authorship of the 'Letters of Junius;' and he was the compiler or editor of the curious but undigested mass of literary anecdotes and criticisms, devoted to the memory of his friend Dr. Parr, and entitled 'Parriana,' 2 vols., 8vo, 1828.

But Mr. Barker's name has been best known through his contributions to Greek lexicography. The latest work of this kind in which he engaged was the Greek and English Lexicon published in 1831, in which he was the coadjutor of Professor Dunbar of Edinburgh. But an undertaking at once more laborious and more unlucky was Mr. Valpy's spirited reprint of Henry Stephens's 'Thesaurus Græcæ Linguae,' London, 1816-23, 10 vols., fol. Although the editorship of this work was described as vested in more than one person, it was understood universally that the duties involved in the editorship

were really performed by Mr. Barker almost without any assistance. In 1819, after the publication of a few parts, the work was most severely criticised in the 44th number of the 'Quarterly Review.' Mr. Barker himself maintained that the criticism was prompted by resentment, and he defended himself against his supposed assailant in an eccentric and desultory work called 'Aristarchus Anti-Blomfieldianus.'

Mr. Barker's merit as an editor of classical works was that of the collector, not that of the philosopher, or even the critic; but he earned faithfully, and deserves to obtain without reserve, such praise as may be challenged by unwearied and disinterested labour. No man worked harder than Mr. Barker; no man worked with a more single-minded desire for disseminating that which he believed to be valuable knowledge.

BARKER, ROBERT, born at Kells, in the county of Meath, Ireland, was the inventor and patentee of panoramas. He practised originally as a portrait painter in Dublin and in Edinburgh. The first picture of the kind which he painted was a view of Edinburgh, exhibited in Edinburgh in 1788, and in London in 1789, but with indifferent success. His second panorama was a view of London from the Albion Mills, and it was exhibited, with complete success, in Castle-street, Leicester-square, and afterwards in Germany. He built, and opened in 1793, with a panorama of Spithead, the present (Burford's) panorama exhibition-rooms in Leicester-square, which after his death were for many years continued by his son, Henry Aston Barker, who fully equalled his father in the same description of painting. Mr. Robert Barker was assisted in many of his panoramas by his son, and by R. R. Reinagle, R.A., from whose sketches most of his foreign views were painted, as Rome, the Bay of Naples, Florence, Paris, Gibraltar, and the Bay of Algeiras. Nelson's battles of Aboukir and Trafalgar were also among his most popular panoramas. He died in London, in April 1806.

BARKER, THOMAS, was born near Pontypool, Monmouthshire, in 1769. His father was by profession a barrister, but being a man of desultory and expensive habits, he failed to obtain practice, and, having wasted his property, he took to painting portraits of horses, &c. Thomas Barker early imbibed a passion for art; and some of his drawings so much pleased a Mr. Spackman, a wealthy coach-builder at Bath, where the family then resided, that he took the youth under his protection and kept him for several years in his house, affording him at the same time the means and opportunity of pursuing his artistic studies. When young Barker had arrived at the age of 21, his generous patron sent him to Rome to complete his studies, furnishing him with ample funds to maintain himself while there in something like luxury.

Mr. Barker established himself as an artist in Bath. He painted chiefly landscapes and rustic figures; but he occasionally essayed, though with less success, a more ambitious class of subjects. He speedily obtained popularity and patronage in Bath, and indeed throughout the western and midland counties. He only occasionally sent pictures to the London exhibitions, but his name was well known in the metropolitan art-circles. Perhaps no contemporary painter resident in the provinces (Bird excepted) gained so wide a measure of celebrity. One of his pictures—the Woodman—formed one of the most popular engravings of the day; and the Woodman's well-known figure was reproduced in ruder prints, upon jugs and plates, and nearly every variety of earthenware, upon snuff- and tobacco-boxes, pocket-handkerchiefs, and almost every kind of article upon which a design could be painted or printed. Others of his designs were also very extensively employed by manufacturers. As a painter, Mr. Barker displayed in his own peculiar walk great originality, a vigorous though somewhat rude style, considerable powers of colouring, and, above all, the art of rendering his intention plainly perceptible to the general spectator, and of impressing the sentiment strongly upon all. His walk of art was not the highest, but his homely story was unaffectedly and forcibly told, and seldom failed to carry its simple lesson along with it.

Mr. Barker always found ample and liberal patronage; and, having amassed a fair amount of wealth, he erected for himself a handsome mansion at Sion Hill, Bath, filling its apartments with a choice collection of sculpture, pictures, engravings, and other productions of taste and elegance. But the decoration which he specially prized was a large fresco, 30 feet long by 12 feet high, which he painted upon the wall of one of the rooms: it represents the Inroad of the Turks upon Scio, in April 1822, and is a most elaborate composition. His friends and admirers describe it as the noblest of his productions; but neither the character of his mind nor his training as an artist qualified him for a painter of history. Mr. Barker died December 11, 1847, in the 79th year of his age.

(*Art Journal*, 1848.)

BARLAAM. This person would be of very little consequence, but for the fact that he is nearly the last of those who wrote in Greek on mathematics, and that his work is a curious illustration of the arithmetic which preceded the introduction of algebra and the Indian notation. Bernard of Seminara in Calabria was born about the end of the 13th century. He took the vows as a member of the order of St. Basil at an early age, and the name of Barlaam at the same time. He travelled to Greece to acquire the language, and resided for some

time at the court of the emperor Andronicus, at Constantinople. He died probably about 1348.

The mathematical work of Barlaam consists entirely of arithmetic and arithmetical geometry, then called 'logistic.' It was written in Greek, in six books. The first book is on the addition and subtraction of fractions; the second on their multiplication and division; the third on the multiplication and division of sexagesimals; the fourth on operations with surfaces and lines by means of numbers; the fifth on ratios; the sixth on numerical data. Delambre has reviewed the third book ('Hist. d'Astron. Anc.', v. i. p. 320). It altogether gives us but a poor idea of the science of the age, and justifies Delambre's remark, that Barlaam must have had more leisure than ingenuity.

Barlaam is said to have written a work on right-angled triangles; and there is in the catalogue of De Thou's library the title of a work of his as follows:—'Arithmetica Demonstratio eorum quæ Euclides Libro II. in Lineis demonstravit.' (No date or place.) He also wrote in Latin some controversial works.

BARLÆUS, CASPAR VAN BAERLE, was born at Antwerp, February 12, 1584. His father, who was the town registrar of Antwerp, left it when it was taken by the Spaniards, and settled in Holland. Caspar studied theology at Leyden, and afterwards took orders. In 1612 he was made sub-regent of the College of Theology at Leyden; and in 1617 professor of logic in that university. Having taken the part of the Arminians against the Gomarists, he was dismissed from his situation in 1619; and he then applied to the study of medicine, in which he received his doctor's degree at Caen in Normandy. In 1631 he was made professor of philosophy and eloquence in the newly-established University of Amsterdam, where his lectures were greatly applauded. He died at Amsterdam, January 14, 1648. He wrote a number of works, chiefly in Latin: among others, panegyric orations in praise of the great men of his time, Gustavus, Richelieu, Van Tromp, &c.; several poems, 2 vols. 8vo, Amsterdam, 1645; an interesting history of Brazil, under the administration of Maurice, count of Nassau, with the following title: 'Rerum per Octennium in Brasilia et alibi nuper gestarum sub Prefectura J. Mauritii Nassovici Comitiss, Historia,' fol. Amsterdam, 1647. Among his Latin poems is one called 'Britannia Triumphans,' written on the accession of Charles I. to the throne. His 'Epistols' were published after his death, two vols. 8vo, Amsterdam, 1667. Of his controversial writings we may mention the 'Antiputeanus,' 4to, 1633; and the 'Lettres de Viquefort, avec les Réponses de Barlæus,' in Latin and French. According to the then prevailing fashion among the learned, he latinised his name, Baërle, into Barlæus.

BARLOW, FRANCIS, a native of Lincolnshire, in which county he was born about 1626. He received his artistic instruction from a portrait-painter, but his own inclination was for landscapes, birds, fishes, and animals, in which he excelled. As a colourist he was indifferent; on which account many of his works appear much better in engravings than as pictures. John Overton published twelve prints by Hollar, after Barlow, representing various sports, of hunting, hawking, and fishing. Barlow himself likewise engraved; he etched some of the plates of his own illustrations to Ogilby's translation of Æsop's 'Fables,' and also part of the plates in the folio book of poems entitled 'Theophila,' published for Edward Benlow in 1652. There is also a book of birds by Barlow, engraved by W. Faithorn: 'Diversæ Avium Species studiosissimè ad vitam delineatæ per Fran. Barlow, ingeniosissimum Anglum Pictorem. Guil. Faithorn, excudit, 1658.'

Barlow was employed by several noblemen and gentlemen to paint ceilings, with hawking subjects, or other scenes of birds on the wing. He painted also a few portraits, among them a half-length of General Monk, first duke of Albemarle. Though he was much employed, and had a considerable sum of money left him by a friend, he died poor in 1702.

(Walpole, *Anecdotes of Painting*; Heineken, *Dictionnaire des Artistes*, &c.)

BARLOW, JOEL, an American author and diplomatist, was born at Reading, Connecticut, about 1755. He was a boy at school when his father died. In 1774 he entered as a student at Yale College, Newhaven, where he displayed such a taste for poetry and talent of verification as introduced him to the particular notice of Dr. Dwight. Having gone through the usual course of study, Barlow in 1778 took the degree of Bachelor of Arts, and at first applied himself to the study of the law. Four of his brothers were in the revolutionary army, and he had himself been present at several skirmishes, and in one of the severest conflicts that happened during the war. These circumstances inclined him to listen to the suggestion of some influential friends, who advised him to qualify himself for the office of a chaplain in the American army. Accordingly, he applied with diligence to theological studies for about six weeks, at the end of which he was licensed to preach as a congregational minister, and immediately after repaired to the army. Barlow remained in this situation until the end of the war. In 1781 he married Miss Baldwin of Newhaven. During the progress of the war he had occasionally occupied himself in the composition of patriotic songs and addresses, and had also planned and nearly completed his poem on the discovery and prospects of America.

When Great Britain acknowledged the independence of the United States, and the American forces were disbanded in 1783, Barlow

declined the duties of a parochial minister, and reverted to his original profession of the law. With this view he proceeded to Hartford, and there settled. But his habits of mind were not favourable to his success at the bar, and he undertook the conduct of a weekly newspaper. He also employed himself in preparing for the press the poem to which we have alluded, 'The Vision of Columbus,' which was published by subscription in 1787. It was republished in London a few months after its appearance, and has since gone through a second edition in America and one in Paris. The reputation he had by this time acquired procured him a commission from the clergy of Connecticut to adapt Dr. Watts's version of the Psalms to the use of the New England churches, in which his improved version is in use at the present day. In 1788 Barlow gave up his newspaper and law, in order to proceed to Europe as the agent of a company for the sale of certain extensive tracts of land on the Ohio River. During his stay in London he formed a close connection with the large body of men, who at that time held republican and revolutionary principles, and among whom such a man was well calculated to acquire influence. In 1791 and 1792 he produced some political works which increased his reputation with his own party; these were—'Advice to the Privileged Orders;' 'The Conspiracy of Kings,' a poem of about four hundred lines, relating to the coalition of the continental sovereigns against France; 'A letter to the National Convention;' and 'Royal Recollections;' all indicating rather more zeal than ability or discretion.

Having been sent to France, with one Frost, to present to the National Convention an address from the association calling itself the 'Constitutional Society,' in London; the fact was noticed in parliament in such a manner that Barlow did not consider it prudent to return to England. In France, soon after his arrival, the rights of a citizen were conferred upon him. He then accompanied the deputation of the national convention which was sent to Chambéry to organise the newly-acquired territory of Savoy as a department of the republic. His stay there during the winter was marked by the publication of a 'A letter to the People of Piedmont on the Advantages of the Revolution, and the necessity of adopting its Principles in Italy.' He also wrote at Chambéry a mock-heroic poem in three cantos, entitled 'Hasty Pudding,' which is described by some of his own countrymen as the happiest and most popular of his productions.

In the following three years of his residence at Paris, he made a translation of Volney's 'Ruins.' He next embarked in some commercial speculations, which ultimately enabled him to realise a considerable fortune, and to live in Paris with some degree of splendour. He was in that city in 1795, when he received from his own country the appointment of consul-general at Algiers, but he soon returned to Paris, where he resumed his commercial operations, and continued to reside till 1805, when, after an absence of seventeen years, he returned to his native country.

After his return, Barlow appears to have chiefly employed himself in altering his 'Vision of Columbus' into the form in which, in the year 1808, it finally appeared under the title of 'The Columbiad.' 'The Columbiad' has not however attained the popularity and circulation which the original 'Vision of Columbus' enjoyed; and in most respects it is immeasurably inferior to the poem with which it may best be compared—'The Lusiad' of Camoëns. After the publication of this his great work, Barlow employed himself in collecting materials for 'A History of the United States,' a work which he had long contemplated. In the midst of these pursuits, the President Madison, who held him in high esteem, appointed him minister-plenipotentiary to the court of France, and, in the year 1811, Barlow once more embarked for Europe.

He landed at Cherbourg in September, 1812, and immediately proceeded to Paris, where, in the absence of Napoleon I., he was received by the minister of foreign affairs. His mission was to negotiate a treaty of commerce with France, and to obtain indemnity for former spoliations. For this purpose it became necessary to have a personal conference with the emperor, who had then commenced the Russian campaign of 1812. He therefore set out for Wilna; but fell ill before his arrival there, and died on the 26th of December 1812, at Zarnawica, a small village in the neighbourhood of Cracow, in the fifty-eighth year of his age.

(*Biographie Nouvelle des Contemporains, &c.*)

* BARLOW, PETER, an eminent mathematician, was born in 1776 at Norwich, in which city his father for many years held an engagement with a manufacturing firm. Having had no other educational advantages than those afforded by a respectable day school, he is mainly indebted for his subsequent acquirements and position to his own unassisted exertions.

In 1806 Mr. Barlow was appointed one of the mathematical masters in the Royal Military Academy at Woolwich, became subsequently professor, and filled the chair until 1847, when he retired after more than forty years' services. The works which he published shortly after his appointment exhibit proofs of his profound mathematical knowledge. In 1811 appeared his 'Elementary Investigation of the Theory of Numbers, with its Application to the Indeterminate and Diophantine Analysis,' &c.; and in 1814 his 'New Mathematical Tables,' and 'A New Mathematical and Philosophical Dictionary.' In 1817 the 'Essay on the Strength and Stress of Timbers,' &c., was published, which in

later editions embodies experiments on the strength of iron and its application to railways.

A paper by Mr. Barlow, 'On the Effects Produced in the Rates of Chronometers by the proximity of Masses of Iron,' was printed in the 'Philosophical Transactions' for 1821, and followed by others, during fifteen years, on various magnetic phenomena, on fluid lenses for telescopes, on important questions in optics and navigation, all of which have contributed materially to the advancement of science. In 1823 he was elected a Fellow of the Royal Society, and sat in the council at different periods from 1829 to 1839. In 1825 the society marked their sense of his scientific and philosophical merits by the award of their Copley Medal, for, to quote the official phrase, "various communications on the subjects of magnetism."

Mr. Barlow's name will long be remembered for his method of compensating compass-errors in ships, whereby the difficulty and danger of navigation are in a great measure overcome. In his 'Essay on Magnetic Attractions,' published in 1820, he was the first to reduce these apparently anomalous phenomena to strictly mathematical principles, and to show their application. For this valuable work the then existing Board of Longitude gave him the Parliamentary reward for useful discoveries in navigation.

In 1836, King William IV. appointed Mr. Barlow a member of the Royal Commission for fixing on the most advisable lines of railway in Ireland; and in 1839 he was chosen one of the commissioners for deciding on the preference to be given to any one line, among the several railways then projected for connecting the metropolis with the manufacturing districts of England and Scotland. Again in 1845, he was named by the royal authority on the Commission to inquire into and determine the long-vexed question of the broad and narrow gauge. Reports on these subjects have been printed.

Mr. Barlow was elected a Fellow of the Astronomical Society in 1829. He is a member of the Academies of St. Petersburg and Boston (U.S.), and a Corresponding Member of the Academies of Brussels and Paris.

BARNABAS, ST., though not of the number of the twelve chosen by our Saviour, is nevertheless styled an apostle by the primitive fathers, as well as by St. Luke, to whom that portion of the Scriptures called the Acts of the Apostles is ascribed. (Acts xiv. 14.) Barnabas's divine vocation, and the share he took in the apostolic labours, obtained him this title. From St. Luke also we learn (Acts iv. 36) that he was by descent a Levite of the country of Cyprus, then largely inhabited by Jews, and that his first name was Joses, or Joseph. He received that of Barnabas (meaning 'the son of consolation') from the apostles, as appropriate to his character for pre-eminence in works of charity. The 'Laudatio S. Barnabæ Apostoli,' by Alexander, a monk of Cyprus, says that his parents brought him in his youth to Jerusalem, to Gamaliel, by whom he was instructed in the law and prophets with St. Paul. (See also 'Baronii Annal.' ad ann. xxxiv.) There is at least probability in this, as he was the person to whom St. Paul applied, shortly after his conversion, to introduce him to the society of the apostles. The first mention of Barnabas in Scripture is in one of the passages already quoted, where (Acts iv. 34) it is related that the primitive converts at Jerusalem lived in common, and that as many as were owners of lands or houses sold them, and brought the price, and laid it at the apostles' feet; on which occasion, with the exception of Ananias (in the next chapter), no one is particularly mentioned but Barnabas. Barnabas afterwards preached the gospel in different parts, together with St. Paul (Acts xv. 36); but upon a dissension about the person who was to accompany them in a journey which they proposed to the churches of Asia, which they had planted, they separated from each other: Barnabas went with Mark (the person about whom the dispute originated) to Cyprus; and Paul went with Silas to Cilicia. What became of Barnabas after this, or whither he went, is uncertain. The manner of his death is also uncertain. His festival is kept by the Church of England on June 11.

There is still extant an epistle ascribed to St. Barnabas consisting of two parts. The first is an exhortation and argument to constancy in the belief and profession of the Christian doctrine; particularly the simplicity of it, without the rites of the Jewish law. The second part contains moral instructions. This epistle was written in Greek; but Lardner says that the first four chapters, or sections, and a part of the fifth, are wanting in the Greek copies. It is however entire in an ancient version. Archbishop Wake has printed a translation of it. In this epistle there is no express mention of any book of the New Testament; but there is a text or two of the New Testament in it, with a mark of quotation prefixed; and the words of several other texts are applied. From one passage it seems evident that the Temple of Jerusalem was destroyed at the time of writing it. Lardner thinks that this epistle is probably by Barnabas, and certainly ancient, and written about A.D. 71 or 72.

BARNARD, SIR JOHN, a merchant of considerable eminence in the city of London, was born at Reading in Berkshire in 1685. His parents being of the sect called Quakers, he was educated in a school at Wandsworth in Surrey, under a teacher of that persuasion. In his nineteenth year however he conformed to the Church of England, and was baptised at Fulham by Dr. Compton, then bishop of London. Previously to the event just mentioned, and when only fifteen years of age, young Barnard was taken into the counting-house of his father, a wine-merchant in London. While engaged in this business the wine-

merchants of London petitioned the House of Lords on the subject of a bill injuriously affecting their interests, and chose Mr. Barnard to argue their case, which he did with so much ability and success, that the bill was withdrawn. At this time Mr. Barnard was thirty-six years of age.

A dissolution of parliament occurring in 1722, he was put in nomination as one of the candidates for the city. Out of six candidates Mr. Barnard was second on the poll, and he continued to represent the city in parliament during nearly forty years. From his first election he took an active part in the debates, and owing to his knowledge upon commercial and financial questions, proved a very useful member of parliament; he generally voted with the party opposed to the administration of Sir Robert Walpole.

In 1732 Mr. Barnard, who four years before had been elected an alderman of London, received the honour of knighthood on presenting an address to the king congratulating him on his return from Germany. In 1737 Sir John Barnard served the office of lord mayor of London.

In 1745, during the rebellion in Scotland, public credit received a severe shock, and so much distrust was shown towards the Bank of England, that the most serious consequences to that establishment were apprehended. In this crisis Sir John Barnard came forward and procured signatures from most of the leading merchants of London to an agreement, binding themselves to receive the notes of the Bank of England in payment of all debts and bills, and thus the evil was averted. In 1758 Sir John retired from public life, and on that occasion received a vote of thanks from his fellow-citizens for his long and various services. He lived for six years in retirement, and died at Clapham on the 29th August 1764, in the eightieth year of his age: he was buried at Mortlake. His fellow-citizens had during his life placed a statue of him in the Royal Exchange, which was destroyed in the fire on January 10, 1838.

BARNES, JOSHUA, was born in London on June 10, 1654. He was educated at Christ's Hospital, and went in December 1671 to Emmanuel College, Cambridge. Here he distinguished himself by a minute and grammatical knowledge of Greek, and he was elected Regius Professor of Greek at Cambridge in the year 1695. In 1700 he married Mrs. Mason of Hemingford, a widow lady with a good jointure, a large part of which he devoted to the publication of his Homer in 1710; in 1711 he wrote to Harley three letters, which are preserved in the Harleian Collection (Br. M. 7523), praying for preferment, but in vain. He died in 1712, and his widow erected a monument to his memory at Hemingford. He wrote a considerable number of works, including poems and sermons; but the only ones requiring notice, and these are only known to a few scholars, are the 'History of Edward the Third,' and annotated editions of Euripides, Anacreon, and Homer.

BARNEVELDT, JOHAN VAN OLDEN, was born at Amersfoort, in the province of Utrecht, in 1547, and was descended "from an ancient and noble stock," as he states himself in his 'Apologia.' In 1564 he went to the Hague to prosecute the studies of an advocate. After spending five years in the study of the law, and, according to the fashion of the times, of divinity, between Heidelberg and the Hague, he settled as an advocate in the latter place in 1569. His talents being of the first order, his practice soon became considerable: he was appointed one of the advocates of the court, and in 1576 was chosen counsellor and pensionary of Rotterdam. In 1575 Barneveldt married a lady who did honour to his choice, though he himself declared that he was at the time much more influenced by the amount of her property than her virtues; an avowal which, taken with other parts of his conduct, tends strongly to substantiate the accusation of his enemies, that his character was not free from the taint of avarice.

While the struggle between the Netherlands and Philip II. was at its height, Barneveldt, who was early distinguished for his patriotic ardour and impatience of the yoke of Spain, did not let either his advocate's gown or his habits as a civilian prevent him from occasionally discharging the duties of a soldier. In 1573 he assisted as a volunteer at the memorable siege of Haarlem, and was only prevented by illness from taking part in the still more memorable siege of Leyden in 1575. In 1585 the prospects of the United Provinces were most disheartening. They had just lost their leader, William of Orange, to whose firmness, sagacity, and unconquerable zeal for his country's welfare, they were mainly indebted for their honourable position in the eyes of Europe. William fell by the hand of an assassin on the 10th of July in the preceding year. The Spanish arms, directed by the Prince of Parma, were almost everywhere triumphant, and it appeared hopeless to continue the struggle without the aid of foreign powers. Under these circumstances the States-General opened negotiations with France and England, from whom they had received promises of assistance. Ambassadors were sent by the States to the French and English courts. Henry III. was too much engaged with the war of religious factions which then distracted his own kingdom to aid the insurgents, and accordingly referred them to the good offices of the Queen of England. On the 29th of June, 1585, a deputation, headed by Barneveldt, made a formal offer of the sovereignty of the revolted provinces to Elizabeth on their knees, beseeching her to accept the people of the Netherlands for her subjects. Elizabeth refused the proffered sovereignty, but entered into a treaty, by which she bound herself to aid them with 5000 foot and 1000 horse, advancing at the

same time a considerable sum of money, to be repaid at the end of the war.

Elizabeth intrusted this armament to the command of Dudley, earl of Leicester. Barneveldt saw from the beginning that Leicester was totally unworthy of the important trusts confided to him, and promptly used his influence with the States to limit his real powers. By his advice, and with a view to control Leicester's military authority, Prince Maurice, the son of William of Orange, then but nineteen years of age, was raised to the dignity of Stadtholder, Captain-General, and Admiral of Holland and Zealand; and he contrived that, though Leicester was, according to the treaty of alliance with Elizabeth, a member of the Council of State, he had no share in the proceedings of that more select council, consisting of the chief magistrates, in whom by his advice the government of the Netherlands was actually vested. Barneveldt remonstrated with Leicester, upon the part of the States, for his misgovernment; appealing to their violated privileges, ruined finances, and to the neglected discipline of his army, for proofs of oppression and incapacity. Leicester was indignant at being thus held responsible for his conduct to saucy burghers and traders, and angrily dissolved the Assembly of the States for presuming to meddle with measures beyond their province. The States, by Barneveldt's advice, continued their sittings. The quarrel continued to grow more inveterate, until the States at length solicited Elizabeth to recall Leicester, and obtained their request.

Barneveldt boasts that he alone opposed Leicester's mischievous presumption, and that in consequence he was rewarded by his inveterate hatred. He was at the time the first civil officer of the commonwealth, having been promoted to the office of Advocate-General of Holland and West Friesland on his return from his embassy to England. Barneveldt tells us that he accepted this high office with great reluctance. Affairs were at the time in great confusion; the finances of the provinces were at the lowest ebb; and, as he urged upon the States, his own fortune was unequal to maintain the rank and dignity of his station in a manner calculated to command the respect of foreigners. He was not however long at the head of affairs before order was restored, trade revived, and the monied resources of the state were improved. Having succeeded in restoring order and propriety, he resigned his office in 1592; but the States were unanimous in soliciting him not to abandon a post of difficulty which he alone was competent to fill. They strengthened their appeal to his patriotism by increasing the salary of the office. Barneveldt continued to conduct the affairs of the state till the year before his death with signal ability and integrity.

In 1603 the States-General dispatched an embassy to England, nominally to congratulate James I. on his accession, but in reality to prevent his concluding a treaty of peace with Spain. This embassy was on a scale of unusual splendour, and was composed of Prince Frederick of Nassau, brother of Maurice the Stadtholder, Barneveldt the Grand Pensionary, and Valck and Brederode, two of the first dignitaries of the republic. The conduct of the embassy was trusted to the sagacity and experience of Barneveldt. No ordinary address and perseverance were required to overcome the feelings which James entertained towards men whom he did not hesitate to denounce as rebels. Fortunately for Barneveldt in this embarrassment, the celebrated Duke of Sully, then M. de Rosny, arrived as ambassador from his master, Henry IV. As it was the interest of France that the Netherlands should not be restored to the king of Spain, Barneveldt had not much difficulty in persuading the French ambassador to use his influence at the English court in favour of the revolted provinces. The result of these negotiations was, that James attached his signature to a treaty drawn up by Sully, which bound the kings of France and England to aid the States by a secret advance of money, to be followed up by actual hostilities against the Spanish king if he should resent this clandestine assistance. Barneveldt failed however to persuade either monarch to send an army to aid the brave defenders of Ostend, then in the third year of its memorable siege. (Grotius's celebrated 'Prosopopoeia of Ostend' in his Latin poems.)

The truce of twelve years between Spain and the United Provinces, signed on the 9th of April 1609, which was effected almost entirely through the influence and firmness of Barneveldt, exposed him to unworthy suspicions. He was vehemently opposed by the army and the military authorities, guided by Prince Maurice the Stadtholder. Every artifice of delay and misrepresentation was resorted to with a view to holding up the advocates of the truce with Spain as traitors to the cause of national independence. Though Barneveldt had been the means of extorting from the Spanish court a recognition of the independence of the United Provinces as a preliminary condition to all negotiation, he was denounced as one who had received bribes from that court for the purpose of establishing the Spanish yoke and the Catholic faith; and so strong was the popular delusion, and so fierce the opposition of Prince Maurice, that Barneveldt, at one period of the negotiation, resigned his office of grand pensionary in order to avert the calamities of a civil war. At the solicitation however of the States-General he resumed his office, and, strongly supported by the ambassadors of France and England, overcame all difficulties after a struggle of two years, and the truce of twelve years was concluded.

The great services which William of Orange, the father of Maurice, had rendered to the cause of independence, induced the States-General

to invest him with almost supreme authority. His son, a bold and ambitious prince, of great military capacity, bred up in camps and in habits of command, succeeded to the same authority, but it soon became manifest that, unless the ascendancy of the laws were firmly established, the great struggle in which the nation had been so long engaged against Spain would end in a mere change of masters. Hence the nation was divided into two great opposing parties—the war and the peace party; the contest in fact of the civil power with the military—between Maurice the Stadtholder and Commander-in-Chief, and Barneveldt the Grand Pensionary. Unfortunately for the issue of this struggle, fanaticism, under the name of religion, became an element of the contest. All the wars and intestine broils indeed of the 16th century were more or less mixed up with sectarian controversy. Though the progress of the Reformation led to measures favourable to civil liberty, religious liberty was the growth of institutions and habits of thought which found no favour in the eyes of the leaders of the secession from the Church of Rome, many of whom, both in theory and practice, were far from tolerant. This was particularly the case in those countries (the Netherlands for example) in which the change in religion was effected in opposition to the civil magistrate. Barneveldt had early braved the prejudices of the Calvinistic clergy and the multitude, by his efforts to procure liberty of conscience throughout the provinces, and by his open protection of Arminians, in the controversy between that divine and his antagonist Gomar. Prince Maurice, on the other hand, lent his aid to the Gomarists, knowing that they were the more numerous and powerful party, counting them by their voices in the States-General, though there is every reason to suppose that he was in belief an Arminian.

It is not necessary to particularise the steps by which Maurice of Nassau, after a struggle of ten years, triumphed over Barneveldt and the States, and usurped the sovereign power. The army was ardently devoted to him, and the ignorance of the populace, and the fierce intolerance of the Calvinistic preachers, powerfully ministered to his ambition. As the truce of twelve years was mainly owing to the firmness and sagacity of Barneveldt, he was denounced by Maurice's party as one who had sold himself and country to Spain and popery; and as he had openly espoused the doctrines of Arminius, he was denounced by the Calvinist preachers as leagued with the Catholic monarch in his designs against the Protestant worship. Still, however, the weight of his character, his eloquence, and the undeniable benefits which followed from his administration, enabled him to keep his ground against all the attacks and stratagems of his adversaries. In 1616 Barneveldt's influence was increased by his having obtained from James I. the restoration of the Cautionary Towns, which had been given up to Elizabeth as securities for the money which she had lent the States by the treaty of 1585. The debt due at the time by the United Provinces to England amounted to 8,000,000 florins; but Barneveldt, by adroitly taking advantage of James's necessities and avarice, had the debt cancelled by a prompt payment of about one-third of the amount.

It was about this time that Prince Maurice endeavoured to win the consent of Barneveldt to his assuming the sovereignty of the republic. For this purpose he sent his step-mother, the celebrated Louisa de Coligny, to sound him as to his feelings; but that princess, instead of seducing Barneveldt from his duty to his country, was so convinced by his arguments of the danger of such a measure, that she laboured to divert Maurice from his purpose. Thus baffled and exposed, he sought to remove Barneveldt, the great obstacle to his ambition.

The question upon which the great struggle between Barneveldt and the Stadtholder finally turned was the calling a national synod, to which the point at issue between the Arminians and the Gomarites should be referred. Barneveldt was well aware of the object which those who clamoured for this assembly had in view; he opposed it with all his influence, as a project fraught with danger to internal peace and the interests of true religion; and would probably have succeeded in defeating it altogether, but for the intrigues of Carleton, the English ambassador, acting by orders of James I., who had been grievously offended by Barneveldt affording protection to Vorstius, one of James's literary antagonists. The point at issue between Barneveldt and his opponents was simply whether any other form of religion should be tolerated in the states save that of the Church of Geneva. Barneveldt contended, that as the War of Independence did not originate in religion, but in hostility to the political oppression of Spain, in which even the Catholics were as eager as the Protestant inhabitants, each state should be at liberty to choose its own form of worship. He appealed to the declarations and conduct of William, the late Stadtholder, who, to the last, had openly tolerated all forms of worship, not excluding the Catholic. His opponents, on the other hand, maintained that, by the act of union of the revolted provinces, the Calvinistic religion was declared to be the national religion of the new state. Barneveldt however induced the States of Holland and Utrecht to act upon his views, and moreover to issue a proclamation, in which a veto over the appointment of the clergy was asserted by the civil magistrate. Great disturbances followed this declaration in some of the states: Barneveldt called upon Maurice, as the commander of the military force, to aid the civil authorities in suppressing them; but Maurice encouraged the confusion, and the Arminians were everywhere assaulted and persecuted.

In this embarrassment Barneveldt formed a militia, composed of the citizens, in Arnheim, Leyden, and Utrecht: this body was called by the Dutch name of Waartgelders. Maurice immediately marched his army against the militia, disarmed them, took possession of the Arminian towns, deposed the Arminian magistrates, and openly assumed absolute authority. The States-General, overawed by his boldness, and jealous of the fame and influence of Barneveldt, ratified all his proceedings, and at his bidding took decisive steps towards summoning a national synod, which met at Dort November 13, 1618. Previous to this, Barneveldt and his friends Grotius and Hoogerbeets had been arrested (February 21, 1618) by the States-General, acting under Maurice. This bold step induced the state of Holland, which had at first opposed the Synod, to consent, under the influence of fear and the violent measures of Maurice.

The trial soon followed. "Whatever becomes of the other prisoners," writes Carleton, the English ambassador, who openly avowed that his master approved of Maurice's proceedings, "Barneveldt is sure to lose his head." Such seems also to have been Barneveldt's conviction, all his efforts being directed to save his family from the consequence of this punishment. He expressed no regret at his own fate, except so far as it might implicate his friends; and was particularly concerned for Grotius, then in the prime of life, and, like himself, devoted to his country's welfare. The trial of the prisoners commenced on the 19th of November 1618. It was in vain that Barneveldt protested that the whole proceedings were illegal, and that he triumphantly refuted all the charges urged against him: he was found guilty, among other things, for "having brought the church of God into trouble," and sentenced to death. It was deemed however expedient not to carry the sentence into effect till it had received the sanction of the decision of the Synod, which then held its sittings. The Synod closed its sittings on the 9th of May 1619, with a denunciation of all those who had opposed the Calvinist clergy. On the 14th of May Barneveldt was beheaded on a scaffold erected in the court-yard of the Hague, meeting his fate with that calm courage which attended him throughout life. A letter which he wrote the night before his execution to his wife is still preserved, and is a touching monument of his firmness and affection.

BARNEY, JOSHUA, a commodore in the navy of the United States of America, was born at Baltimore on the 6th of July 1759. Being one of fourteen children, he was taken from school at the early age of ten years, and was first sent for a short time to assist in a retail store in Baltimore, and afterwards to be a clerk in a merchant's office in Alexandria. About a year later, when only eleven years of age, he entered on board a pilot-boat. In his sixteenth year he was appointed second mate of a ship which was dispatched with a cargo of grain from Baltimore to Nice, in the Sardinian territory. The first mate having left the ship, and the captain dying during the voyage, this lad was left to his own energies for the due performance of the remainder of the voyage. This he successfully accomplished, in the face of many difficulties, and brought home the ship to the full satisfaction of its owners.

On his return to America, Barney finding that the disagreements of the provinces with England had come to an open rupture, immediately offered his services to the provincial government, and was appointed master's mate in a sloop of war called the 'Hornet.' In this he so signalled himself by his bravery and good conduct, that, when scarcely seventeen, he obtained the commission of lieutenant in the United States' navy. After this Lieutenant Barney was for some time employed on board small vessels of war, and exhibited great zeal and activity in the performance of his duty. In the course of four years he was twice taken by the English and exchanged, and in 1780, when not yet twenty-one years of age, he had married, and was again in active service on board the United States' ship 'Saratoga.' This vessel captured several British merchant vessels, and Barney being placed as prize-master on board one of these, which was in an almost sinking condition, was again captured by an English ship, and sent as a prisoner to England.

Having escaped from the prison in which he was confined, and having spent some weeks in London, he embarked for Ostend, visited France and Spain, and reached his home in March 1782. He was immediately appointed to command a small ship of war, one of a squadron fitted out for the protection of trade in the Delaware. While thus employed, Barney was attacked by two ships and a brig belonging to the British navy, and by a combination of stratagem and bravery, succeeded in capturing and securing one of the ships. For this gallant action he received the thanks of the legislature of Pennsylvania, accompanied by a gold-hilted sword; and his prize being fitted out and commissioned in the American navy, he received the command.

Commodore Barney was afterwards sent with dispatches to Dr. Franklin at Paris, and returned to America with a British passport, bearing dispatches which announced the signing of preliminary articles of peace between England and America.

At this time the commodore was only twenty-five years of age, and the public having no further occasion for his services, he embarked in commercial speculations connected with the sea, but was unsuccessful. In the course of these pursuits he visited France in 1794, and in the following year received a commission as captain in the French navy.

He afterwards obtained the rank of chef-de-division, and served as commander of the French squadron in the West Indies. On his return to France he resigned his commission, and received the grant of a pension for life, which however he would never touch. Returning home, he again engaged, with no better success than before, in commercial undertakings, and after a time retired to the cultivation of a farm.

When the war between England and America broke out in 1812, Barney immediately fitted out a privateer, in which he made some valuable prizes, and was shortly afterwards appointed by his government to the command of a flotilla, to be employed for the protection of Chesapeake Bay. While engaged in this service, Commodore Barney, finding that a British expedition had landed, and was in full march for Washington, left his flotilla in charge of his lieutenant, and joined the land forces with 400 of his men. The hostile forces met at Bladensburg, and the Americans were obliged to retreat, but owing to a wound which the Commodore had received in the leg, he was taken prisoner by General Ross. Being liberated on his parole, he retired to his farm, where he received the thanks of the State of Georgia and of the city of Washington. Except being afterwards selected to convey dispatches to the American ministers in Europe, Commodore Barney's public life terminated on the field of Bladensburg. The wound he had received on that occasion never thoroughly healed. Afterwards, when on a journey into Kentucky, he experienced a sudden attack of spasms in the wounded limb, and on the following day, the 1st of December 1818, he died at Pittsburg, in the sixtieth year of his age.

BARONIUS, CÆSAR, an eminent ecclesiastical writer, and cardinal presbyter of the Roman Church, was born 31st October 1538, at Sora, an episcopal town of the kingdom of Naples. He received his first education at Veroli, and afterwards studied divinity and law at Naples; but the troubles of that kingdom induced his father to remove him in 1557 to Rome, where he continued those studies under Cæsar Costa, afterwards archbishop of Capua. Here he placed himself under the discipline of St. Philip de Neri, founder of the congregation of the Oratory, by whom, after he was ordained priest, he was attached in 1564 to the congregation of the church of St. John the Baptist in that city. He continued there till 1576, when he was transferred to the church of Santa Maria della Vallicella. In 1593, St. Philip de Neri, having laid down the office of superior of the congregation of the Oratory, appointed Baronius his successor; and Pope Clement VIII. not only approved the choice, but some time after made Baronius his confessor, advanced him to the dignity of cardinal, June 5th, 1596, and finally made him librarian of the apostolic see. Upon the death of Clement VIII., in 1605, Baronius had thirty votes in the conclave for his election as pope, but the Spaniards opposed his election on account of his treatise 'De Monarchia Sicilia,' in which he had argued against the claim of Spain to that kingdom. Baronius's intense application to study weakened his constitution, and he died at Rome, June 30th, 1607, aged sixty-eight years and eight months, and was interred in the church of Santa Maria della Vallicella, on the 13th of July.

Baronius was a man of sincere piety, great probity, learning, and extensive reading, who laboured with success in the service of the church to which he belonged, and in clearing up ecclesiastical antiquity. He undertook his most celebrated work, his 'Annales Ecclesiastici,' when he was thirty years of age, and continued for thirty years collecting and digesting his materials. The first volume of this work, which contains the first century after Christ, was published in 1588; the twelfth and last, which concludes with the year 1198, was printed in 1607, under the pontificate of Paul V. These twelve volumes contain the history of the twelve first ages of the church. Baronius left materials for three more volumes, which were used by Raynaldus (Odoario Rinaldi) in his Continuation of Baronius's Annals.

Mazzuchelli enumerates seventeen different works of Baronius in print and twelve in manuscript. But his fame rests almost wholly on his 'Annales Ecclesiastici,' of which numerous editions have been published: the best is that by Odoario Rinaldi, in 19 vols., fol. Lucca, 1738-46, followed by an 'Index Universalis,' 3 vols. fol. Lucca, 1757-59, and accompanied by 'Annalium Ecclesiasticorum Cæs. Baronii Apparatus,' 1 vol. fol. Lucca, 1740, and by Rinaldi's Continuation ('Annales Ecclesiastici ab anno MCXCVIII. ubi desinit Cardinalis Baronius'), 15 vols. fol. 1747-56. An abridgment of Baronius's first century of his Annals ('Ridotti in Compendio'), by Francesco Panigarola, appeared in 4to, Ven. 1593, and an abridgment of the whole, in Latin, by Hen. Spondanus, at Paris, fol. 1612, and in numerous subsequent editions. An epitome of the Annals, in Arabic, was published at Rome under the auspices of the Propaganda Society, 3 vols. 4to, 1653-71. Two or three more abridgments, in other languages, are noticed by Mazzuchelli.

The great work of Baronius has been severely criticised by Holstenius, Isaac Casaubon, Comber, and others, on account of its alleged errors and mistakes; but these, perhaps, are not more numerous than are to be expected in a work of such great extent. In relation to controversies, he was always a party writer; but his work is one of the most useful and important on the subject, and Baronius is by some styled the father of ecclesiastical history. Besides Rinaldi's, there are two other continuations of Baronius's Annals: one to the year 1572, by Bavovius, 9 vols. fol. 1616-72; the other extending to 1639, 2 vols. fol. Paris, 1639.

BARRAS, PAUL FRANÇOIS JEAN NICOLAS, COUNT DE, a member of the French Directory, and an important actor in some of the principal events of the French revolution, was born June 30, 1755, at Lohempoux in Provence. His family was one of the most ancient among the nobility of Provence. In 1775 he entered the army, and sailed for the Isle of France, but the vessel was wrecked on her passage. Owing partly to the exertions of young Barras, the crew and passengers eventually reached Pondicherry in safety; but this place being shortly after taken by the English, he returned to France. He again returned to India, with Suffren; but soon after left that country with the intention of proceeding to the siege of Gibraltar, but not arriving in time he went to Paris. Here he expressed himself with so much freedom respecting the conduct of the war in India as to expose himself to personal danger, which was only prevented by the exertions of an influential friend. At this period the life of Barras was that of a man of pleasure, and in this career he soon wasted his moderate fortune. The revolution at length commenced, and he immediately became one of its warmest partisans. He was a member of the Jacobins' Club from its commencement, and was engaged in the affair of August 10, 1792, which virtually terminated the existence of the monarchy. Being sent to the National Convention as representative of his native department, he voted unconditionally for the death of Louis XVI. From the Convention he received various public commissions, in one of which he was engaged in the south of France at the time when the English blockaded the town of Toulon. On this place falling into the hands of the republicans, he was one of the five Conventionalists who sat as a commission and carried into effect the frightful orders of the Convention for the proscription and execution of the Toulonese, when more than 400 executions took place. Only he and another member escaped the denunciations which its proceedings excited on the part of more than 300 of the political clubs with which France was at that time covered. On his return to Paris, Robespierre received him with a sneering compliment on his energy. At this time terror reigned in the capital. The Girondists, and even Danton, had perished on the revolutionary scaffold; and Barras was determined not to go to the Convention unarmed, where, by the boldness of his character and other considerations, he was a personage of considerable importance as one among the few opponents of the terrorists. Robespierre, beginning to feel that his power was on the decline, meditated a new proscription, and wished to strengthen himself with the support of Barras, who however refused, and made known to his colleagues the proposition of Robespierre, adding, "He is lost in spite of the Jacobins." Finding it impossible to treat with Barras, Robespierre kept aloof from the committees, but after an absence of two months he made his appearance. The celebrated movement of the 9th Thermidor (July 27, 1794) immediately followed. On that day, Barras and some other deputies presented themselves to the Convention. Tallien denounced Robespierre, whose arrest being decreed, he was sent to prison, from which however he escaped. Henriot, commander of the Parisian Guard, a creature of Robespierre's, marched on the Convention, which, in its imminent peril, named Barras general-in-chief, and charged him with its defence. The fate of the day was soon decided; and Robespierre, with some of his most intimate partisans, was executed. Barras was afterwards charged with the superintendence of the children of Louis XVI., who were confined at the Temple, and his conduct towards them was marked by consideration and kindness. Indeed, after the 9th Thermidor, he displayed great moderation; and he obtained the erasure of many names from the list of proscribed emigrants. He was named successively secretary and president of the National Convention. In his political principles he refrained from committing himself wholly to any of the great contending parties. At the crisis of the 13th Vendémiaire (October 5, 1795), the Convention again named Barras general-in-chief. The success on this occasion was chiefly owing to Bonaparte, to whom Barras, recollecting his services at Toulon, had confided the command of the artillery; and he afterwards obtained for Bonaparte that of the army of Italy. The anarchists being put down by the 13th Vendémiaire, the directoral government was formed, of which Barras was a member. It did not work well; and the coup d'état of the 18th Fructidor (September 4, 1797) was resolved upon as a means of effecting its more complete consolidation. For the third time Barras was invested with dictatorial powers, and success again attended his efforts. General Augereau invested the halls of the legislative councils and arrested the obnoxious members. [AUGEREAU.] Two members of the Directory, Barthelemy and Carnot, about forty members of the Legislative Council of Five Hundred, eleven members of the Council of Elders, and other individuals, were ordered to be transported to the swamps of Guiana, where several of them died. Carnot escaped into Germany. The Council of Five Hundred, now remodelled, proposed to get rid in a similar manner of such of the nobility as still remained in the country, but Barras in this instance successfully opposed their wishes. After the affair of the 30th Prairial (May 18, 1799), the legislative councils resumed their independence, curtailed the dictatorial power of the Directory, and obliged three of the directors to give in their resignation. Barras contrived to remain in office, though he had opposed this movement; but he and Sieyès were united as to the necessity for overthrowing the constitution of the year 3, since a new combination of the executive power seemed

to them the only means of fixing themselves more firmly in the government. General Bonaparte, being apprised of these intrigues by his brother Lucien, left the army in Egypt, and arrived in Paris for the purpose of carrying his own personal projects of ambition into execution. Seconded by Sieyès, he effected the revolution of the 18th Brumaire (November 9, 1799), the immediate result of which was his nomination as First Consul. From this period the power of Barras was annihilated. Finding himself abandoned by everybody, he sent a letter to the President of the Council of Elders, saying "that he returned with satisfaction to the rank of a mere citizen, leaving the destinies of the republic in the hands of the illustrious warrior whom he had been so fortunate as to initiate in the career of glory." He lived in retirement at Grosbois, refusing all the offers made to him by the new government; among others, the embassies of Dresden and of the United States, the command of the army of St. Domingo, and even a medal which Bonaparte had struck. He afterwards removed to Brussels; but this city not agreeing with him, he obtained leave to retire to Marseille, where he lived, as before, under surveillance, attending quietly to agricultural pursuits. In 1813 he was incriminated in a conspiracy, and underwent some interrogations; after which he was exiled to Rome, but remained still under the watchful eyes of the French police. Here he was again accused of being connected with a conspiracy, but the preliminary investigations into its character and ramifications were broken up by the fall of Napoleon. In 1814 he took up his residence at Paris. In 1815, foreseeing new troubles, he withdrew from Paris, but returned on hearing of Napoleon's disembarkation. Afterwards he resided at Chaillot, near Paris. He died in January 1829. Barras was more fond of pleasure than of business, but he was not destitute of talent; inclined to indolence, he could show firmness and activity at times; he was naturally humane and good-natured, generous towards his friends, and prodigal in his expenditure. Notwithstanding his affectation of republicanism, his manners and tastes were those of a nobleman of the old monarchy. He could speak well and to the purpose; and these qualities gave him an ascendancy over his rougher colleagues. He possessed considerable shrewdness and tact, which he employed in securing his own interests; and it is illustrative of his character, that Barras was the only member who, throughout the various changes which the Directory underwent, kept his seat from its installation, at the end of 1795, to its final overthrow by Bonaparte in November 1799.

BARRELIER, JAMES, was born at Paris in 1606. He commenced the study of medicine, but when just about to receive the degree of doctor, he abandoned the medical profession, gave himself up to the study of theology, and in 1635 took the vows of the order of Dominicans. Having studied the fathers of the church, he taught theology, but devoted his leisure hours to the study of botany. In 1646 he was appointed assistant to Father Thomas Tarco, the general of the order of Dominicans, and accompanied him on his visits to the different convents. In this way he traversed the south of France, Spain, and Italy. During these excursions he collected plants and other objects of natural history. He made drawings of the plants, which he caused to be engraved, with a view to their publication. Having had his head-quarters at Rome for twenty-five years, he returned to Paris in 1672, and took up his abode in the convent in the Rue St. Honoré. Here he laboured to perfect his work, till he died of asthma, September 17th, 1673.

His manuscripts and collections Barrelier bequeathed to the library of the convent, but soon after his death all his collections were dispersed, and some were burnt. The copper-plates escaped, and were collected and published by Antoine de Jussieu, who supplied descriptions in the place of those which had been destroyed. This work, to which was prefixed a life of Barrelier, appeared in one volume folio: 'R. P. Barrelieri Plantæ per Galliam, Hispaniam, et Italiam observatæ, iconibus æneis exhibitæ, opus posthumum; accurate Antonio Jussieu, botanices professore, in lucem editum, et ad recentiorum normam digestum, cui accessit ejusdem auctoris specimen de Insectis,' Paris, 1714. It contains 1324 figures engraved upon 334 plates, of which three are of shells, the rest of plants. Some are copied from earlier writers, but the greater part are new, or very rare, so that the volume is still worth referring to. Barrelier composed a work, intended to include descriptions of all the plants then known. He called it 'Hortus Mundi'; but it was never published. He also left 700 figures of fungi, and 300 of shells. A genus of plants belonging to the order of *Acanthaceæ*, was called in honour of him *Barreleria*.

(Haller, *Bibliotheca Botanica*; *Biographie Universelle*.)

BARRET, GEORGE, a landscape painter of great celebrity in his time. He was born at Dublin in 1732, and commenced his career by colouring prints for a printseller of the name of Silcock. His first landscapes were painted from the estate of his patron, Viscount Powerscourt near Dublin. In 1764 he obtained a premium of fifty guineas from the Society of Arts in London; the first premium given by that society for landscape. He was one of the original members of the Royal Academy, founded in 1768, and towards the close of his life he was master painter to Chelsea Hospital, an appointment which he procured through his friend Burke. Barret received large sums for his pictures at a time when Wilson with difficulty earned a bare subsistence. But he was extravagant, and got into various pecuniary difficulties. He died at Paddington in 1784.

BIOG. DIV. VOL. I.

Barret's landscapes are bold and natural in design, but his colouring is somewhat peculiar and heavy. Some of his lake scenes have great excellence; in them he succeeded very well in conveying the impression of vastness, and his sombre colouring has sometimes in these scenes a peculiarly characteristic effect. He also represented the dispersion of the mists in such places very happily. Barret painted occasionally in water-colours, and executed a few etchings.

BARRI, GIRALDUS DE, or SYLVESTER GIRALDUS, more generally known by the name of GIRALDUS CAMBRENSIS, was the fourth son of William de Barri, by Angharath, daughter of Nesta, daughter of Rhys ap Theodor, prince of South Wales, and was born in or about 1146, at the castle of Manorbeer, in Pembrokeshire. Being a younger brother, and intended for the church, he was sent to St. David's, where his uncle, David Fitzgerald, at that time bishop of the see, undertook the care of his education. Giraldus, in the history of his own life, acknowledges that in early youth he was negligent and playful, but his uncle and his masters remonstrated so sharply with him that he became diligent, and soon surpassed his fellow-students. When twenty years of age he was sent to the University of Paris, where he remained for three years, and acquired great fame for his skill in rhetoric and the belles-lettres. On his return to England, about 1172, he entered into holy orders, and obtained soon after the archdeaconry of St. David's and other preferments both in England and Wales. He now devoted his whole mind to promote the interests of the church. Finding the Welsh reluctant to pay tithes he obtained from Richard, archbishop of Canterbury, the appointment of legat in Wales to rectify these and other abuses. He executed this commission with great spirit and success. He likewise attempted to reform the morals of the clergy, and was peculiarly severe against all priests who had wives; these he called concubines, and insisted upon their dismissal. The old archdeacon of Brecknock, who opposed his remonstrances on this account, was at first suspended, and afterwards deprived, a sufficient maintenance only being assigned to him from his former preferment, which was bestowed upon the officious legat.

On the death of David Fitzgerald his uncle, the canons of St. David's met in council, and, after a long debate, elected Giraldus to be his successor; but the archdeacon thinking the election made too hastily, and not according to the usual forms, went on the following morning to the chapter, and, contrary to the advice of his friends, renounced it. His reason was that the necessary application had not been previously made to the king or his justiciary for the royal assent. The chapter however persisted in their choice, which so displeased King Henry II. that he threatened to dispossess them of their lands and revenues. The king summoned a council, and submitted the case to the consideration of Richard, archbishop of Canterbury, and his suffragan bishops, desiring them to recommend a fit person to fill the vacant see. They unanimously recommended Giraldus as a man of learning and spirit, but the king objected; and Peter de Leia, a Cluniac monk of Wenlock in Shropshire, was, in consequence, chosen bishop of St. David's. Giraldus retired to the University of Paris, and prosecuted his studies chiefly in civil and canon law, the professorship of which last, in that university, was offered to him in 1179. He returned home in 1180, and, proceeding to his archdeaconry, found the diocese of St. David's in confusion. Peter de Leia had quarrelled with the canons and inhabitants, and was driven from his see, the administration of which was now committed by the Archbishop of Canterbury to Giraldus. He held it three or four years, when the bishop was restored.

About 1184 Giraldus was made one of the royal chaplains by King Henry II.; and soon after was sent as a pacificator to Wales. In 1185 he was appointed preceptor to Prince John, whom he accompanied to Ireland as secretary and privy-councillor; but when the prince returned after a residence of some months, Giraldus remained to complete and digest the collections he was making for his two works on the topography and conquest of Ireland. Previous to leaving that country the prince offered Giraldus the Irish bishoprics of Fernes and Leighlin, either separately or consolidated, but he refused both, having already resolved to accept no other bishopric than that of St. David's. In 1187 he returned to England, when, having finished his work on the topography of Ireland, he read its three divisions (distinctiones), on three separate days, before public audiences in the University of Oxford. On the first day he entertained all the poor of the town; on the next day the doctors and scholars of fame and reputation; on the third day the scholars of the lower rank, the soldiers and burgesses.

In 1188 Giraldus accompanied Baldwin, archbishop of Canterbury, in a journey [BALDWIN] through the rough and mountainous parts of Wales, in order to preach to the people the necessity of a crusade. The more lasting fruit of this journey was his work entitled 'Itinerarium Cambriæ.' In 1189 he attended King Henry II. in his expedition into France, and remained there till after the king's death, when Richard I. sent him back to preserve the peace of Wales, and even appointed him coadjutor to William Longchamp, bishop of Ely, in the regency of the kingdom. After refusing the bishoprics of Bangor and Llandaff, in hopes to succeed to St. David's, his favourite object, that see became vacant in 1199, when he was unanimously elected to it by the chapter, but he was again disappointed by the opposition of Hubert, archbishop of Canterbury. This involved him in a contest which lasted five years, during which he took three journeys to Rome,

and was at last defeated, the pope passing a definite sentence, and declaring his election null.

Soon after this Giraldus resigned his archdeaconry in favour of Philip, the youngest son of his brother, Philip de Barri; but he retained his other preferments.

Giraldus passed the last seventeen years of his life in study, revising his former literary works and composing others, of which he has himself given a copious index. In the midst of these occupations he received once more an offer of the bishopric of St. David's, and would have met with no opposition from the court; but from the dishonourable terms on which it was proffered, he refused the ecclesiastical dignity which had so long been the object of his earnest wishes. He died at St. David's, in the seventy-fourth year of his age, and was buried in the cathedral church, where his effigy still remains upon an altar tomb beneath an ornamental arch. Giraldus appears to have been an upright and able man. As an ecclesiastic he was zealous, active, and fearless in maintaining the rights and dignities of his church; but he was at the same time honest and disinterested. As a scholar he was learned, and as a collector of historical materials diligent, far beyond the measure of his age. As an historian however he was full of credulity, and as a man, as his works prove, one of the vainest upon record.

Giraldus has himself given us a catalogue of his works, as well as a long history of his actions, both printed by Wharton. Other lists will be found in Fabricius's 'Bibliotheca Med. et Inf. Latinitatis,' edit. Patav. 4to, 1754, tom. iii. p. 62, and in the notes to his life in the 'Biogr. Britannica,' edit. 1778, vol. i. pp. 640, 642, 644. Sir Richard Hoare has given us a full account of such manuscripts of his works as exist in the several libraries in the British Museum, in the Archbishop's Library at Lambeth, at Bene't (Corpus Christi) College, in the public library at Cambridge, and in the Bodleian. Those printed are, 'Itinerarium Cambrie,' 12mo, Lond. 1585, and in Camden's 'Angl. Norm. &c. Script.,' fol. Francof., 1602, pp. 815-878; 'Topographia Hibernicæ,' Camd. ut supr., pp. 692-754; 'Expugnatio Hibernicæ,' ibid., pp. 755-813; 'Descriptio Cambrie,' ibid., pp. 879-892. Several short pieces by Giraldus are printed in the second volume of Wharton's 'Angliæ Sacra.' The 'Gemma Ecclesiastica,' published at Mentz in 1549, without the author's name, under the title of 'Gemma Animæ,' is ascribed to Giraldus. John Stowe's translations from Giraldus's historical works relating to Wales and Ireland are among the Harleian Manuscripts in the Museum, Nos. 544 and 561, in his own handwriting. Sir Richard Colt Hoare, in 1806, published the 'Itinerary of Archbishop Baldwin through Wales,' translated into English, and illustrated with views, annotations, and a life of Giraldus, 2 vols. 4to. To this work the preceding account is much indebted, as well as to the life in the 'Biographia Britannica,' article 'Barry;' to Bale, 'Illustr. Script.;" Wharton, 'Angliæ Sacra,' vol. ii., pp. 457-513; and Fabricius's 'Bibliotheca Med. et Inf. Latinitatis.'

BARRINGTON, THE HONOURABLE DAINES, a learned antiquary, lawyer, and naturalist, was the fourth son of John Shute, first Viscount Barrington, well-known from his connection with the Harburgh lottery (on account of which he was expelled the House of Commons), and the author of the 'Miscellanea Sacra' and various other works. His mother was a daughter of Sir William Daines. Daines Barrington was born in 1727. After having concluded his course of general education at Oxford, he was entered as a student at the Inner Temple, and was called to the bar in Hilary Term, 1749. Though he never acquired any eminence in practice, his family obtained for him early in life several lucrative offices. In 1751 he became Marshal of the Court of Admiralty, and resigned that office on being appointed secretary for the affairs of Greenwich Hospital in 1753. He appears for a short time to have travelled the Oxford circuit, and he was junior counsel for the prosecution on the well-known trial of Miss Blandy, for the murder of her father, in 1752. Shortly after receiving the appointment of secretary for Greenwich Hospital he was elected Recorder of Bristol; and in 1757 was made a puisne Welsh judge. He presided with Lord Kenyon at the great sessions for Deubighshire, in 1783, when the trial of the Dean of St. Asaph for a seditious libel was to have taken place, but was put off on the ground of attempts to prejudice the minds of the jury. In the year 1785, being possessed of an ample income, he gave up his judgeship and all public employments except the place of commissary-general of the stores at Gibraltar, and retired to his chambers in the Inner Temple, of which society he was a bencher. He died in the Temple on the 11th of March 1800.

The most important of Mr. Barrington's numerous writings is a book entitled 'Observations upon the Statutes, chiefly the more ancient from Magna Charta to the 21 Jac. I. c. 27,' which was first published in 1766. Four editions subsequently appeared under the superintendance of the author, in the course of which the work was much enlarged and improved. The design was to introduce a project, which is detailed in an appendix, for repealing obsolete and useless statutes, and reducing acts which relate to the same subject to one uniform and consistent law. The importance of the scheme and the eagerness of its projector may be measured by the slow progress which has been since made towards its realization, notwithstanding numerous earnest efforts by individuals and associated bodies to effect such an essential reform. Mr. Barrington's work is one which fully deserves

the high reputation it has obtained; the illustrations of the statutes noticed are extremely curious, and display not only extensive antiquarian research, but a familiar acquaintance with the civil law and the municipal institutions of Europe; and the whole subject is treated in such a manner as to interest the general reader as well as the professional student. Mr. Barrington devoted much attention to the investigation of the celebrated geographical problem respecting a North-West Passage. He examined several masters of vessels employed in the whale-fishery, and collected on this subject a great mass of historical, traditionary, and conjectural evidence, which he detailed in several papers read by him to the Royal Society; and his representations are said to have led to the fitting out by government of an expedition under the command of Captain Phipps, afterwards Lord Mulgrave, for the purpose of making discoveries in the North Seas. Mr. Barrington published the result of his researches in 1775; and when this subject came again under discussion, in 1818, his tracts were republished with an appendix by Colonel Beaufoy. Mr. Barrington was also the author of several papers in the 'Archæologia' on local antiquities, and of a great variety of essays in the 'Philosophical Transactions,' and other periodical publications, on subjects connected with natural history. Many of these were collected and published by himself in 1781 under the title of 'Miscellanies on various Subjects.' A particular enumeration of all Mr. Barrington's works is given in Nichols's 'Literary Anecdotes of the Eighteenth Century,' vol. iii., p. 3 (note), and in the 'Gentleman's Magazine,' vol. lxx., p. 291.

BARROCCIO, FEDERIGO, an Italian painter, was the son of an eminent sculptor, and born at Urbino in 1528. His first master was Battista Venezano, under whom he studied till his twentieth year, when he went to Rome, where a residence of four years enabled him to make vast improvement in his art. Some works which he executed soon after his return to his native town, particularly his picture of St. Margaret, painted for the Confraternity of the Holy Sacrament, procured him such reputation, that he received an invitation from Pope Pius X. to assist in the embellishments of the Belvedere palace, on which Zuccheri was also engaged. Here he executed the Annunciation in fresco on one of the ceilings, and a picture of the Holy Virgin with the infant Saviour, with Saints, &c. Having finished these commissions he returned to Urbino, and contributed to the cathedral of St. Lorenzo and Perugia an altar-piece of the Taking Down from the Cross. During the pontificate of Gregory XIII. Barroccio again visited Rome, where he painted a picture of the Last Supper for the Chiesa della Minerva; also, for the Chiesa Nuova, the Visitation of the Virgin Mary to Elizabeth, and the Presentation in the Temple. These two last are considered to be his finest performances.

Barroccio's style of colouring and effect was formed on that of Correggio, but presents a frequent fault of imitators in transmitting an exaggeration of some of the master's prominent peculiarities. This was noticeable in his drawing, but far more in his colouring. The defects of Barroccio's style are chiefly chargeable against his smaller performances, and there is a strong example of them in his picture of the Holy Family in the British National Gallery. His large works exhibit a richness of surface which Sir Joshua Reynolds has greatly commended, and did not disdain to imitate. There is in the Vatican a picture by Barroccio, of the size of life, representing a female pilgrim overtaken by a tempest on the top of a mountain, painted with a breadth and simplicity, both in respect to colouring and design, which entitles it to rank among the finest works of art. The large pictures of Barroccio are seldom offered for sale, and consequently fetch very high prices. Barroccio died at Urbino in 1612, aged 84. He sometimes handled the graver, and has left several plates of sacred subjects executed with great spirit and correctness, although somewhat deficient in delicacy and finish.

BARROS, JOAO DE, an eminent Portuguese historian, was born about 1496 of a noble family. He was placed while a boy in the court of King Emmanuel as a page, and was attached to the service of the Infante Dom João, afterwards King John III. Young Barros showed an early disposition for study, and especially for the study of history. The gallant achievements of the Portuguese in the East Indies attracted his attention; and the king himself, happening one day to see some of his early attempts at historical composition, suggested that he might employ himself in narrating the glorious actions of his countrymen. In 1522 Barros was sent as governor to St. George da Mina, on the Guinea coast. Three years after he was recalled to Lisbon, and appointed treasurer to the colonial department, and afterwards agent-general for the colonies. While he held this office he availed himself of the valuable documents to which he had access in order to compose his great work, 'Asia Portuguesa,' or the history of the discoveries and establishments of the Portuguese in the Indian Seas. He divided it into four 'Decadas' of ten books each. The first two Decades, published in 1552-53, contain the discoveries and conquests from 1412 to 1515. The narrative begins with the discovery of Porto Santo and Madeira in 1418-19, and contains the numerous expeditions of the Portuguese to the coasts of Senegal, Guinea, Congo, and to the Cape of Good Hope, which was at last weathered by Vasco da Gama in 1497. Then comes the full tide of Portuguese enterprise along the coasts of Mozambique, Mombaça, and on to the Malabar coast, followed by the astonishing success of Albuquerque, and the establishment of Portuguese supremacy in the Indian seas. Barros's second Decade is entirely

occupied with the history of Albuquerque's achievements till the death of that great commander in 1515. The third Decade, published in 1563, contains the events from 1516 to 1526. Of the fourth Decade, the manuscript was purchased for 500 milreis, from Barros's daughter-in-law in 1591, by King Philip II. of Spain, after his conquest of Portugal. It was published in 1615 at Madrid, with notes and additions, by Q. B. Lavanha. It carries on the history of Portuguese India to the year 1539; but before this, Diego do Couto, historiographer of India to Philip II. and Philip III. had commenced a continuation of Barros's first three Decades, and had published a fourth Decade, which he followed up with a fifth, and so on till the eighth, which comes down to the year 1571. The best edition of Barros's work is that of 1778, from the royal press, Lisbon, 9 vols. 8vo, with the life of Barros by Manoel Severim de Faria, and a copious index. Couto's continuation, as far as the eighth Decade, was published also at the same press in 8 vols. 8vo, 1778-83, with a life of Couto. Barros is considered by the Portuguese as their best historian, both for the matter of his history and the manner of his composition. His style is much admired, and his language is considered as a model of Portuguese prose-writing: the narrative is simple and unpretending. Barros died at his estate of Alitem, near Pombal, 1570. He is spoken of as a man of high honour and moral character, both by his biographer, Manoel de Faria, above mentioned, and by Nicolao Antonio in his 'Bibliotheca Hispana,' vol. i. p. 498. He wrote also some moral dialogues and other minor works.

* BARROT, CAMILLE-HYACINTHE-ODILON, was born at Villeport, in the department of Lozère, on July 19, 1791, and educated at St.-Cyr and the Lycée Napoléon. The son of a politician, he early began to follow his father's course. At nineteen he pleaded before the ordinary tribunals, and at twenty-three, by a dispensation, before the Court of Cassation. Here he distinguished himself by his genius, his boldness, and the liberality of his opinions. In 1819 he defended those Protestants of the south accused of not having decorated their houses at the procession of the host on Corpus Christi day, justifying them on the ground of the freedom of religious worship. The Court of Cassation sustained his argument by its decision.

A more advanced step in political life was when M. Barrot became president of the society 'Aide-toi, le Ciel t'aidera,' to which he endeavoured at first to give a direction slowly and legally progressive. At the banquet however known as the Vendanges de Bourgogne, given to numerous members constituting the opposition in the Chamber of Deputies, he said, in the course of his address, that legal paths were sufficient to lead to a triumph for liberty, but if those paths were forcibly stopped by authority, there would be no resource but in the valour of the citizens, and it would not be wanting. In July 1830, M. Barrot became secretary to the municipal commission, and he is said to have influenced M. de la Fayette to refuse the presidency of the republic. He was one of three commissioners charged to conduct the unseated dynasty to Cherbourg. On his return he was nominated Prefect of the department of the Seine, which office he held for six months, marked by conflicts with M. Guizot, and the seditious tumult at St.-Germain. As parliamentary deputy he was the leader of a party opposed to M. Casimir Périer, combated the establishment of a hereditary peerage, and protested against the use of the word 'subject' when applied to the people, as being insulting and unconstitutional. His opposition was continued to the successive ministers who succeeded Périer, until 1840, when M. Thiers was president of the council. At this time he voted for the fortifying of Paris, but spoke against the regency bill, and reproached the government with feebleness on the question of the right of search, claimed by England, and which then greatly interested the public mind.

But a new revolution, to which M. Barrot and his friends contributed no little, chased the Orleans dynasty from the throne of France. The question of the right of holding public banquets, became the cause of a tumult which ended in the downfall of a monarchy. M. Barrot, for a few hours, was named minister with M. Thiers, and pleaded in vain before the chamber of Deputies for the regency of the Duchess of Orleans. On December 10, 1848, M. Barrot became president of the council and keeper of the seals, and he now, though hitherto so strenuous an advocate of parliamentary power, advised the chambers to dissolve. He also defended the expedition to Rome; presented projects of law against the press; and after the 13th of June 1849, he, the president of the reformist banquet, demanded the dismissal of the National Guard who had met to petition on the occasion of the expedition to Rome.

In September 1849, M. Barrot felt compelled by failing health to relinquish for a time his public employment. Returning as a deputy merely, he has voted in favour of the law for the deportation of political offenders; and advocated a revision of the constitution, which he desired to be less republican. Since December 1851, he has withdrawn from public affairs altogether.

(*Nouvelle Biographie Universelle.*)

BARROW, ISAAC, an eminent English divine, was the eldest son of Thomas Barrow, linendraper to Charles I., and descended of a respectable Suffolk family. His uncle, Isaac Barrow, was fellow of Peterhouse College, Cambridge, from which he was ejected by the Presbyterians about 1644, but after the Restoration he became successively bishop of Man and St. Asaph, and died in 1680. Isaac Barrow,

the nephew, was born in 1630, and received his education first at the Charter-house, and afterwards at Felstead school in Essex. In the first he gave but little promise of excellence, his principal delight being in fighting, and his general habits negligent; so that his father is reported to have wished, that if it pleased God to take any of his children, it might be Isaac. At the second school he formed a good character, and in December 1643, he was entered at Peterhouse College, Cambridge, under his uncle above-mentioned. But by the time (February, 1645) the nephew began his residence at the university the uncle had been ejected, and the nephew accordingly removed to Trinity College. His father, in the meanwhile, had suffered losses for his adherence to the cause of Charles I., and it is said that young Barrow was indebted for his support to the well-known Dr. Hammond. He was scholar of his college in 1647; B.A. in 1648; fellow in 1649; and M.A. in 1652; 'ad eundem' at Oxford, 1653; B.D., 1661; D.D. (by mandate), 1670. These testimonies to his merit (the two last excepted) were the more remarkable, as he was, and always continued, a staunch Royalist.

Barrow had at first intended to practise medicine, and had studied accordingly, but on his accession to a fellowship he began to study theology, as required by the statutes of the college. His desire to investigate ecclesiastical chronology led him to the study of astronomy, and that to the higher branches of mathematics. But he had in the meanwhile closely studied the learned languages, so that on the resignation of the Greek professor he was recommended to that chair. This he did not gain, being suspected of Arminianism; and the disappointment, together with the unfavourable character of public events to his views, induced him to go abroad. He travelled (1655-59) through France and Italy to Smyrna and Constantinople, thence again to Venice, and through Germany and Holland home. After his return he was episcopally ordained, a little before the Restoration, but his claims were neglected by those who were now the dispensers of patronage in the church. In 1660 he was chosen Greek professor at Cambridge, and in 1662 Gresham professor of geometry. This last he resigned in 1664, holding its duties to be incompatible with those of the Lucasian professorship, to which he was appointed by Mr. Lucas at the institution of that chair in 1663. This again he resigned in 1669 in favour of a pupil, a young man whom he considered as of the highest promise, aged 27, and named Isaac Newton: indeed his whole history is one of resignations of profit upon principle. He had previously been offered a good living upon condition of instructing the son of the donor; he rejected the offer as simoniacal. His uncle gave him a small living in Wales, and Dr. Seth Ward, bishop of Salisbury, made him one of the prebendaries of that cathedral. He applied the revenues of both preferments to charitable purposes, and resigned them when Charles II., in 1672, appointed him master of Trinity College. In this capacity he strenuously and successfully exerted himself to form a library, the want of which had been long felt. He likewise remitted to the college several expenses which statute or custom might have compelled them to incur for the maintenance of his office. He died very young, considering his reputation, May 4, 1677, aged about forty-seven, and was buried in Westminster Abbey: he left his manuscripts to Tillotson (afterwards archbishop), and Abraham Hill, his biographer.

Barrow's moral and personal character were of the highest excellence. His energy of mind is sufficiently attested by the extent of his writings—by the successful variety of his studies—by the extraordinary opinion of him formed by his associates, when compared with the degree of interest his writings present to posterity: which is always, in our opinion, proof of a lustre cast upon writings by personal character—and by the erection of Trinity College Library above-mentioned. The quarrelsome disposition of his boyhood subsided into rational and even reasoning courage, under the discipline to which he subjected his mind. Dr. Pope, who was personally intimate with him, thus describes his appearance and habits:—"As to his person he was low of stature, lean, and of a pale complexion, and negligent of his dress to a fault. . . . He was of extraordinary strength, a thin skin, and very sensible of cold; his eyes grey, clear, and somewhat short-sighted; his hair a light-brown, very fine, and curling. He was of a healthy constitution, very fond of tobacco, which he used to call his 'panpharmakon,' or universal medicine, and imagined it helped to compose and regulate his thoughts. If he was guilty of any intemperance, it seemed to be in the love of fruit, being of opinion that, if it kills hundreds in autumn, it preserves thousands. He slept little, generally rising in the winter months before day." Dr. Barrow never married: his fellowship prevented his doing so in earlier life, and on his appointment to the mastership he had the permission rescinded, which was granted in the patent. Mr. Hill says he judged it contrary to the college statutes. His sermons were, even in those days of long sermons, regarded as excessively long. It is said that a sermon on charity, which he delivered before the mayor and aldermen, lasted three hours and a half; and another, from the text, "He that uttereth a slander is a liar," of which he was prevailed upon to preach only the half relating to slander, leaving out that which treated on lies, lasted an hour and a half.

The works which Dr. Barrow published during his life are as follows, in which a few words of the Latin titles only are retained:—1. 'Euclidis Elementa,' Cambridge, 1655, contains all the books of Euclid;

translated, London, 1660. 2. 'Euclidis Data,' Cambridge, 1657, afterwards appended to the preceding. 3. 'Lectiones Opticæ XVIII.,' London, 1669, his celebrated lectures on optics; they were revised and augmented by Newton before their appearance. 4. 'Lectiones Geometricæ XII.,' London, 1670, containing his method of tangents. Afterwards, 1672 and 1674, printed with the optica. 5. Edition of Archimedes, Apollonius, and Theodorus, London, 1675.

The works of Dr. Barrow, published after his death, were—1. 'Lectio, in qua, &c.,' London, 1678. This is Archimedes on the sphere and cylinder, demonstrated by the 'indivisibles' of Cavalieri. 2. 'Mathematicæ Lectiones,' &c. These are Lucasian lectures at Cambridge, and the preface is the preliminary oration delivered by Barrow. 3. 'Works,' &c., edited by Dr. Tillotson, dean of Canterbury, London, 1685, the Preface being Mr. Hill's Life of Barrow: they contain his English theological works, being sermons, expositions, &c.; these have been several times reprinted. 4. 'Opuscula,' containing Latin sermons, speeches, poems, &c. There is a list of manuscripts in the 'Biographia Britannica,' and in Ward's 'Lives of the Gresham Professors.' The 'Lectiones Geometricæ' and 'Mathematicæ' have been translated, the first by Stone, 1735, the second by Kirkby, 1734.

As a mathematician Dr. Barrow has by numerous English writers been declared to be second only to Newton. This is much higher praise than his mathematical writings will justify. Foreign writers have been less partial, and not always just in their estimate of his attainments as a mathematician. Barrow produced in a geometrical form that prelude to the differential calculus which goes by the name of the method of tangents. It was, in point of fact, what was afterwards the fundamental notion of the differentials of Leibnitz, and, in Newton's language, asserted the ultimate equality of the ratio of the differences of two ordinates and abscissæ to that of the ordinate and subtangent. It was so like the previous method of Fermat that Montucla calls it Fermat's method simplified. But if Barrow was not the great mathematician many of his countrymen have been willing to believe, he was very far from the 'obscure' mathematician, which the French Encyclopædists styled him. Barrow was neither an obscure mathematician, nor second only to Newton. He was profoundly versed in geometry, acquainted with all its elegancies as well as all its depth, and had a facility of application. "Nihil quod tetigit non ornavit;" and he carried his methods, as many others have done, into theorems both curious and useful. In reference to the style of his geometrical writings Montucla says—"The merit of these works is a singular brevity (concision) which does not destroy their clearness." Barrow, who in his theological writings is often painfully verbose, is one of the first writers who attempted, by throwing away circumlocutions and introduction of symbols, to distinguish between Euclidean rigour and unnecessary load of language.

In the elucidation of principles Dr. Barrow is not so happy as in his application of them. The 'Mathematicæ Lectiones,' a commentary on the first principles of geometry and arithmetic, is a cloud of words, filled with ancient learning of every kind; and, though sound and logical, difficult to understand. He sometimes complains of his own prolixity, but this is a very poor compensation for so annoying a defect; and we frequently feel the force of the self-accusing terms in which he ends one of his geometrical lectures—"I think I hear you exclaim—*ὄλλαν ἔβην Βάρωσι,*"

The character of Barrow as a theological writer has always stood high among the English divines. His sermons, as Le Clerc observes, are rather treatises and dissertations than harangues; and he wrote and re-wrote them three or four times. They are always cited as exact and comprehensive arguments, the produce of a grasp which could collect, and of a patience which could combine, all that was to be said upon the subject in question. But in addition to this, Barrow was an original thinker of no mean character: learning falls into his work, but a work there would have been if he had had no learning at all. From his desire to set the whole subject before his hearers he is often prolix; the style is frequently redundant; and his sermons require an amount of attention which neither hearer nor reader is often disposed to afford to such productions, and which in truth they would very seldom repay. But the sermons of Barrow are storehouses of thought, and they are often resorted to as storehouses by popular preachers and writers. Nor are they often wanting in passages which, as examples of a somewhat redundant, but grave, powerful, and exhaustive style, it would be difficult to parallel in the whole range of English pulpit literature.

BARROW, SIR JOHN, was born at Dragley-Back, near Ulverstone, North Lancashire, June 19, 1761. Having passed through the Town Bank Grammar School, young Barrow was placed when about fourteen years old as clerk and overlooker in an iron-foundry at Liverpool, but quitted this situation two years afterwards to make a voyage in a whaler to Greenland. Having removed to London, he for a while was employed as mathematical teacher in a school at Greenwich, when he obtained in 1792, through the influence of Sir George Staunton, to whose son he had given lessons in mathematics, the appointment nominally of comptroller of the household to Lord Macartney in his celebrated embassy to China; but really to take charge of the various philosophical instruments carried out as presents to the Emperor of China. Of this journey he published an account some ten years later in a thick quarto volume, entitled 'Travels in China.' In this embassy

Mr. Barrow secured so far the goodwill of Lord Macartney, that his lordship made him his private secretary on being appointed Governor of the Cape of Good Hope in 1797; and when Lord Macartney quitted the Cape in 1798 he left Mr. Barrow in the post of auditor-general of public accounts. During his stay at the Cape Mr. Barrow devoted his leisure hours to the study of the geography and natural history of South Africa, and made several journeys into the interior. On his return to England he published the results of his investigations in a quarto volume entitled 'Travels in Southern Africa.' In 1804 Mr. Barrow was appointed by Lord Melville to the responsible post of second Secretary to the Admiralty, the duties of which he continued to discharge for a period of forty years under thirteen administrations. In this office Mr. Barrow was earnest and indefatigable in the promotion of every project which commended itself to his judgment as calculated to advance the progress of geographical or scientific knowledge. Especially did he labour by every possible means to commend to the various governments under which he served, and to the country, the prosecution of the various voyages to the Arctic regions which have so characterised the naval history of England during the forty years of his connection with the admiralty; and though his services had been fitly commemorated by associating his name with the point of land, Cape Barrow, yet such was the sense entertained of them by those officers who had been engaged in those voyages, that, on his retirement from his secretaryship, they presented him with a costly candelabrum, bearing a suitable inscription on the pedestal.

Mr. Barrow was a man of untiring industry. The leisure hours afforded by his official employment were devoted to literary and scientific pursuits; and his literary labours would in extent have seemed not unworthy of one whose whole time was given to literature. Neither in literature nor science would he be regarded as having attained a high place, but for many years he held a distinguished position in the literary and scientific circles of the metropolis. He was for a long period a member of most of the leading learned societies of London. In 1805 he was elected a fellow of the Royal Society; in 1830 he took a leading part in the foundation of the Geographical Society, of which some years later he was chosen president. In 1835 he was created a baronet.

In the beginning of 1845 Sir John Barrow, then in his eighty-first year, resigned his office at the Admiralty, and retired from public life. He had as early as 1806 received in consideration of his various public services, the grant of a pension of 1000*l.* per annum, to be deducted from the emoluments of any place he might hold under government. He died almost suddenly on the 23rd of November 1848, in the eighty-fourth year of his age. Besides the works mentioned above, Sir John Barrow published a 'Life of Earl Macartney'; 'Life of George Lord Anson'; 'Life of Lord Howe'; 'Life of Drake'; 'Memoirs of Naval Worthies of Queen Elizabeth's Reign'; 'Chronological History of Arctic Voyages'; 'Voyages of Discovery and Research within the Arctic Regions'; 'Sketches of Royal Society and Royal Society Club'; the 'Life of Peter the Great'; and the 'Mutiny of the Bounty' in the 'Family Library'; and his 'Autobiographical Memoir,' written in his eighty-third year. He was also for a long series of years a frequent contributor to the 'Quarterly Review,' having in all furnished 195 articles to that journal, and he wrote some papers for the 'Encyclopædia Britannica,' as well as for one or two other periodical publications.

(An *Autobiographical Memoir of Sir John Barrow*, Bart.; Sir G. T. Staunton, *Memoir of Sir John Barrow*, edited by J. B. [John Barrow, son of the subject of the above article].)

BARRY, JAMES, a distinguished historical painter, was born in Cork, October 11, 1741. In his early youth he frequently accompanied his father, who was a coasting-trader, in several voyages across the channel. His father regarded his son's predilection for literature and the arts with extreme aversion, yet the young Barry made such rapid progress in his scholastic acquirements as to excite the attention of his superiors. His power of application was intense, and he was accustomed to sit up whole nights in succession drawing and transcribing from books. At the age of two-and-twenty Barry went to Dublin, where he exhibited, at the Society of Arts, an historical picture which he had recently executed; the subject was drawn from a tradition relating to the first arrival of St. Patrick in Ireland. This work introduced Barry to Edmund Burke, who discerned in it such evidence of genius as induced him shortly afterwards to take the artist with him to England, where he procured for him in the first instance employment in copying pictures for Athenian Stuart, and gave him all the advantages of his powerful patronage. In the ensuing year he sent him to Rome, where he remained for five years at the joint expense of Edmund Burke and his brother William.

Barry's irritable temper was from the first a constant source of annoyance both to himself and others. Shortly after his arrival in Rome he became involved in a series of disputes with the artists and virtuosi, which being reported to Burke, that gentleman sent him a long and admirable letter of remonstrance and advice; but notwithstanding these disputes Barry proceeded with indefatigable diligence to investigate the principles of the great works which surrounded him, both in ancient and modern art. His mode of study was singular. He drew from the antique by means of a patent delineator, not aiming to make academic drawings, but a sort of diagrams, in which a scale of proportions was established, to which he might at all times refer as

a guide and authority. Accustomed as we are to consider that a competent skill in drawing is only to be obtained by the habitual exercise of the eye and hand, this process seems absurd enough; nevertheless there can be no ground for objecting to the means if the end be obtained; and no one who has seen the picture of the Victors of Olympia can deny that Barry had a thorough knowledge of the human figure, or that he was a correct and scientific draughtsman. The same praise cannot be extended to his colouring; he never seems however to have suspected himself of any deficiency in that quality, and says in answer to some animadversions made on him while at Rome, "I made some studies from Titian, and soon silenced my adversaries."

During his stay at Rome Barry was elected a member of the Clementine Academy at Bologna, on which occasion he painted and presented to that institution his picture of Philoctetes in the Isle of Lemnos, a work which exhibits more genius than taste. In 1770 he returned to England, destitute of all but art, but justly confident in his acquirements, and anxious to distinguish himself. About this time a project had been formed by Sir Joshua Reynolds and other leading artists, for decorating St. Paul's Church with Scriptural paintings; Barry was associated in the undertaking, and he selected the subject of the Jews rejecting Christ. The artists offered their work gratuitously, but this liberal proposition was declined by the cathedral authorities.

During his residence on the continent, Barry's indignation had been greatly excited by opinions prevalent there on the subject of British genius. Winckelmann and Du Bos had proved the English, by what they asserted to be the clearest reasonings, to be utterly incapable of excellence in any of the higher walks of art; and Barry, attaching more importance than was due to such sweeping conclusions, undertook to give them a regular refutation. In 1775 he published an 'Inquiry into the real and imaginary Obstructions to the Acquisition of the Arts in England.' In this work he traces and points out with great perspicuity the real causes, political and others, by which the progress of the arts had been impeded in this country. Shortly afterwards Barry proposed to the Society for the Encouragement of Arts, Manufactures, and Commerce, to paint gratuitously a series of pictures, illustrative of the position, that the happiness of mankind is promoted in proportion to the cultivation of knowledge. His offer was accepted, and the works now decorate the great room of the institution in the Adelphi. The series consists of six pictures, namely, Orpheus reciting his verses to the wild inhabitants of Thrace; a Grecian Harvest-home; the Victors at Olympia; the Triumph of the Thames; the Society distributing their Prizes; and Final Retribution. These apparently dissimilar subjects are brought to bear on the leading idea of the artist with great force and unity; and we are impressed, while regarding them, with the conviction that such a work could neither have been conceived nor executed except by a mind of a very high order. Barry's chief defect was, perhaps, that in his eagerness to grasp at ethical illustration, he was apt to forget those qualities which are essentially requisite to his own art—singleness of impression and simplicity of effect. In the picture of Final Retribution the attention is bewildered amidst the accumulation of characters and costumes; but this deficiency in pictorial unity is to a certain extent atoned for by the general grandeur of conception, by its interesting groups, and diversified circumstances, to which we recur again and again as to a written volume. But the picture on which Barry may rest his most indisputable claim to fame is that of the Victors at Olympia. The picture is not only a fine example of pictorial skill, but embodies whatever impressions have been transmitted to us by poetry or history of those celebrations. Canova is said to have declared when in England, that, had he known of the existence of such a work, he would, without any other motive, have made the voyage to England for the purpose of seeing it. The pictures are doubtless open to severe criticism as works of high art, but the remark made by Dr. Johnson on seeing them, admirably expresses their real value:—"Whatever the hand may have done, the mind has done its part. There is a grasp of mind there which you will find nowhere else"—nowhere else, assuredly, amongst the English historical paintings of the 18th century.

Having completed this work, Barry must have felt conscious that he had at least secured that which had been the chief aim of his life—the reputation of a great painter. This object was obtained by no slight sacrifices; for his task had been pursued, through seven years, amidst all the hardships of poverty and privation. It would be gratifying were we able to add that he received from public admiration or sympathy a reward at all proportioned to his deserts. The result was far different. He was 'permitted' by the society to whom he presented this magnificent gift to exhibit his pictures in the room which they decorate. The receipts of this exhibition scarcely amounted to 500*l.*, to which however the society added a vote of 200*l.*, and this sum comprises nearly the whole produce of his professional career. It can excite little surprise that, under these circumstances, his natural irritability became exasperated, or that the powers of his mind gradually declined: that they did is too strongly attested by his last work—the picture of Pandora receiving the Gifts of the Gods. Barry painted several easel pictures, some of historical and others of poetical subjects; and a few portraits, of which that of Edmund Burke is one of the best. Towards the close of his life he meditated a number of works from

Milton's 'Paradise Lost,' but he did not proceed beyond making the sketches.

Barry's disputes with the Royal Academy were another source of bitterness to him. He had been elected Professor of Painting to that body in 1782, and his altercations with the members were perpetual. In 1797 he reiterated against the Academy the charge made by Sir Joshua Reynolds, that in every measure proposed by him for the general advancement of art he was opposed and outvoted by the machinations of a mercenary cabal. The members felt so annoyed at these allegations that they preferred against Barry a formal body of charges, and in a general assembly expelled him from the Academy.

Shortly after this event, the Earl of Buchan, moved by an impression that Barry had been treated unjustly, as well as by admiration of his talents, and knowing no doubt that he was even then living in solitude and poverty, while age and still deeper distress were in the future, set on foot a subscription in his favour, which amounted to about 1000*l.* With this sum it was proposed to purchase him an annuity; but the close of his career was at hand, and the kind intentions of his friends were rendered unavailing. He died from the effects of a neglected cold fit of pleuritic fever, on the 22nd of February 1806. His remains, after lying in state in the great room of the Society of Arts, in the Adelphi, were interred in St. Paul's cathedral.

Among the literary works of Barry may be mentioned his six lectures delivered at the Royal Academy, and a fragment on Gothic architecture, which Burke pronounced to be "as just as it is ingenious." (Barry's 'Life and Works.')

BARRY'. MARIE JEAN'NE GOMARD DE VAUBENIE'R, COUNTESS DU BARRY, was born at Vaucouleurs, August 19, 1746. Her father, or at least her reputed father, was an exciseman of the name of Vaubénier. After her father's death her mother went to Paris to look for employment, and the daughter was placed in a convent, which she left when about fifteen, and obtained employment at a fashionable milliner's. Soon after she became connected with a disreputable house, where she was seen by Count Jean du Barry, a notorious fashionable rake of his day, who made her his mistress for a short time, and afterwards introduced her to Lebel, valet-de-chambre to Louis XV., by whom she was presented to the king. She was then remarkably handsome, and had an appearance of frankness, and a tone of familiarity, or rather vulgarity, which captivated the licentious monarch. Louis wished her to have a title, in order that she might appear at court, and Guillaume du Barry, Count Jean's brother, consented to lend himself to the wish of the king by marrying her, after which she was introduced to the court at Versailles as Countess du Barry in 1769. The court of France, which from the time of the Merovingian founders of the monarchy had been, with the exception of very few reigns, remarkable for its licentiousness, became during the regency and the subsequent reign of Louis XV. the abode of the most barefaced profligacy. Everything was sold, everything was obtained, through the intrigues of vicious women. The accounts of those scenes which have been transmitted to us in the memoirs of several of the actors, and women too, seem almost incredible. The greatest attention was paid to the Countess du Barry by the most powerful courtiers. The Chancellor Maupeou, Marshal Richelieu, and other courtiers, flattered her, in order to avail themselves of her influence with the king, and it was through her that Maupeou succeeded in dismissing and exiling the parliament in 1771.

When Louis XV. died, in 1774, the Countess du Barry was shut up in a convent near Meaux; but some time after Louis XVI. allowed her to come out, restored to her the residence of Luciennes, which had been built for her by the old king, and allowed her a pension. After this Madame du Barry lived in retirement, and her conduct, as far as is known, appears to have been regular. Among the persons who visited her were several artists, whom she encouraged and assisted in their pursuits. She was almost forgotten when the revolution broke out, but she then showed herself grateful for the treatment she had experienced from Louis XVI. by exhibiting a lively interest for him and his family in their misfortunes; and she even repaired to England, careless of danger, in 1793, in order to sell her jewels, the produce of which she intended for the use of the queen and her children, who were then prisoners in the Temple. On her return from England, she was arrested in July 1793, and in November of the same year she was brought before the revolutionary tribunal on the charge of "being a conspirator, and of having worn mourning in London for the death of the tyrant." She was condemned, and was executed on the 6th of November. The absurdity and injustice of the sentence made many who had before despised her pity her end.

BARRY, MARTIN, an eminent physiologist, was born at Fratton, Hampshire, in March 1802. The strong bent which he early manifested for scientific pursuits, led his parents to give up their scheme of a mercantile life for their son, and he studied in the universities of Edinburgh, Paris, Berlin, and other places in Germany, and in the medical schools of London. He entered warmly into the proceedings of the scientific societies of the Scottish metropolis, and spent most of his holidays in geological and botanical excursions on foot among the lakes and mountains. He took his degree of M.D. at Edinburgh in 1833, and in the following year, after a term of study at Heidelberg, he rambled through Switzerland to Chamouni, where, though past the middle of September, too late in the season, as was thought, for suc-

cess, he went to the summit of Mont Blanc. This was the sixteenth ascent; and Humboldt was so pleased with the narrative of the adventure published by Barry in 1836, that he personally requested him to translate his 'Two Attempts to ascend Chimborazo' from German into English.

Martin Barry has the merit of being one of the few physiologists who devoted their attention to the difficult question of animal development and embryology. He began by making himself well acquainted with the literature of the subject; and in the museums and laboratories of Wagner, Purkinje, Valentin, and Schwann, he brought his knowledge to the test of observation, and acquired that mastery over the microscope which afterwards appeared in the importance and value of his own researches.

Having published in the 'Edinburgh Medical and Surgical Journal' for 1836, a translation of the first part of Valentin's 'Manual of the History of Development,' he commenced his investigations into the development of the mammalian ovum and embryo, at that time, as truly described, "the darkest part of embryological science." The results, communicated to the Royal Society of London, were printed in the 'Philosophical Transactions' under the general title of 'Researches in Embryology.' These, as well as his papers 'On the Corpuscles of the Blood,' 'On the Formation of the Chorion,' 'On Fibre,' &c., will be found in the 'Philosophical Transactions' from 1833 to 1842. The most important—the discovery by which he will be best remembered—"Spermatozoa found *within* the Ovum," appears in the volume for 1843. The Royal Society recognized the value of Barry's researches by awarding him their royal medal in 1839, and electing him a Fellow in the following year.

The 'Researches in Embryology' exhibit proofs of the author's skill in the grouping and selection of his facts, and of the perseverance by which they were demonstrated. He explains the formation of the ovum in the rabbit and dog, and in some of the oviparous vertebrate classes from the bird to the fish. He determined the order of formation of different parts of the ovum, and the nature and mode of its growth from the ovicell; and showed that the so-called 'disc of Von Baer' contained a retinacula, or peculiar species of mechanism, by which, as he supposed, the passage of the ovum into the Fallopian tube was regulated. He described the changes that take place in the ovum while on its passage—changes before unknown; and Barry was the first to throw light on this interesting process of animal development. Not till his paper appeared in 1839, was it known that the segmentation of the yolk which had been observed in Batrachian reptiles, was also true of mammals. It was an important discovery; and not less so that published in 1840—the penetration of the ovum of the rabbit, by spermatozoa, through an aperture in the zona pellucida. This at first was doubted; but he confirmed it by further observation in 1843; and it was eventually corroborated by the observations of Nelson and Newport, accounts of which are also published in the 'Philosophical Transactions;' and Professor Bischoff, who had denied the truth of Barry's conclusions, at last satisfied himself of their accuracy, and accepted them in full.

The views expressed by Barry in his paper 'On Fibre,' are disputed by physiologists. He assumed a spiral structure for muscular fibre and other organic tissues, and brought speculative arguments to bear in favour of his opinions; but other investigations show one and the other to be fallacious. His speculations have however tended to stimulate physiological research. Whatever may have been Barry's feeling for his own favourite ideas, his character as an amiable and benevolent man is beyond question. Ample private circumstances placed him above the need of practising his profession; and he devoted much of his time to the poor, chiefly as house-surgeon to the Royal Maternity Hospital in Edinburgh. From 1849 to 1853 he lived on the Continent to recruit his health and eyesight, both having suffered from long and severe study. At Prague he renewed his examinations of fibre conjointly with Purkinje; with what result may be seen in Muller's 'Archiv.' for 1850. In 1852 he returned to Scotland, suffering much from neuralgia; and having gone to reside at Beccles, in Suffolk, he died there on the 27th of April, 1855.

Barry was a member of the Royal Society of Edinburgh, of the Wernerian and other societies, and the College of Surgeons in that city. Some of his papers and translations are printed in the 'Edinburgh New Philosophical Journal,' and others in the works and periodicals already mentioned.

* BARRY, SIR CHARLES, architect of the new Houses of Parliament, was born at Westminster in 1795. Having passed through the ordinary course of scholastic and professional education, and made the usual architectural tour of the continent, Mr. Barry entered on his career as an architect in London, and soon distinguished himself by the grace and finish of the structures erected by him, especially of those constructed in the Italian style, for which he has always shown a marked predilection. Of these, that which first attracted general attention was the Travellers' Club-House, Pall Mall, erected in 1832, the garden or Carlton-Terrace front of which excited great admiration. This club-house, the first of these Italian palatial edifices erected in London, has been eclipsed by its more magnificent neighbour the Reform Club-House, another of Barry's more important works, erected some fifteen years later; but the Travellers' remains one of the most pleasing buildings of its class in London. One of the first buildings

by which Mr. Barry made his professional attainments evident was the fine gothic church of St. Peter's at Brighton, yet he has since been called upon to erect fewer churches than most among the more eminent of his contemporaries. Of these may be mentioned, a church at Islington and a chapel in Birmingham. Of the scholastic buildings which Sir Charles has designed, the very spacious pile known as King Edward's Grammar School, at Birmingham, a really grand and imposing structure in the Tudor collegiate style; and the New Buildings, in the same style, at University College, Oxford, may be particularly noticed. As belonging to this class of buildings, the Athenæum at Manchester may be named as one of the happiest of his Italian designs. The list of private mansions erected or modified by Sir Charles Barry would be of considerable length. It will be enough for our purpose to name the very elegant villa erected for Earl Tankerville at Walton-on-Thames as one of his earlier, and Bridgewater House, by the Green Park, erected for the Earl of Ellesmere, as one of his latest, and perhaps in nearly all respects the finest as well as the most costly, of his Italian palatial structures. We may also refer, as remarkable in their way, to the extensive and costly extensions, amounting to much more than a rebuilding, of the Duke of Sutherland's seat at Trentham, Staffordshire; the remodelling of the interior of his town mansion, Stafford House; and the enlargement and almost entire reconstruction of the celebrated Clifden House, near Maidenhead, also the property of the Duke of Sutherland. Sir Charles has likewise remodelled some well-known public buildings of some among the more eminent of his predecessors; and that his alterations have really in some instances been improvements, a reference to the Treasury Buildings at Whitehall, originally erected by Sir John Soane, will suffice to show. But important as many of these works are, that by which the architectural rank of Sir Charles Barry will be finally determined is the new Palace of Westminster, the largest, most important, and by far the most costly edifice which has been erected in this country for centuries. The old Houses of Parliament were destroyed by fire October 16, 1834; and the first stone of the present building was laid April 27, 1840. Since that time the work has been prosecuted without intermission; the design continually growing in extent, and the cost increasing in at least an equal proportion. Some years will probably yet elapse before the whole is completed, and until it is completed it cannot as a whole be fairly judged. It has been, as was certain to be the case, exposed to much severe and not a little malevolent criticism; but the opinion appears to be steadily gaining ground that, whatever be its faults, it will worthily sustain in the judgment of posterity the reputation of the architect and of the age.

Sir Charles Barry arrived somewhat slowly at academical honours. He was elected an associate of the Royal Academy in 1840, and an academician in 1841. In 1849 he was elected a fellow of the Royal Society. Sir Charles Barry is also a member of the Institute of Architects, London; of the academies of the Fine Arts at Rome, Berlin, St. Petersburg, Stockholm, and Brussels. He was knighted in 1852.

BART, JEAN, was born at Dunkerque in 1655. His father was a seaman, and was killed in a naval action. Jean, yet a boy, left home and went to Holland, where he served under the celebrated Admiral de Ruyter, and became a thorough seaman. Great courage, activity, and bodily strength, gave him the superiority over most of his comrades. When Louis XIV. declared war against Holland in 1672, Bart refused the offers made to retain him in the Dutch service, and returned to Dunkerque. He there entered on board a privateer, which was very successful in its cruise; and much of the success was attributed to Jean Bart. With the proceeds of his share of the prizes he fitted out a sloop with 2 guns and 36 men, and having met a Dutch man-of-war in the Texel, he boarded her, took her, and brought her into Dunkerque. He next joined several speculators who fitted out a 10-gun ship, and gave him the command of it. Being equally successful in this cruise, he was intrusted with the command of a small squadron of five ships, with which he did great injury to the Dutch, taking both their merchantmen and their armed vessels; and among others a 36-gun frigate, which, after a desperate fight, he carried into Dunkerque. His name now became known at court, and Louis XIV. sent him a gold medal and chain, with the rank of lieutenant in the royal navy. In the war against Spain he made several prizes in the Mediterranean, and when war broke out between France and England, in 1689, he and the Chevalier de Forbin, while commanding two ships of war, were attacked by two English frigates. After a desperate fight, the two French ships were taken and carried into Plymouth. Bart and Forbin escaped soon after by filling the bars of the window of their prison, and obtained a boat, in which they crossed over the Channel to France. On their return the king made them both captains.

In 1690 Bart had the command of a 40-gun ship in the Brest fleet under Admiral de Tourville, and contributed materially to the advantage obtained by the French off Dieppe over the English and Dutch allied squadrons on the 10th July. The following year Bart obtained the command of a squadron of small vessels, which he had recommended to be fitted out at Dunkerque, as better calculated to do injury to the enemy. Passing through the English blockading squadron, he went into the North Sea, where he made numerous prizes; he landed also on the coast of Scotland, where he plundered several villages. After the defeat of the French at the battle of La Hogue, at which he was not present, Bart sailed from Dunkerque with three

frigates, made a descent on the English coast near Newcastle, and plundered and burnt some villages. On his return homewards he fell in with a Dutch fleet of merchantmen under convoy of several men-of-war, and, according to his custom, made straight for the admiral's ship, but was repulsed; he however succeeded in taking several of the merchant-vessels. In 1694 he attacked another Dutch fleet under Rear-Admiral Vries, boarded the admiral's ship, and took her, after having mortally wounded the admiral himself with his own hand. This was one of the most desperate fights in which Bart was ever engaged. By this victory he re-took from the Dutch a fleet of 300 vessels laden with corn from the Baltic, and bound to France, which country was then suffering under a severe dearth. A medal was struck to commemorate this event, and Louis XIV. granted letters of nobility to Bart and his descendants. In 1697 Bart was commissioned to take to Poland the Prince of Conti, one of the candidates for the Polish crown, vacant by the death of John Sobieski; but the Elector of Saxony was proclaimed king of Poland before the Prince of Conti's arrival.

The peace of Ryswick, in September 1697, having put an end to the war, Bart retired to live with his family. He died at Dunkerque April 27, 1702, at the age of fifty-one. He was one of the boldest and most successful seamen that France has ever produced. He was rough in his manners and illiterate, but clever, indefatigable, and frank in his disposition. His eldest son, François, became a vice-admiral, and died in 1755.

(*Life of Jean Bart*, translated from the French [of Andre-Richer], by the Rev. Edward Mangin, M.A., London, 1828; Vandarest, *Histoire de Jean Bart*; *Biographie Universelle* and *Dictionnaire Universel Historique*.)

BARTAS, GUILLAUME DE SALLUSTE, SIEUR DU, the son of a treasurer of France, was born about the year 1544, at Montfort in Armagnac, and brought up to the profession of arms, with which he afterwards united diplomacy, and obtained considerable reputation in both. Being of the reformed religion, he became gentleman of the chamber to Henry IV. during that prince's contest for the throne; served him in several missions at foreign courts, and among others at the English court, where James I. wished to retain him. He was present at the famous battle of Ivry, where he received wounds of which he died four months afterwards. Du Bartas is a striking instance of the perishable nature of reputation founded on literary fashion and a popular subject. In his own time his principal work, giving an account of 'the Week, or Seven Days of the Creation,' and founded probably on the 'Sette Giornate' of Tasso, went through thirty editions in less than six years; was translated into Latin, Italian, Spanish, German, and English; and obtained the applause of his most illustrious contemporaries, including Spenser. Yet his name is now almost proverbial for barbarism of style and bad taste, and his own countrymen treat it with contempt. They accuse him of utter want of judgment; of low, extravagant, and disgusting imagery; and pedantic compounds of words, after the fashion of the ancients. What was pedantry however in this respect with Du Bartas, might have helped, in greater hands, to give fire and elevation to the French language, had the idiom itself permitted it. The same compounding of words, which came to nothing in old French poetry, was so warmly received in England, through the medium of Du Bartas's translator, Sylvester, that, in conjunction with the like daring in Chapman's 'Homer,' and Sir Philip Sydney's 'Arcadia,' it avowedly helped to enrich the poetry of our native country; and to Sylvester are traced some of the most beautiful compound epithets of Milton and Fletcher. Yet so little merit in this result had the genius either of Du Bartas or his translator, that in Sylvester's version, which was once almost as popular in England as the original was in France, and procured for him the epithet, after his own fashion, of 'silver-tongued Sylvester,' are to be found all the absurd and revolting defects noticed by the French critics, in spite of an occasional fine verse or thought, acknowledged by the critics of both countries. (*Biographie Universelle*; Sylvester, *Du Bartas*, &c.)

BARTHELEMY, JEAN JACQUES, was born at Cassis, near Aubagne, in Provence, 20th January 1716. At twelve years of age he entered the College of the Fathers de l'Oratoire at Marseille, and commenced his studies under Father Renaud, a man of considerable learning. Being intended for the ecclesiastical profession, he went next into the Seminary of the Jesuits, where he studied philosophy and theology, and at the same time applied himself to the Greek and Oriental languages. He afterwards studied numismatics under Cary, a well-known antiquarian. In 1743 he proceeded to Paris, where he made the acquaintance of Gros de Boze, secretary to the Academy of Inscriptions and Belles Lettres, and keeper of the king's cabinet of medals. In 1745 Gros de Boze took Barthelémy as his assistant in the cabinet, and after Gros' death, Barthelémy succeeded him as keeper. Meantime Barthelémy had become known to the learned of Paris, and had written several dissertations on ancient coins, and on the Phœnician, Samaritan, and Palmyrene characters. In 1754 he was commissioned by the Count d'Argenson to travel in Italy, chiefly for the purpose of collecting medals for the king's cabinet. At Rome he became acquainted with the learned Cardinals Passionei, Albani, and Spinelli, and was presented to Benedict XIV. He made also the acquaintance of Joseph Simon Assemani, of Bosovich, Firenze, and other distin-

guished men who were living in Rome at that time. He thence went to Naples, and examined the newly-discovered antiquities of Pompeii and Herculaneum. On his return to Rome he was introduced to the Count de Stainville, then French ambassador to the papal court, and his lady, and this acquaintance decided the future destiny of Barthelémy. The Count, on his return to France, became Duke of Choiseul, and first minister of Louis XV. In his elevation he did not forget Barthelémy, for whom he had conceived a sincere esteem, but loaded him with unasked favours. He bestowed on him several pensions, made him treasurer of St.-Martin of Tours, and, lastly, secretary-general to the Swiss and Grison regiments in the French service, which last situation alone was worth 20,000 francs per annum. Barthelémy made a good use of his income; he assisted many of his less fortunate brethren in the career of science, he provided for his nephews and nieces, and himself continued to live soberly and modestly. In 1760 he published a dissertation on the celebrated mosaic of Palestrina, which he explained to be an allegorical representation of the arrival of Hadrian in Egypt. The Academy of Inscriptions and Belles Lettres received him among its members, and he contributed many dissertations to the 'Mémoires' of that learned body. In 1766 he published 'Lettres sur quelques Monumens Phœniciens et sur les Alphabets qui en résultent.' He next published 'Entretiens sur l'État de la Musique Grecque vers le Quatrième Siècle,' 8vo, Paris, 1777; 'Essai d'une Paléographie Numismatique;' and 'Dissertation sur une Inscription Grecque relative aux Finances des Athéniens.' But the work which has made his name popular is his 'Voyage du Jeune Anacharsis en Grèce,' 4 vols. 4to, Paris, 1788, and 7 vols. 8vo, 1789; a work which for many years formed a text-book in the French classes of most large schools in this country. In his own country the work speedily became extremely popular, and it was long said that the great mass of moderately educated French people derived from it their notions of the geography, laws, polity, commerce, and finances of the Greek republics, and more especially of Athens; of their education, habits, and manners; their amusements, theatres, games, and festivals; their religious rites; of their philosophers and their various sects; the state of the sciences and arts, &c. But the form of the work, though certainly attractive to the general reader, is not well calculated to give sound information in a department of learning so extensive and multifarious. The admixture of fiction with real facts is not very favourable to strict historical accuracy. With regard to the pictures of ancient manners, Barthelémy says himself in his introduction, "Such details are but faintly indicated in the ancient writers, and they have occasioned numerous controversies among modern critics. I have long discussed those sketches of manners which I have introduced in my work, and I have afterwards suppressed part of them in the revival, but perhaps I have not gone far enough in the work of suppression." And again, "Had I examined my strength, instead of consulting my courage, and of being led away by the attractions of the subject, I should never have undertaken this work." This ingenuous confession renders criticism superfluous.

The great French revolution, which found Barthelémy immersed in his favourite studies, deprived him of his income of about 25,000 francs; but this affected him little. The gloom of despondency seized him when he saw his best and oldest friends led to prison, and thence to the scaffold. He himself, then nearly eighty years of age, was denounced as an aristocrat, and suddenly taken to prison. The arrest of the aged Barthelémy however proceeded merely from some obscure informer; the Jacobins themselves were ashamed of it; and Danton, the celebrated terrorist, procured his release the next day. Citizen Paré, the pro tempore Minister of the Interior, even offered Barthelémy the place of chief librarian of the Royal, or, as it had then become, the National Library. But he now felt weary of life; even literary and scientific pursuits had no longer any attractions for him; and his desire for death was not long withheld. He expired in his house at Paris, in the arms of his nephew, on the 30th of April 1795. He was buried without any ceremony, according to the custom of those times.

Barthelémy's 'Œuvres Diverses,' 2 vols. 8vo, Paris, 1798, contain a life of the author by a brother academician, and a catalogue of his works, notes taken during his journey in Italy, dissertations on the antiquities of Herculaneum and the tables of Heraclea, reflections on some Mexican paintings, and researches on the distribution of the booty in the wars of the Greeks and Romans. Another posthumous work of Barthelémy is the 'Voyage en Italie, imprimé sur ses Lettres Originales écrites au Comte de Caylus,' 8vo, Paris, 1802.

BARTHEZ, or BARTHES, PAUL JOSEPH, a physician and physiologist, was born at Montpellier, December 11, 1734. He began the study of medicine at Montpellier, in 1750, and obtained the degree of doctor in 1753. After this he went to Paris, where he made the acquaintance of some of the most distinguished literary persons then in the metropolis. While there he wrote two essays, which were rewarded with prizes from the Academy of Inscriptions. In 1756 he was employed as physician to the army, which he soon quitted, after being attacked with severe fever, and returned to Paris, where he became associated with the leading philosophers of the day as joint editor of the 'Journal des Savants,' and of the 'Encyclopédie Méthodique.' In 1759 he was appointed to a professorship at Montpellier. In his lectures he promulgated the doctrines he had announced in his early essays, which he afterwards enlarged and published,

namely, 'Oratio de Principio Vitali Hominis,' one vol. 4to, Montpellier, 1773; 'Nova Doctrina de Functionibus Corporis Humani,' Montpellier, 1774. In these works he endeavoured to point out, that the actions in the human body are dependent upon a vital principle, and that the functions of organised matter are to be studied in a different way from the properties of inorganic matter. These doctrines he correctly applied to vegetable as well as animal bodies, for he taught vegetable physiology as well as medicine. Another work gave more scope for the development of his views, namely, 'Nouveaux Eléments de la Science de l'Homme,' one vol. 8vo, Montpellier, 1778, of which a second edition was published by him at Paris in two vols. 8vo, 1806. By the dissemination of his views on these subjects, Barthes proved a valuable coadjutor to Haller, Cullen, and the other eminent physiologists of that time.

In 1774 he was made assistant-chancellor, and afterwards sole chancellor, of the University of Montpellier. In 1780 he was summoned to Paris, to assume the duties of consulting physician to the king, and first physician to the Duke of Orleans. He continued to practise his profession with increasing reputation for ten years, when the struggles of the revolution drove him from the metropolis. He took refuge at Carcassonne, where he practised medicine gratuitously, and devoted himself to study, the result of which was a treatise, 'Nouvelle Mécanique des Mouvements de l'Homme et des Animaux.' Some years afterwards, the faculties of medicine having been re-established, he was appointed honorary professor at Montpellier, and in 1801 pronounced his 'Discours sur le Génie d'Hippocrate.' In 1802 he was appointed physician to the Emperor Napoleon, and soon after published a treatise, 'Des Maladies Goutteuses,' two vols. 8vo, which is deemed inferior to his former publications. In 1806, after an attack of fever, he expired on the 15th of October, in the seventy-second year of his age.

He left behind him two works, which were afterwards published—1, 'Traité du Beau,' one vol. 8vo, Paris, 1807; and 2, 'Consultations de Médecine,' two vols. 8vo, Paris, 1810.

(Lorlat, *Exposition de la Doctrine Médicale de M. Barthes; Biographie Universelle*; Thomson, *Life of Cullen*, vol. i. p. 445.)

BARTHOLINE or BARTHOLINUS, ERASMUS, born at Roskild in Denmark, 1625, died in 1698; was the son of Gaspard Bartholinus, who, like several of his sons and grandsons, was known as a physician and writer on medicine. Erasmus Bartholine was professor of geometry, and afterwards of medicine, at Copenhagen. ('Biog. Univ.')

His principal work is 'De Cometa,' Copenhagen, 1664-65, in which he treats of comets after the manner of Descartes. (Weidler, p. 508.) He published several other works.

BARTHOLINE, THOMAS, son of Gaspard, was born at Copenhagen, 20th of October, 1616. After some years' study at the university of his native place, following the example of his father, he visited the most celebrated schools of Europe, at almost all of which he published some work; thus leaving at each a memorial of his assiduity and talents. At Leyden, where he resided from 1637 to 1640, he re-published his father's 'Anatomie Institutiones,' with additions, 1641, 1 vol. 8vo. He afterwards spent two years at Paris and Montpellier. From France he went to Padua, where he lived three years, and was greatly distinguished among the students. After visiting the greater part of Italy and passing over to Malta, he returned to Padua, and thence proceeded to Basle, where he took the degree of Doctor of Medicine, having chosen for his thesis 'De Phrenitide,' 4to, Basle, 1645. In the following year he returned to Copenhagen with a large collection of books, in addition to the stores of knowledge which he had acquired. In 1647 he was appointed professor of mathematics in the University of Copenhagen, which situation he exchanged the following year for the chair of anatomy. During the time he held this office he published a great many works, particularly on subjects connected with anatomy and medicine. Some of these treat of anatomical discoveries then or recently made, the most celebrated of which was the discovery of the 'lymphatic vessels,' the merit of which he assigns to himself, though his claim is contested in favour of Rudbeck, a Swedish anatomist, who, in October and November 1650, and the greater part of the following year, made many experiments to discover the course and termination of the 'lacteals,' and the testimony of Haller is in favour of Rudbeck. Bartholine's work is entitled 'Vasa Lymphatica in Homine nuper inventa,' Hafniae, 1654.

Another important work of his is entitled 'Dissertatio Anatomica de Hepate Defuncto novis Bilsionorum Observationibus Opposita,' Hafniae, 1661, 8vo. Up to the time of Bartholine the liver was supposed to be the sole organ of sanguification, a doctrine which he disproved in this and other works. In 1661, his health being very delicate, he resigned his professorship, and retired to the country, of which he was extremely fond. Surrounded by his books, he hoped to spend the remainder of his life in study and tranquillity, but in 1670 a fire destroyed his house, his library, and his manuscripts. After this event he returned to Copenhagen, where the king appointed him his physician; and in addition to his salary granted him an exemption from taxes. The University of Copenhagen nominated him librarian; and in 1675 the king appointed him a member of the grand council of Denmark.

He published many successive editions of his 'Anatomia,' which

was also reprinted in various countries of Europe, and it continued to be the common text-book of anatomy till the publication of Verheylen in 1693. Another important publication is the 'Historiarum Anatomicarum Centuriae VI,' of which there is a complete analysis in Haller's 'Bibliotheca Medica,' vol. ii. p. 654. A valuable work of a similar kind, but consisting entirely of morbid appearances found on dissection, was unfortunately destroyed by the flames. This mode of extending our knowledge he enforced in a subsequent work, 'Consilium de Anatomia practica ex cadaveris moribus adornanda, cum Operum Auctoris hactenus Editorum Catalogo,' Hafniae, 1774, 4to. Another interesting work, though of an earlier date, is 'De luce Hominorum et Brutorum,' Leidæ, 1647, 8vo, and Hafniae, 1663, 1669; to which last edition is appended Gesner's treatise, 'De raris et admirandis herbis quæ noctu lucent.' It treats of phosphorescent appearances. His works altogether amount to sixty-six, one of the last of which was 'De Peregrinatione Medica,' Hafniae, 1674, folio, being an account of his travels, with advice to his two sons how to travel with advantage.

Bartholine died at Copenhagen, December 4, 1680, in the sixty-fifth year of his age, leaving behind him five sons and three daughters, most of whom became distinguished for their talents and learning. (*Encyclopédie Méthodique*; Haller, *Bibliotheca Medica, et B. Anatomica*.)

BARTHOLINE, or BARTHOLINUS, THOMAS, son of the preceding, born in 1659, became eminent in the science of jurisprudence, in the prosecution of which, after studying at the University of Copenhagen, he proceeded to the universities of Leyden, Paris, Leipzig, and Oxford. Upon his return home he was appointed Professor of History and Civil Law; and held the offices of assessor of the consistory, secretary to the king, antiquary, and keeper of the royal archives. He died November 5th, 1690. He published—1. 'De Longobardis,' 4to, 1676; 2. 'De Holgero Dano,' 8vo, 1677; 3. 'De Equestræ Ordinæ Danebrogici à Christiano V. instaurati origine,' fol.; 4. 'De Causis Mortis à Danis gentilibus contemptæ,' 4to; 5. 'Antiquitatum Danicarum Libri tres,' 4to, 1689; 6. 'De Legendis Libris,' 7. 'Orationes et Carmina.' He left also, but unfinished, an 'Ecclesiastical History of the North.' It was from his work 'De Causis Mortis,' &c., that Gray translated his 'Descent of Odin.' (Moreri, *Diction.*, ii. p. 90; Chalmers, *Biog. Dict.*, vol. iv. p. 74.)

BARTHOLOMEW, ST., the Apostle, is mentioned in the list of the Twelve Apostles appointed by Christ, in Matthew x., Mark iii., and Luke vi. In the first chapter of John the name of Bartholomew is omitted, and that of Nathaniel inserted. It is generally supposed that these names represent the same person. In Acts i. Bartholomew is named as present at the gift of tongues. This is all that is positively known of him, except that he was a native of Galilee. Tradition, as handed down to us by many ancient writers, records that he proceeded to preach the Gospel in India. On his return, St. Bartholomew met St. Philip at Hieropolis in Phrygia, and Chrysostom relates that he preached Christianity in some parts of Asia. Nothing certain is known of the time, place, or manner of his death. The Greek and Roman Catholic churches agree in fixing the place at a town on the Caspian Sea. The mode was crucifixion, according to the Greeks; the Roman Catholics adding being flayed alive. Michel Angelo, in the Sixtine Chapel, has depicted the apostle as holding his skin in one hand, and the cross in the other. No writings of any sort have descended to us from St. Bartholomew. Two works, 'The Writings of Bartholomew the Apostle,' and 'The Gospel of St. Bartholomew,' are mentioned by writers within the first four centuries of the Christian era, but they no longer exist, and are deemed to have been spurious. The English church holds the festival of St. Bartholomew on the 24th of August. The relics of the saint, after many changes, are said to rest under the high altar of St. Bartholomew's church at Rome.

BARTOLI, DANIELE, was born at Ferrara, in 1608. At the age of fifteen he entered the Order of the Jesuits. He was very desirous to go to India, to join the missionaries of his order, who were then engaged in spreading Christianity through the East; but his superiors, judging that he would be more useful at home, employed him as a preacher in various parts of Italy. As he was proceeding to Palermo, to preach there during the Lent of 1646, he was shipwrecked on the island of Capri, and afterwards continued his voyage in another vessel. Although he had lost the manuscript of his sermons, he contrived, by means of a few fragments which he had preserved, and with the assistance of a good memory, to go through his 'Quaresimale' of about forty sermons, to the satisfaction of the audience. In 1650 he was sent for to Rome by the Father-General, and commissioned to write the history of the Order in the Italian language. He divided his subject by treating successively of the different parts of the world in which the Order had established itself. He began with Asia, 'Istoria della Compagnia di Gesù, l'Asia, parte prima,' fol., Roma, 1653. In this volume he treats of the first missionaries sent by the Jesuits to the East, beginning with Francisco Xavier, who was styled the Apostle of the Indies. He describes the first success of the missions on the Malabar and Coromandel coasts, at Malacca, &c. The work may serve to a certain extent as a supplement to Barro's 'Asia Portugueza.' Bartoli published next, 'Il Giappone, seconda parte dell'Asia,' fol., Roma, 1660;—perhaps the most interesting of his works. The rapid diffusion of Christianity in

Japan, and its subsequent total eradication by fire and sword, are remarkable historical events. Bartoli's narrative embraces the whole history of Christianity in Japan, from the landing of its first preacher, Xavier, in 1549, till its complete extinction in 1637, when Japan was closed against all Europeans, with the exception of the Dutch, who were allowed to trade at the harbour of Nangasaki; an exception which has continued in force till our own day, when the treaties of England and America with Japan concluded in 1855, have in some measure opened the country to the British and American commerce. Bartoli gives a very good sketch of the character and habits of the Japanese.

Bartoli's next publication was 'La Cina, terza parte dell' Asia,' fol., Roma, 1663. This work, which embraces also the missions to Cochin China and Tonkin, concludes Bartoli's account of Asia—an account replete with interest, for these may be looked upon as the heroic times of the Order of Jesuits. He next published 'L'Italia, prima parte dell' Europa,' fol., Roma, 1673;—and 'Dell' Inghilterra, parte dell' Europa,' fol., Roma, 1667. This is a history of the English Catholics, principally under Elizabeth and James I.: the author passes rapidly over the reign of Mary, "who," he says, "was obliged to use the sword, in order to cut off the mortified limbs of the nation, for fear they should infect the rest." Bartoli wrote also the life of Ignatius de Loyola, the founder of the Jesuits, 'Vita e Istituto di S. Ignazio,' fol., Roma, 1689; and the lives of the Generals Caraffa and Borgia, and other distinguished members of his order. These various works contain a vast quantity of materials for the history of the first century of the Society of Jesuits. But he wrote also several books on morality: 'La Ricreazione del Savio,' Milano, 1660; being considerations on the wonders of nature, from which he derives moral and religious arguments for the conduct of a wise man; 'Deila Geografia trasportata al Morale,' Roma, 1664; and 'L'Uomo di Lettere difeso ed emendato,' in which he gives much excellent advice to men of letters—on their conduct, their pursuits, and their style. This work went through many editions in Italian, and has been translated into English, by Thomas Salisbury, 8vo, London, 1668.

Bartoli wrote treatises on several physical phenomena—on sound and hearing, 'Del Suono, de' Tremori armonici, e dell' Udito,' 4to, Roma, 1679; on ice, 'Del Ghiaccio, e della Coagulazione,' 4to, Roma, 1681; on the depression and expansion of quicksilver in tubes, 'La Tensione e la Pressione disputanti qual di loro soetenga l'Argento Vivo ne' Cannelli dopo fattone il vuoto,' 12mo, Venezia, 1679.

Bartoli also wrote several works on the Italian language: 'Il Torto e il Diritto del non si, può,' 12mo, Roma, 1655, a work much esteemed; and 'Dell' Ortografia Italiana,' ibid. 1670. He contributed also to Mambelli's work called 'Cinonio, Osservazioni sulla Lingua Italiana,' one of the best works on Italian grammar. An edition of Bartoli's minor works, including some of his sermons, was published at Venice, 3 vols. 4to, 1716-17. A new edition of Bartoli's works was a few years back brought out in Italy.

Bartoli was appointed Rector of the Gregorian or Roman College in 1671. He died at Rome, January 13, 1685, aged 77 years.

(Mazzuchelli, *Scrittori d'Italia*; Tiraboschi, *Storia della Letteratura Italiana*; and Bartoli's works above quoted.)

BARTOLI, PIETRO SANTO, an Italian painter and engraver, born at Perugia in 1635. As an engraver he obtained a great reputation, more however from the subjects and the number of his prints than for any particular excellence of execution. He was the scholar of Nicholas Poussin, from whom he probably, in some degree, derived his great love of the works of ancient art. As a painter he did very little beyond copying, in which he was so excellent, that even Poussin himself is said to have had difficulty in distinguishing between his own pictures and the copies made of them by Bartoli. Bartoli had a correct appreciation of the merits of Greek design, and though technically his prints have little excellence, they are in most cases true to their originals. His prints, mostly etchings, which amount to many hundreds, are chiefly from ancient basso-relievi or paintings in the ruins in or about Rome and other Italian cities. He was also a printseller, and established a business in Rome, which was continued after his death by his son Francesco Bartoli. P. S. Bartoli died in 1700.

Winckelmann was a great admirer of the works of Bartoli, and recommends young artists to study them in order to acquire a proper appreciation of ancient art. They are free, but slightly executed, and all in the same style. The following are among the principal collections executed by Bartoli:—'Admiranda Romanarum Antiquitatum ac Veteris Sculpturæ Vestigia,' with remarks by Bellori; 'Romanæ Magnitudinis Monumenta'; 'Veteres Arcus Augustorum triumphus insignes, ex reliquiis quæ Romæ adhuc supersunt'; 'Le Pitture Antiche delle Grotte di Roma e del Sepulchro de' Nasoni'; 'Gli Antichi Sepolchri, ovvero Mauolei Romani ed Etruschi, trovati in Roma'; and 'Recueil de Peintures Antiques imitées fidèlement, pour les couleurs et pour les traits, d'après les dessins coloriés faits par P. S. Bartoli,' Paris, 33 pl. folio, 1757. Of the last work thirty copies only were published of the first edition: a second but inferior edition was published in 1787, with a few additional plates.

(Pascoli, *Vite de' Pittori, &c. Moderni*; Lanzi, *Storia Pittorica, &c.*; Heineken, *Dictionnaire des Artistes, &c.*)

BARTOLOMEO, FRA. [BACCIO, DELLA PORTA.]

BARTOLOZZI, FRANCESCO. This distinguished engraver was born in Florence in 1730, or according to some authorities in 1725. He received his first instructions in drawing under Gaetano Biagio and Ignazio Hugford, in the Florentine academy. Here his acquaintance commenced with Giovanni Cipriani, with whom his name became afterwards intimately associated by their joint productions in art. Bartolozzi commenced engraving under Joseph Wagner, of Venice, and when the term of his engagement with that master had expired, he married a Venetian lady, and went to Rome, whither he had been invited by Cardinal Bottari. Here he produced his fine plates from the life of St. Nilus, and a series of portraits for a new edition of Vasari. Having completed these works he returned to Venice, where he was engaged by Mr. Dalton, librarian to George III., to engrave a set of drawings by Guercino, which having accomplished, he accepted an invitation from Mr. Dalton to remove to England, and to continue engraving for him on a stipend of 300*l.* per annum. The series of plates from Guercino were completed in this country. Some of the earliest performances of Bartolozzi in England were designs for tickets for the Opera House. Bartolozzi then produced his engraving of Clytie, after Annibale Carracci, and that of the Virgin and Child, after Carlo Doles. These plates are well-known; they are in the highest degree brilliant and spirited, and would alone have been sufficient to establish the name of Bartolozzi as an engraver of the very highest order. A style of dotted engraving printed in red ink was introduced about this time, a bad and meretricious practice, the success of which was in great measure attributable to the example of Bartolozzi. A prodigious number of the paintings and drawings of Cipriani, who had likewise settled in England, were engraved by Bartolozzi; the styles of the painter and engraver harmonise admirably; grace, elegance, and suavity, are the characteristics of each, and their works for a considerable time held almost unrivalled possession of the public favour. Bartolozzi showed however that when engaged on the works of more efficient masters he could transmit them to the copper with adequate force and effect. Examples of this may be seen in the engravings of Prometheus devoured by the Vulture, after Michel Angelo; the Adulteress before Christ, after Agostino Carracci; Rebecca hiding the Idols of her Father, after Pietro da Cortona; St. Luke painting the Portrait of the Virgin, after Cantarini; and various others. One of Bartolozzi's earliest patrons was Alderman Boydel, for whose Shakspeare Gallery he engraved a number of fine plates. Among his minor works, his etchings in imitation of the great masters, and of the Marlborough gems, are proofs of his versatile and exquisite taste.

In the year 1802 Bartolozzi received an invitation from the Prince Regent of Portugal to settle at Lisbon, as superintendent of a school of engravers, with a salary of 100*l.* per annum, to which was annexed a handsome residence and the profits of the engravings. Bartolozzi left England in his seventy-fifth year, and was received at Lisbon with all the respect due to his distinguished talents. He died in that capital in his eighty-eighth year. His private character was in the highest degree amiable, and it may be mentioned, among many other instances of his kind and generous disposition, that he finished gratuitously a plate which had been commenced by Ryland, having been requested to do so by that unhappy man when under sentence of death for forgery. Several of Bartolozzi's pupils rose to eminence; among them, Cheesman, Sherwin, Tomkins, and the two Vendramini.

BARTON, BENJAMIN SMITH, was born in the year 1766 at Lancaster, in Pennsylvania. His father was a respectable episcopal clergyman, who divided his time between the duties of his sacred office and the pursuit of natural history, especially of mineralogy; but he died when the subject of this notice was only fourteen years old, leaving his children so ill-provided for, that the early part of his son Benjamin's life was an incessant struggle with want and poverty. In this struggle he, by indomitable perseverance, overcame the difficulties of his lot. After gaining the essential parts of a learned education under Dr. Andrews of Philadelphia, Mr. Barton prosecuted his medical studies in the university of that city, where he distinguished himself so much by his acquirements in science as to secure the friendship of his uncle, Dr. Rittenhouse, who proved ever after his father and supporter. In 1785 Mr. Barton accompanied his uncle and the other American commissioners in fixing the western boundary of Philadelphia. On this occasion he was led into some curious investigations concerning the manners of the American Indians, their history, and their traditional medicines, by which he gained considerable reputation. When about twenty-one, Mr. Barton proceeded to Edinburgh, with a view to complete his medical education. He remained there about two years, when, on account of some dissatisfaction with two of the professors, who he fancied did not show him sufficient attention, he went to Göttingen to graduate, although he had distinguished himself at Edinburgh by gaining the Harveian prize of the Royal Medical Society for his dissertation on the medical qualities of the herbane. Upon his return from Europe Dr. Barton established himself in Philadelphia as a physician, and soon found some practice. When only twenty-four he was appointed professor of natural history and botany in the College of Philadelphia, and thus was the earliest teacher of natural science in the transatlantic world, an office the duties of which he continued zealously and successfully to discharge for twenty-six years. In 1802 Dr. Barton was elected vice-president of the American Philosophical Society; when thirty

he became professor of materia medica; upon the death of Dr. Rush he succeeded him in the chair of the practice of medicine, which he held till his death; and in the year 1809 he became president of the Philadelphia Medical Society, the highest mark of respect for professional talent which it was in the power of his fellow-citizens to bestow. In a short time however his incessant labours, and the heavy duties of his professional avocations, told upon his constitution. At last, after visiting Europe in a vain attempt to restore his shattered powers, he died in December 1815.

The writings of Dr. Barton consist chiefly of papers upon various subjects relating to the natural history and antiquities of North America, and an elementary work on botany, which passed through two American editions. Dr. Barton was the first person to notice the curious power of camphor when steeped in water to revive faded flowers, showing it to be a vegetable stimulant of peculiar energy. When his circumstances became easy, Dr. Barton afforded valuable assistance to those labourers in science who were less favourably situated. At his private charge the late Frederick Pursh was sent to the Alleghany Mountains and the western territory of the Southern States for the sake of exploring their vegetable productions; on which occasion he acquired the most valuable part of the materials from which he subsequently prepared his American 'Flora.' In 1810 Dr. Barton enabled Mr. Nuttall to visit the northern and north-western parts of the United States and the adjoining British territories with a similar object in view: how large an accession of discovery resulted from this also is well known from the works both of Pursh and of Nuttall himself. These two botanists agreed to name one of their discoveries 'Bartonia,' in honour of their patron.

(*Biographical Sketch of Professor Barton*, by his nephew, Dr. William P. C. Barton.)

BARTON, BERNARD, was born in London in 1784. His parents were members of the Society of Friends, and to the tenets of that sect Bernard Barton always adhered. In 1806 he went to Woodbridge in Suffolk; and there in 1810 he entered as a clerk the banking house of Messrs. Alexander, in whose employment he continued almost to his death. Bernard Barton first claimed public attention as a poet in 1812, by the publication of a volume of 'Metrical Effusions.' This was followed in 1820 by a volume of 'Poems,' and thenceforward as long as he lived he continued to issue at intervals either brief occasional pieces, or, though much more rarely, a poem of greater length and loftier pretensions.

Bernard Barton attracted an amount of attention and popularity far beyond that to which his poetic merits would seem to have entitled him. This was perhaps mainly owing to his presenting the then unusual phenomenon of a Quaker poet—the title indeed by which he came to be commonly known; but it likewise no doubt was partly due to the evidently unaffected tone of simple religious earnestness which pervades all his writings. He wrote with ease; and like most easily written poetry, his verses are more characterised by fluency than power. But though often diluted almost to feebleness, there is a vein of natural feeling and quiet unobtrusive benevolence running through his verses, which render them pleasing to all but the more critical class of readers. Barton was a man of refined habits; a lover of nature, and fond of paintings and other works of art to a degree then very uncommon among members of his sect. His moral character was blameless, and few men in his position of life won so wide and general a share of esteem as did Bernard Barton. Some years before his death he received, through the instrumentality of Sir Robert Peel, the grant of a pension of 100*l.* per annum. He died suddenly of spasm in the heart, February 19, 1849. Besides the works noticed above, Barton published 'Napoleon and Other Poems,' 1822; 'Poetic Vigils,' 1824; 'Devotional Verses,' 1826; 'Household Verses,' 'New Year's Eve,' and numerous occasional verses and pieces published separately, and in magazines, annuals, &c.

(*Memoir*, prefixed to his Poems; *Gentleman's Magazine*, 1849.)

BARTON, ELIZABETH, the 'holy maid of Kent.' Respecting the early life of this woman we possess no information. She first becomes known to us in 1525, when, while a servant at an inn at Aldington in Kent, she began to acquire a local reputation for sanctity and miraculous endowments. She was subject to fits of an epileptical character, and, in the paroxysms of her disorder, vented her feelings in incoherent phrases and exclamations, which one Richard Master, parson of Aldington, took advantage of to make people believe that she was an instrument of divine revelation. Master and Dr. Bocking, a monk of Canterbury, took her under their direction, and instructed her in the tricks she should play. At first it is probable that she was simply their instrument, but she soon appears to have become a kind of accomplice, though we cannot perhaps fairly consider her, in any part of her career, as of perfectly sound mind. A successful prediction lent its aid to the general delusion. A child of the master of the inn happened to be ill, when Elizabeth was attacked by one of her fits. On recovering, she inquired whether the child was dead? She was told that it was still living. "It will not live, I announce to you; its death has been revealed to me in a vision," was the answer. The child died, and Elizabeth was immediately regarded as one favoured by Heaven with the gift of prophecy. She soon after entered the convent of St. Sepulchre's at Canterbury, and became a nun.

In this new situation her ecstasies and revelations were multiplied,

and she became generally known by the appellation of the 'holy maid of Kent.' Several persons of distinction, "nobles as well as spiritual persons," to quote from the statute, believed in her divine mission. Bishop Fisher, the most honest prelate of his time, and Archbishop Warham, a learned and amiable man, countenanced her pretensions; and, above all, the strong intellect and upright heart of Sir Thomas More did not secure him against the errors of his age. (See Cromwell's letter to Fisher in the Appendix to Burnet. Fisher's speech in defence of himself in the affair of the Maid of Kent is quoted at length in the 'Parliamentary History,' vol. i. p. 520, from Collier.) At a subsequent time, shortly before his execution, More changed his tone, and declared her, in his letter to Cromwell, to be "a lewd nun," and a hypocrite.

Had this poor creature confined her prophecies to the common occurrences of life, or even to the current topics of religious controversy, it is more than probable that she would have been permitted to die in peace; but, led by her zeal, or more probably worked upon by others, she boldly prophesied against evil-doers in high places, and in reference to the divorce from Catherine and marriage of the king with Anne Boleyn, declared "that she had knowledge by revelation from Heaven that God was highly displeased with our said sovereign lord, and that if he proceeded in the said divorce and separation and married again, he should no longer be king of this realm; and that, in the estimation of Almighty God, he should not be king one hour, and that he should die a villain's death." She was at the time so popular, and so extensively patronised by many of the clergy, and such pains were taken on their part to diffuse her sentiments respecting the divorce, that the government at length proceeded to take active measures against her and her adherents. Accordingly, in November 1533, the nun, with five priests and three lay gentlemen, her accomplices, were brought before the Star Chamber and sentenced to do public penance as impostors at St. Paul's Cross. It is stated by the more zealous anti-Romish writers, that the nun did confess herself to be an impostor, and that she was tempted to claim inspiration at the instigation of the devil; but it is much more probable that a false confession was obtained from her with the hope of saving her life, than that a simple woman should have contrived and carried on, for many years, a system of complicated mental and physical imposture. But the nun's confession, whatever were its motives, availed her nothing. From the pillory she and her companions were led back to prison, where they lay till the following January, when they were attainted of high treason. On the 21st April 1534, the nun was beheaded at Tyburn, together with the five priests.

BARTSCH, ADAM VON, a distinguished designer and engraver, was born at Vienna in 1757. He was educated in the School of Engraving at Vienna under Professor Schmutzer, and distinguished himself in his sixteenth year by a set of engravings of all the gold and silver medals struck by order of the Empress Maria Theresa, through which he obtained the appointment of scribe in the royal library. In 1781 he was appointed keeper of the prints of the royal collection, which led eventually to the publication of his well-known work, 'Le Peintre-Graveur,' in 21 vols. 8vo, 1803-21, the description of the greater part of the works of the principal engravers of Europe, and to which he now chiefly owes his reputation. He is also the author of several similar works on a smaller scale, but they are all more descriptive than critical. His etchings are numerous, amounting to 505, dating from 1782 until 1815, including imitations of old etchings and drawings, prints from his own designs, and from the works of other masters: of these a catalogue was published by his son in 1818. Bartsch completely re-arranged, and made considerable additions to, the immense imperial collection of prints at Vienna.

In 1812 Bartsch was decorated with the order of Leopold, and in 1816 he was appointed principal Custos of the Imperial Library of Vienna; he had also the titular rank of hofrath, or aulic-councillor. He died at Vienna in 1821.

Bartsch was the author of the following works, among others, published at Vienna:—'Catalogue Raisonné des Dessins Originaux des plus Grands Maîtres Anciens et Modernes, qui faisoient partie du Cabinet de Prince Ch. de Ligne,' 1794; 'Catalogue raisonné des Estampes Gravées à l'Eau Forte par Guido Reni et ceux de ses disciples, S. Catarini, Jean André, Elizabeth Sirani, et Laurent Loli,' 1795; 'Catalogue raisonné des Estampes qui forment l'Œuvre de Rembrandt et ceux de ses principaux Imitateurs, composé par Germain, Helle, Glomy, P. Yver,' nouv. ed., 1797; 'Catalogue raisonné de toutes les Estampes qui forment l'Œuvre de Lucas de Leyde,' 1798. He published also in 1797 an edition of the 'Triumph of the Emperor Maximilian I.,' with a French translation of the old German text, 'Le Triomphe de l'Empereur Maximilien I., en une Suite de Cent Trente-cinq Planches,' &c.

BARUCH. Among the various individuals called by the name of Baruch, the most important was Baruch, the scribe and assistant of the prophet Jeremiah. The warnings, denunciations, and prophecies of Jeremiah were continued during the reigns of Josiah, Jehoiakim, Jehoiachin, and Zedekiah, kings of Judah. In the fourth year of the reign of Jehoiakim, about B.C. 607, while Jeremiah was closely confined, he received a divine command to cause all the prophecies which he had uttered to be written in a roll. He accordingly summoned Baruch, the scribe, who wrote from the mouth of Jeremiah all the words of his former denunciations. Baruch afterwards read the roll before the

people, and also before the princes. Having heard the commencement of the roll, Jehoiakim cut it in pieces, and cast it into the fire. Jehoiakim commanded his servants to apprehend both the prophet and the scribe, but they were already concealed (B.C. 606). After the destruction of Jerusalem, when Nebuchadnezzar led the Jews captive to Babylon, Baruch and his master Jeremiah obtained permission to remain in Palestine; but both were afterwards carried into Egypt by Johanan-Ben-Kereach, B.C. 588. (Comp. Jer. xxxii. 12-16; xxxvi. 4, 17, 27, 32; xliii. 3-6; xlv. 1, 2: 'Josephi Antiquitates,' x. 9, 1.) From some of these passages we learn that Baruch was present at the destruction of Jerusalem. Concerning the close of Baruch's life there exists a diversity of opinion. According to one tradition, Baruch died in Egypt; another asserts that he went from Egypt to Babylon, and died there twelve years after the destruction of Jerusalem, leaving a celebrated disciple in the person of Ezra, the scribe, and subsequent leader of the Jews.

The most ancient copies of the book of Baruch still extant are written in Greek; but, on account of supposed Hebraisms in the style, some learned men are of opinion that it was originally written in Hebrew. It has been published, with the rest of the Apocrypha, in a Hebrew translation, by Seckel Isaac Fränkel, Leipzig, 1830. The authenticity of the book of Baruch was not recognised either by the ancient Jews or the fathers of the Christian Church; but the Council of Trent anathematizes those who exclude it from the canon of the Old Testament. Further information concerning the book of Baruch may be found in the 'Introductions' to the Old Testament by Eichhorn, Jahn, Berthold, De Wette, and others.

(Grüneberg, *Exercitatio de Libro Baruchi Apocrypho*, Gött. 1796, 8vo.)

BASAITI, MARCO, one of the best of the early Italian painters, was born of a Greek family in the Friuli, probably about the middle of the 15th century. He lived chiefly in Venice, where he was the rival of Gian Bellini, to whom he was superior in some respects, especially in composition, in accessory groups, and in the management of the landscape or scene. Some of Basaiti's works are still, for colour, among the most brilliant paintings extant. There are several of his works in Venice, upon one of which, in the church of San Pietro di Castello, is the date of MDXX; and in the church of San Giobbe there is an excellent picture of Christ praying in the Garden, with the date 1510. Among his other best known paintings are an Ascension of the Virgin, in the church of Santa Maria degli Angeli, and an Assumption, in that of St. Peter and St. Paul; but his masterpiece is the Calling of St. Peter and St. Andrew, in the Academy of Venice, formerly in the old church Della Certosa; it is marked MDXL M. BAXIT. There is a repetition of it on wood in the Gallery of Vienna, marked, according to Mechel, 'Marcus Baxaiti f. 1515.' There is a beautiful Deposition from the Cross, by Basaiti, in the Gallery of Munich, cabinet xviii. (Mocchini, *Guida per la Città di Venezia*, 1815; Vasari; Lanzi, &c.)

BASEVI, GEORGE, an eminent architect, was born at Brighton in 1794. He was placed as a pupil with Sir John Soane, R.A., in whose office he remained for six years. He then made a professional tour through Italy and Greece for three years. He commenced practice as an architect in 1819. During his comparatively short career Mr. Basevi was employed in the construction of various descriptions of buildings, scarcely any one of which is without manifest evidence of careful study and well-cultivated taste. Among the more extensive of his works may be mentioned Belgrave-square, which was erected entirely from his designs. The churches at Brompton, Twickenham, Hove, &c., show his acquaintance with the requirements of ecclesiastical architecture. St. Mary's Hall at Brighton may also be mentioned among his more successful efforts. But his great work is the Fitzwilliam Museum at Cambridge, one of the most ornate yet chaste and effective classical edifices erected in England during the present century. It was not quite finished at his death, and, like the Conservative Club-House, St. James's-street, another of his latest works, executed by him in conjunction with Mr. Sidney Smirke, it shows that he was rapidly throwing off the trammels of precedent, and giving his fine taste and attainments fuller and freer play. But his career was suddenly cut short by a lamentable accident. Whilst examining, in company with the Dean of Ely, the works in the Bell Tower of Ely Cathedral, the restoration of which was being conducted under his direction, his foot caught against a nail in a beam from which the flooring had been removed, and he fell through an aperture on to the top of the arch under the tower, a distance of 40 feet. He died almost instantly, October 16, 1845, aged 51. The Fitzwilliam Museum was finished under the direction of Mr. Cockerell.

(*Builder*, 1845; *Gentleman's Magazine*, 1845.)

BASIL, or BASILIUS, bishop of Ancyra, A.D. 336, was ordained to that office by the bishops of the Eusebian party in the room of Marcellus, whom they had deposed; but Basil was himself excommunicated and his ordination annulled in the Council of Sardica in 347, though he still retained the see. In 351 he attended the Second Council of Sirmium, where he disputed successfully against Photinus. He was one of the greatest enemies to the Arians, but was still considered as the head of the Semi-Arians, who maintained that the Son was similar to the Father in his essence, not by nature, but by a peculiar privilege. This opinion Basil procured to be established by a council held at Ancyra in the year 358, and subsequently defended it both at Seleucia and Constantinople against the Eudoxians and

Acacians, by whom he was deposed in 360. St. Jerome informs us that Basil wrote a book against Marcellus, his predecessor, a 'Treatise on Virginity,' and some other smaller pieces, of which no remains are extant.

BASIL, or BASILIUS, commonly called **ST. BASIL**, and, on account of his learning and piety, surnamed the Great, was born at Caesarea in Cappadocia, in the year A.D. 326; Lardner says in the year 328 or 329. His father was named Basilius, and his mother Emmelia. In his earlier years he received instruction from his father, but went afterwards and studied at Antioch, at Constantinople, at Caesarea, and at Athens. At Athens Basil formed a close intimacy with Gregory of Nazianzus. He returned to his native country about the year 355, and taught rhetoric. Some time after this he travelled into Syria, Egypt, and Libya, to visit the monasteries of those countries. Upon his return home he instituted an order of monastic life in the province of Pontus. Eusebius, who had succeeded to the bishopric of Caesarea in 362, conferred the order of priesthood upon Basil, who some time after, upon some difference with the bishop, retired to the solitude of his monastery, but was reconciled to him about three years after. Upon Eusebius's death in the year 370, Basil was chosen his successor. It was with some reluctance that he accepted this dignity; but no sooner was he raised to it than the emperor Valens began to persecute him because he refused to embrace the doctrine of the Arians, of which he and Gregory of Nazianzus were strenuous opponents. Valens ceased however at length to molest Basil, who now endeavoured to bring about a re-union between the eastern and western churches, which had been divided upon some points of faith, and in regard to Meletius and Paulinus, two bishops of Antioch. The western churches acknowledged Paulinus for the legal bishop; Meletius was supported by the eastern churches. But all his efforts were ineffectual, this dispute not being terminated till nine months after his death. Basil was also engaged in some contests relating to the division which the emperor had made of Cappadocia into two provinces. St. Basil had likewise some disputes with Eustathius and Apollinaris, against both of whom he wrote; and in fact he took a part in most of the controversies of his age. He died January 1, 379, his constitution being much impaired by the austerities of a monastic life.

Cave has given a list of St. Basil's works. Lardner says that many writings have been ascribed to him without ground. Several of his detached pieces were printed before the year 1500; but the first edition of the whole works, in Greek, issued from the press of Frobenius, fol., Basel, 1532, with a preface by Erasmus. The best edition is that which was published by the Benedictines of the Congregation of St. Maur, Greek and Latin, 8 vols., folio, Paris, 1721-30; the two first under the care of Père Garnier; the third, after Garnier's death, by Père Maran. Garnier took great pains in distinguishing the spurious from the genuine works of St. Basil. M. Herman, a doctor of the Sorbonne, published a 'Life of St. Basil,' 2 vols., 4to, Paris, 1764.

Syncellus ('Chronog.,' p. 203) ascribes to Basil a new recension of the 'Septuagint,' which he says was done with great care. The correspondence of Libianus and Basilius is printed in the edition of the 'Epistles of Libianus,' by J. C. Wolf, Amst., 1738, 1 vol. folio. Though Libianus was not a Christian, this does not appear to have disturbed the good understanding between Basil and the schoolmaster of Antioch.

BASILIUS, the Macedonian, emperor of Constantinople, was born of poor parents in a village of Macedonia, about A.D. 826. When 25 years of age he proceeded to Constantinople to seek for better fortune. He there found a friend in the superior of a monastery, who introduced him to the service of an officer of the court of the emperor Michael III. Having become known to that sovereign by vanquishing a giant Bulgarian in single combat, he quickly gained the emperor's favour, and became his chamberlain in 861. He soon after took a wife, who was a concubine of Michael. The patrician Bardas, a relation of the emperor, and upon whom the title of Cæsar had been conferred, became jealous of Basilius, and the Macedonian adventurer, fearing his machinations, anticipated him by accusing him of conspiring against the emperor. Although exculpated, Bardas was soon after assassinated in the emperor's tent by Basilius, who was made by Michael his colleague in the empire in 866. Michael rendering himself odious by his cruelty and debauchery, Basilius remonstrated with him in vain; and when the emperor attempted to depose him, Basilius, with some officers of the palace, when the emperor one evening retired to his room in a state of intoxication, murdered him in his bed (867).

Basilius was now proclaimed emperor; and his conduct on the throne, which he had obtained through crime, was wise and equitable. He re-established order in the empire, enforced the strict administration of justice, corrected the abuses that had crept into every branch of the administration under the profligate reign of Michael, and began the compilation of a code of laws, which was completed by his son and successor Leo, but has retained the name of Basilius. He assembled a general council at Constantinople in 869, to which Pope Adrian II. sent his legates, in which a temporary reconciliation between the eastern and the western churches was effected. Basilius carried on the war in Apulia against the Saracens, at first as an ally of the emperor Ludovicus II., but afterwards quarrelled with him and withdrew his troops. He was more successful against the Saracens in

Asia, recovered the greater part of Asia Minor, and in 872 carried the arms of the empire beyond the Euphrates, where they had not been seen for a long time. He defeated the Paulicians, a sect that had established itself in Pontus, and had been for many years in a state of revolt against the empire. Basiliius entered into a treaty of friendship with the Russians of Kiev, and sent them an archbishop, who converted many of that nation to Christianity, and from that time the Russians began to acknowledge the authority of the Greek Church. In 880 the Greeks lost Syracuse, which was taken by the Saracens after a long siege. Basiliius died in 886, of wounds which he received from a stag while hunting. He left a book of advice addressed to his son Leo, which is divided into 66 short chapters, containing many good maxims for his conduct. It has been published under the title of 'Basilli Imperatoris Exhortationum Capita LXXVI. ad Leonem filium cognomento philosophum,' Paris, 1584, 4to, by F. Morel; and also at Göttingen, 12mo, 1674, by Just Von Dransfeld. Another work by Basiliius, also addressed to Leo, was published by A. Mai in vol. ii. of his 'Vatican Collection.'

BASILIIUS II., emperor of the east, was the son of the Emperor Romanus the younger, and was born in A.D. 958. Upon the death of Romanus in 963, the crown was usurped by Phocas, who, six years after was put to death by John Zimisoes. Zimisoes took the crown for himself, but acknowledged, as his successors, Basiliius, and his younger brother Constantine, who were then minors. When Zimisoes died in 975, the two brothers were proclaimed emperors. The whole reign of Basiliius was one continual warfare against the Saracens, the Bulgarians, the Slavonians, the Emperor Otho III., and the Longobard dukes of Benevento. The war against the Bulgarians was the most obstinate, but it was also the most successful. It began in 981, and lasted till 1014, when Basiliius defeated Samuel, king of the Bulgarians, and ravaged the country round Philippopolis. Being embarrassed in his march by 15,000 prisoners whom he had made, Basiliius divided them into companies of 100 each, and then caused their eyes to be pulled out, excepting only one man in each company, who was to show his companions the way. In this manner they returned to King Samuel, who was so horrified at the sight that he fell into a swoon and died two days after. In 1019 Basiliius had subdued the whole country of the Bulgarians as far as the Danube, when it was made a Greek thema, under a ducal governorship. Wlodimir, grand-duke of the Russians, married Basiliius's sister, after having received baptism in 988, and abolished paganism throughout his dominions. Basiliius died in 1025, after a reign of fifty years. His brother Constantine, who was nominally his colleague, but had no power during his brother's life, succeeded him as sole emperor after his death.

BASING, JOHN, or DE BASINGSTOKE, who received his name from the place of his nativity in Hampshire, was an extraordinary person for his time. Though the date of his birth does not appear to be fixed, we know that he was alive in the year 1230, and studied not only at Oxford and Paris, after the custom of the age, but also at Athens; a fact remarked by Leland as uncommon in the history of English scholars at that time, who seldom proceeded farther eastward for the prosecution of their studies, and improvement in learning, than Rome or Venice. Leland says that at his return he brought with him into England various Greek manuscripts, which, together with his proficiency in that tongue, caused Hugh Grosstête, bishop of Lincoln, a great restorer of that language, to promote him to the archdeaconry of Leicester. It was upon Basing's information, as Matthew Paris tells us, that Grosstête sent to Athens for a Greek manuscript entitled 'The Testaments of the Twelve Patriarchs,' which, when obtained, he translated into Latin. The translation was printed among the 'Orthodoxographia,' fol., Basel, 1555. Matthew Paris tells us that John de Basing introduced into England a knowledge of the Greek numeral letters: "This Master John, moreover, brought the Greek numeral figures into England, together with their symbols, and the knowledge of their import, and explained them to his particular friends. By which figures also letters are represented; and, what is most remarkable, any number is represented by a single figure, which is not the case in the Roman numerals, or in ordinary arithmetic." ("De quibus figuris hoc maxime admirandum, quod unica figura quilibet numerus representatur, quod non est in Latino vel in Algoriano.") Matt. Par., edit. 1654, p. 721. The figures however which are given in fac-simile in the 'Variantes Lectiones' (signat. I. on the verso of the leaf) here copied, are neither like Greek letters nor the ordinary Arabic numerals.

Basing met with the invention at Athens, but Matthew Paris, who knew little about these matters, was mistaken in imagining that the Greeks used any such system of notation. The only manuscript of

Matthew Paris in which these numerals are found, is the enlarged work in Bene't College Library, Cambridge. Matthew Paris, in the 'Variantes Lectiones,' already referred to, observes that the units, or single numbers, are all designated by lines bearing to the left, from the chief upright line. Those representing the numbers, from ten upwards, have the adjunct-lines bearing to the right.

Matthew Paris records the death of John de Basing under the year 1252. His works were—1. 'Doctarum Concionum Liber Unus.' 2. 'Particulæ Sententiarum per Distinctiones.' 3. 'Donatus Græcorum,' a translation, probably intended to serve for instruction in the Greek tongue, as the Rudiments of Donatus did for the Latin. 4. 'Concordia Evangeliorum;' this is probably the same work which Leland calls 'Tractatus de Ordine Evangeliorum per annum.' He is said to have written other works, the titles of which are unknown.

BASKERVILLE, JOHN, a celebrated printer, was born at Wolverley, in Worcestershire, in the year 1706. He does not appear to have been brought up to any particular business: in 1726 we find him keeping a writing-school at Birmingham; a little later he, at least occasionally, was employed in cutting inscriptions on tombstones; and in 1745 he engaged in the jappanning business at the same place, by which he acquired considerable wealth. His taste for literature, and the arts connected with it, led him to direct his attention towards the improvement and perfection of the art of printing. The most obvious improvement to be effected was in the form of the letters. Mr. Caslon, previous to Baskerville's attempts at letter-founding, had cut a variety of matrices of more beautiful shapes than those of the Dutch types which up to his time had been imported into England. Baskerville carried the art to a higher degree of perfection, and even now his types would in many respects be considered models. By his unceasing efforts the art of printing was raised to a degree of perfection previously unknown in this country; and so ardently did he prosecute his favourite object, that, according to a letter addressed to Horace Walpole, dated November 2, 1762, he manufactured his own ink, presses, chases, moulds for casting, and all the apparatus for printing.

Baskerville's printing establishment does not appear to have been profitable to him. It may however be remarked that his works now possess a high value, and particularly his editions of some of the classics are highly esteemed by bibliographers, not only in this country, but on the continent. From a passage in his letter to Walpole, it would appear that in 1762 he was desirous of withdrawing from the business: "This business of printing," he says, "which I am heartily tired of, and repent I ever attempted." After 1765 little or nothing issued from his press. It is most likely that the typographical improvement which he was the means of effecting was not sufficiently appreciated at the time, and that his efforts were not very liberally encouraged. The University of Cambridge, it is true, granted him permission to print the Bible in folio, and two editions of the Book of Common Prayer; but at the same time the University required to be made a sharer in his profits by a payment of 20*l.* per thousand copies of the Bible, and 12*l.* 10*s.* for each thousand of the Prayer Book: to the Stationers' Company he had to pay 32*l.* for their permission to print the Psalms, without which the Prayer Book would have been incomplete.

Mr. Baskerville was married to the widow of Mr. Eaves; her maiden name was Ruston. He died without issue, January 8, 1775. He was a man fertile in invention, and of an active mind. By the constant endeavours which he made to attain excellence in each of the various processes connected with the arts of jappanning and printing, they were both brought to a more perfect state—a result which could scarcely have been expected from the exertions of a single individual. Mr. Baskerville was rather eccentric in his habits and opinions. He caused each panel of his carriage to be painted so as to represent a picture of his trades; and in his will he desired to be buried in his garden under a conical building which had formerly served as the base of a windmill, but which he had caused to be converted into a tomb, having an urn on its summit. This tomb was destroyed during the Birmingham riots in 1791. In 1820 some labourers, who were digging for sand on its site, discovered the leaden coffin which contained his remains; and in May 1821 it was opened for inspection. The body did not present the usual appearances of decomposition; the singular state of preservation in which it was found may probably be attributed to the entire exclusion of external air. The shroud was perfect, and a branch of laurel on the breast of the corpse was, though faded, entire. The body was permitted to remain for some time uninterred, but was eventually placed in the vaults of Christ church, Birmingham, where it now remains. Mr. Knott of Birmingham has a portrait of Baskerville in his possession, from which an engraving has been made for Hansard's 'Typographia;' and a fine portrait of Baskerville by Gainsborough is in the possession of Messrs. Longman, the publishers of Paternoster-row.

(Hansard, *Typographia*; Dibdin, *Introduction to the Classics; Notes and Queries*, vol. iv., v., and viii.)

BASNAGE. Few families have produced so many individuals of literary distinction and moral worth as the family of Basnage. Many of its members were zealous and able supporters of Protestantism in France.

1. NICHOLAS BASNAGE, who lived in the middle and latter half of the 16th century, being compelled to leave France on account of his

adherence to the reformed religion, fled to England, and became the minister of a congregation at Norwich. He afterwards returned to France, and became pastor of a reformed church at Carentan.

2. BENJAMIN BASNAGE, the son of Nicholas, born in 1580, was, during fifty-one years, pastor of the church which his father had held at Carentan. Benjamin Basnage was successively a provincial deputy of the Protestant churches in Normandy, and head of the assembly held at Rochelle in 1622. He also signed the project of defence under the title of 'Modérateur Ajoint,' and went to England to solicit aid. The expectations which the French Protestants had entertained of help from James I. not being realised, Basnage proceeded to Scotland to gain the interest of his private friends in that country. On the termination of active hostilities against the Protestants, Basnage returned to France, and was appointed deputy for Normandy in the national synod which was held at Charenton in 1623. The vigour and zeal with which he maintained the interests of the reformed religion rendered him an object of increasing suspicion to the court. The king, by a decree, forbade him to exercise the ministerial functions, and refused him permission to appear as a deputy, and to take a part in the synod held at Charenton in 1631. This synod commenced its session by remonstrances against this decree, which were so forcibly expressed, that the court yielded, and Basnage was admitted to the synod, in the deliberations of which assembly he exercised great influence. He was elected president of the national synod held at Alençon in 1637. Benjamin Basnage died in 1652. His principal work, a treatise on the church ('*Traité de l'Eglise*'), was printed at Rochelle, 1612. He left imperfect a work against the worship of the Virgin.

3. ANTOINE BASNAGE, the eldest son of Benjamin, was born in 1610. He adopted the profession of his father, and was minister at Bayeux. During the renewed persecutions of the Protestants he was, at the age of sixty-five, placed in the prison of Havre de Grace; but his firmness remained unshaken. After the revocation of the edict of Nantes, he escaped to Holland in 1685, and died in 1691 at Zutphen, in which place he had held a pastoral charge.

4. SAMUEL BASNAGE de Flottemanville, son of Antoine, was born at Bayeux in 1638. He preached at first in his native place, but escaped with his father to Holland in 1685. He died a preacher at Zutphen in 1721. The principal works of Samuel Basnage were—'*L'Histoire de la Religion des Eglises Reformées*,' Rotterdam, 1690, 2 vols. folio, republished in 1699; '*De Rebus Sacris et Ecclesiasticis exercitationes Historico-critice, in quibus Cardinalis Baronii Annales ab an. XXXV. in quo Casaubonus desitit expenduntur*,' Traject. 1692, 1717, 4to; '*Annales Politico-Ecclesiastici annorum DCXLV. a Cesare Augusto ad Phocam usque in quibus res imperii ecclesiæque observatu digniores subjunctur oculis erroneeque evelluntur Baronio*,' Rotterdam, 1706, 3 vols. folio.

5. HENRI BASNAGE du Franquenay, the youngest son of Benjamin Basnage, was born on the 16th of October 1615, at St. Mère Eglise, in Lower Normandy. He studied for the bar, and became one of the most able and eloquent advocates in the parliament of Rouen, where he took the oath in 1636. In nearly all the more important causes he was either retained or consulted. His learning was immense and his integrity unsullied. He died in 1695, and left three sons, two of whom will be subsequently noticed; the third, who was in the service of the States-General, died in 1732. His daughter, Magdalen, married, in 1682, M. Paul Baldry, or Baudri, who leaving France after the revocation of the edict of Nantes, was made professor of ecclesiastical history at Utrecht. Henri Basnage's works are, '*Coutumes du Pays et Duché de Normandie, avec commentaires*,' 2 vols. fol., 1678, 1681, 1694; '*Traité des Hypothèques*,' 1687, 1724, 4to. The complete works of Basnage were published in 2 vols. fol., Rouen, 1776.

6. JACQUES BASNAGE de Beauval, the eldest son of Henri, born at Rouen, 8th of August 1653, was the most celebrated member of his family. He was sent when very young to Saumur, to study under the famous Tannequin, or Tannequi, or Tanaquil le Févre, and became the favourite pupil of his master. At the age of seventeen he went to Geneva, already well read in the best Greek and Latin authors, and acquainted with the Spanish, Italian, and English languages. At Geneva, and afterwards at Sedan, he studied theology; and on his return to Rouen he was received into the ministry, September 1676, at the age of twenty-three, and became pastor of the reformed church in that city. He married, in 1684, Anne du Moulin, daughter of Cyrus du Moulin, and grand-daughter of Peter du Moulin.

The church at Rouen being closed by authority in June 1685, Basnage obtained permission from the king to retire to Holland. He settled at Rotterdam, in which place he was a stipendiary minister, until, in 1691, the consistory, influenced by Heinsius, appointed him pastor of a church at the Hague. Here he not only exerted himself in his religious duties with indefatigable zeal, but was also employed in state affairs. He was the medium of a secret negotiation carried on by Maréchal d'Uxelles, plenipotentiary of the French king at the congress of Utrecht, and acquitted himself in this affair with so much ability, that he was afterwards employed in several important commissions. His services at length procured for Basnage the restitution of all his former possessions in France.

Basnage was the personal friend of the Grand Pensionary Heinsius,

and while in Rotterdam had a weekly meeting with Pæts, Bayle, and other scholars. He carried on a correspondence with several princes, noblemen, and ministers of state, and with many scholars in France, England, Germany, and Italy. He was scarcely less esteemed by Catholics than by Protestants. Voltaire said that Basnage was fitter to be a minister of state than of a parish. His health, which till the year 1722 had been remarkably good, then began to decline. He died on the 22nd of September 1723, in his seventy-first year. He left only a daughter, who was married to M. de la Sarraz, minister of war to the King of Poland.

The following are some of his principal works; a complete list would be very long:—'*Examen des Méthodes proposées par Messieurs de l'Assemblée du Clergé de France en 1682*,' Cologne, 1684, 12mo. This work was the foundation of his subsequent reputation. It is well written, but he never affixed his name to it.—'*Réponse à M. l'Evêque de Meaux, sur sa Lettre Pastorale*,' Cologne, 1686, 12mo. This work is against the Pastoral Letter of Bossuet, addressed to the new Catholics; '*Dissertationes Historico-Theologicæ*,' Rotterdam, 1694, 8vo; '*La Communion Sainte, ou Traité sur la nécessité et les moyens de communier dignement*,' Rotterdam, 1688, 12mo. The fifth edition is very much enlarged, and contains a third and fourth book on the conduct of communicants before and after communion, printed at Rotterdam in 1697, in 12mo. There have been several editions of this work, which has been so much admired, even by Roman Catholics, that it has been printed for them at Rouen and Brussels.—'*Histoire de la Religion des Eglises Réformées, &c., pour servir de réponse à l'Histoire des Variations des Eglises Protestantes, par M. de Meaux*,' Rotterdam, 1690, 8vo, 2 vols.: again in 1721, 2 vols. 8vo, and in 1725, 2 vols. 4to; the last edition very much enlarged. This work has been since joined to the History of the Church.—'*Traité de la Conscience, dans lequel on examine sa nature, ses illusions, ses craintes, ses doutes, ses scrupules, sa paix, et divers cas de conscience, avec des Réflexions sur le Commentaire Philosophique*,' Amsterdam, 1696, 2 vols. 8vo. Two editions of this work have been printed at Lyon in 3 vols. 12mo.—'*Histoire de l'Eglise depuis Jésus Christ jusques à présent*,' Rotterdam, 1699, 2 vols. folio.—'*Histoire des Juifs depuis Jésus Christ jusques à présent, pour servir de Supplément à l'Histoire de Joseph*,' Rotterdam, 1706, 5 vols. 12mo.; a new and enlarged edition at the Hague in 1716, 15 vols. 12mo.; translated into English by Thomas Taylor, 1708, fol.—'*Histoire des Juifs, réclamée et rétablie par son véritable auteur M. Basnage, contre l'édition anonyme et tronquée qui s'en est faite à Paris, chez Roulland, 1710, avec plusieurs additions pour servir de sixième tome à cette Histoire*,' Rotterdam, 1711, 12mo. He attacks M. du Pin, who had printed it at Paris, after having changed what he thought proper, without mentioning the author.—'*Annales des Provinces Unies depuis les Négociations pour la Paix de Münster, avec la Description Historique de leur Gouvernement*,' this work, which begins in 1646, carries the annals down to 1684, and Basnage left a plan for conducting it till 1720.—'*Dissertation Historique sur les Duels et les Ordres de Chevalerie*,' Amsterdam, 1720, 8vo. This is a curious work. He also furnished many pieces to his brother, M. Basnage de Beauval, for his '*Histoire des Ouvrages des Savans*.'

7. HENRI BASNAGE DE BEAUVAL, the younger son of Henri Basnage de Franquenay, and brother of Jacques Basnage, born at Rouen, August 7, 1656, followed the profession of his father. On the revocation of the Edict of Nantes in 1687, he took refuge in Holland, and died there, March 29, 1710, aged 54 years. He wrote a '*Traité de la Tolérance des Religions*,' 1684, 12mo; and edited '*L'Histoire des Ouvrages des Savans*,' a widely-circulated journal, which was commenced in September 1687, as a continuation of Bayle's '*Nouvelles de la République des Lettres*,' and terminated in June 1709: it consists of 24 vols., 12mo. Basnage published in 1701 an improved edition of Furetière's '*Dictionary*,' the '*Dictionnaire de Trevoux*' (1704) is only a reprint of this work, without mention of the name of either Furetière or Basnage.

BASSANO, GIACOMO DA PONTE, was born at Bassano in 1510. He was instructed in the elementary principles of painting by his father, Francesco da Ponte, and was afterwards sent to Venice, where he studied under Bonifazio. In a city which abounded with the works of Titian, Parmegiano, and Tintoret, Bassano stood in little need of a particular master; he applied himself with intense assiduity to the general study of those great artists, and, in all that relates to mechanical practice, with extraordinary success; nor are evidences wanting that even in grandeur of style and conception he exhibited at that time a capacity which none who judge him by his later works would suppose him to have possessed. He painted, in front of the Casa Michelli, a fresco representing Sampson destroying the Philistines, parts of which, especially the figure of the hero himself, approximate to the grandeur of Michel Angelo. In the pictures of a Nativity and the Flight into Egypt (the latter for the church of St. Girolamo), he emulated the style of Titian with equal success. But from the time he left Venice his style deteriorated. He no longer even aimed to attain the sober grandeur of the painters under whom he had studied. However lofty the subject, he represented it with a coarse familiarity, often most discordant with the theme.

On the death of his father he returned to Bassano and took possession of his paternal residence, situated on the picturesque banks of the

Brenta. He resided here during the remainder of his life; and his style of landscape, drawn from the scenery which surrounded him, gives something of grandeur even to his least successful performances; his horizons are usually high, and terminate in a range of blue mountains, illuminated by the rising or setting sun. With little power of selection, Bassano had surprising facility in representing whatever he saw. He delighted in rural subjects and their accompaniments, and such was his fondness for painting cattle that he sometimes introduced them without the least attention to propriety. Exteriors and interiors of country-inns were also favourite subjects with Bassano: these he often makes the site for some historical or scriptural subject, but the principal characters are always made subordinate; groups of peasants, the hostess, or the cook, busy among her kitchen utensils, domestic animals, or still life, occupy the prominent places. Little however is lost by this want of subordination, nor is any wish excited to see the superior actors brought more forward; for Bassano, as Sir Joshua Reynolds observes, "painted the boors of the district of Bassano, and called them patriarchs and prophets." His animals however are touched with admirable truth and discrimination; and in spite of all his defects, such is the spirit, clearness, and decision of his touch, the depth and richness of his tones, and the general picturesqueness of his effects, that his works not only command the respect of contemporary artists, but have been always valued by judges of painting for qualities so important in the art. Bassano painted with extraordinary dispatch, and such of his works as were not commissioned were sent for sale to the neighbouring towns of Vicenza, Brescia, Treviso, and Padua, where they found ready purchasers. His fame rose so high that he was invited by the emperor Rudolph II. to settle at his court; but Bassano's attachment to his established habits of life induced him to decline this proposal. He painted for that monarch pictures of the twelve months and the four seasons of the year. Bassano occasionally painted portraits, and several of the most distinguished persons in Venice sat to him during his residence in that city—among them, Sebastiano Venezio, the doge, Tasso, and Ariosto.

In a few instances during his latter practice Bassano showed that the feeling for grand design which he had manifested in his youth was not quite extinguished. His altar-pieces of the Entombing of Christ, in the church of Santa Maria in Vanzo, at Padua; St. Roche interceding with the Virgin for the People infected with the Plague, at Vicenza; and the picture of the Seizure of Christ in the Garden—are distinguished not only by a sublimity in the general effect, but by a grandeur in the character of the figures, resembling the style of the Roman school. Bassano died in February 1592. There is a prodigious number of his pictures in the palaces of Rome and Venice, and they are frequently seen in English collections. There are many engravings from his works.

FRANCESCO DA PONTE, was the son of the preceding, and a painter of considerable merit. Giacomo Da Ponte had four sons who followed his profession. Francesco, the eldest, born in 1548, is called the 'younger Bassano'; he studied with his father and practised in Venice, where he obtained considerable reputation by various altar-pieces, one in particular of St. Apollonia, in the church of Santa Afra, at Brescia. His most distinguished performances were a series of pictures painted for the ducal palace at Venice, commemorative of the leading events in the history of the republic. Francesco threw himself from a window in a fit of delirium, and died on the spot, in 1591.

GIOVANNI DA PONTE was the second son of Giacomo, and born in 1553. He is chiefly known as a copyist of his father's works, which he imitated with such accuracy, that his copies are scarcely distinguishable from the originals: he died in 1613.

LEANDRO DA PONTE, the third son of Giacomo, was born in 1558. He distinguished himself as a portrait-painter, and was knighted by the Doge Grimani, who sat to him. He occasionally painted historical and sacred subjects; among the best are the Birth of the Virgin and the Resuscitation of Lazarus, the former in the church of Santa Sophia, the latter in that of La Carità, at Venice. Leandro died in 1623.

GIROLAMO DA PONTE was the youngest son of Giacomo, born in 1560. He was much employed by his father in copying, but contributed an original performance, an altar-piece of great merit, of St. Barbara and the Virgin, to the church of San Giovanni at Bassano: he died in 1622. The same style predominates in the works of all the Bassanos, which exhibit, with the exception of a few pictures, much more of the manual than the mental capacity of art.

BASSANTIN, or BASSINTOUN, JAMES, was the son of a Scotch laird of that ilk (no doubt Bassendean in Berwickshire). James was educated at Glasgow, and afterwards travelled in the Netherlands, Switzerland, Italy, and Germany. He finally settled at Paris, where he taught mathematics and astronomy, and acquired considerable reputation and some fortune. Of his personal life we know little but that he was addicted to astrology, returned to Scotland in 1562, and adhered to the party of the Earl of Murray against Mary, and died 1568. He wrote various works on mathematics, astronomy, and arithmetic, some of which are now only known by the titles which have been recorded. One of the works which was best known was a 'Discours Astronomique,' Lyon, 1557, which appears to have been translated into Latin by De Tournes (Tornesius), under the title of 'Astronomia J. Bassantini, Scoti,' Geneva, 1559, reprinted, 1613. His

planetary system is that of Ptolemaeus. (Delambre, *Histoire de l'Astronomie Moderne*.)

BASSOMPIERRE, FRANÇOIS DE, Marshal of France, and Captain-General of the Swiss Guards, was born in Lorraine on the 12th of February 1579. His education was, all things considered, excellent for the times in which he lived. Bassompierre tells us, for example, in his memoirs, among other particulars of his studies, that in his seventeenth year he devoted one hour a day singly to the study "of law, of casuistry, of Hippocrates, the ethics and politics of Aristotle," and that, like our own Lord Herbert of Cherbury, whom he resembled in his admiration of the usages of chivalry, he prided himself on his early proficiency in martial exercises, particularly "riding the great horse."

In 1598 Bassompierre, having first visited Italy and Germany, arrived at Paris. He was first introduced to the French king's notice in a ballet, which some young courtiers had got up to amuse Henry on his recovering from an illness, in which the illness, and still more the mode of cure, were held up to laughter. Bassompierre took a part in the ballet, and quickly caught the attention of Henry. The result was a warm friendship on both sides; and Bassompierre became for life a devoted Frenchman.

The incidents of Bassompierre's career are only interesting to the general reader so far as they illustrate the manners of the times. Bassompierre was young, ardent, and accomplished, and distinguished for his personal beauty and courage; and the court of France was at that time one scene of gaiety, intrigue, and licentiousness. In 1609 Bassompierre was on the point of being married to the most beautiful woman in France, the daughter of the Constable de Montmorency. He was preferred among a host of suitors by Mademoiselle de Montmorency herself, and had obtained the consent of her father and the king, who had not then seen the lady. The match was however broken off, because the king fell in love with the lady—informed Bassompierre of the fact, and induced him to forego the marriage. Bassompierre served in all the civil wars, mostly of a religious character, in which France was engaged in his time, and rose through successive steps to the highest military honours, having been appointed by Henry captain-general of the Swiss Guards, a high court appointment, and promoted to the rank of marshal in the next reign. He assisted at the siege of Rochelle, under the eye of Cardinal Richelieu, and is reported to have said on that occasion, "We shall be fools enough to take the place for the cardinal," meaning that the capture of that last fortress of the Huguenots would so strengthen the hands of Richelieu as to place the party of the queen-mother and the Guises at his mercy; and the result proved that Bassompierre was right.

Bassompierre stood so high in the favour of the indolent monarch, Louis XIII., as to convert the favourite Luynes into a fierce enemy. After an explanation between them, Bassompierre accepted the offer of an embassy, and Luynes declared himself his devoted friend. He was accordingly sent ambassador extraordinary to Spain, and afterwards to the Swiss, in the years 1624-25. The particulars of these embassies are detailed in his 'Ambassades' and his 'Mémoires,' but do not possess general interest. In 1626 he was sent to England, at the instance of the Cardinal Richelieu, in order to enforce the observance of the treaty of marriage between Henrietta Maria and Charles I., so far as it applied to the toleration of the Roman Catholic worship, in which he displayed dexterity and boldness, but had no great success.

The remainder of Bassompierre's career is soon told. He attached himself to the interests of the house of Guise, and the queen-mother Mary de Medicis, who was the great obstacle to Richelieu's attaining absolute power, and he paid the penalty of his adhesion. The immediate cause of his incurring the cardinal's displeasure was, as he tells us in his 'Mémoires,' his neglecting to keep an appointment to dinner. On the day preceding the memorable Day of the Dupes (la Journée des Dupes), the 30th of November 1630, Bassompierre met the cardinal in one of the passages of the Louvre. He accosted him, and Richelieu feigned to receive the courtesy as a favour to a 'poor disgraced minister.' Bassompierre, in the fulness of his benevolence, condescended to invite himself to dine with the cardinal, and the offer was accepted. It happened however unfortunately that two noblemen, enemies of the cardinal, met Bassompierre in the course of the day, and 'debauched' him to dine with them, and the 'poor disgraced minister' was forgotten.

On the 23rd of February 1631, Bassompierre was arrested, by Richelieu's orders, and sent to the Bastille, where he was confined for twelve years; that is till the death of the cardinal. He tells us, that the day before he was arrested he burned upwards of 6000 loveletters which he had received at different times from his female admirers—a pretty decisive proof of the reputation which induced Madame de Montpensier, when recalling the brilliant visions of her youth, to designate him as "cet illustre Bassompierre."

(Preface to the translation of 'Bassompierre's English Embassy, ascribed on personal knowledge by Mr. D'Israeli to the Right Hon J. W. Croker.)

He employed his time during his imprisonment in writing his 'Memoires,' and revising his 'Ambassades;' but both are so very dull and jejune, that we cannot help regarding him as one of those men whose fame has been mainly owing to the advantages of a good person

and address. Bassompierre died of apoplexy on the 12th of April, 1646, three years after his liberation from prison. It is alleged that he was offered the guardianship of the young monarch Louis XIV., but age, or, as Mr. Croker conjectures, the 'wholesome discipline of the Bastille,' had cured him of all ambition as a courtier, and he declined the perilous honour.

BAST, FREDERICK JAMES, a scholar of considerable eminence, was born in the state of Hesse-Darmstadt about the year 1772. He received his earliest instruction from his father at Bouxviller, but afterwards studied in the university of Jena, under Professors Griesbach and Schütz.

His first literary essay was a commentary upon Plato's 'Symposion,' which was followed in 1796 by a specimen of an intended new edition of the 'Letters' of Aristænetus. He lived at this time at Vienna, where, in the Imperial Library, he had found a manuscript of Aristænetus, which afforded most important readings for improving the text of that author.

The landgrave of Hesse-Darmstadt afterwards made him secretary of legation at the congress of Radstadt; and finally placed him in the same capacity with the Baron de Pappenheim, his minister at Paris. Bast united the labours of philology with those of diplomacy, and profited very much during his stay in Paris by the collation and copying of a considerable number of Greek manuscripts. It was a most advantageous residence for him, as the best classical treasures of the Vatican had at that time been recently transported to France.

Of the importance of his critical researches some estimate may be formed from his 'Lettre Critique à M. J. F. Boissonade, sur Antoninus Liberalis, Parthenius, et Aristénete,' 8vo, Paris, 1805. This work, of rather more than 250 pages, stands in the first rank of treatises on verbal criticism. It was in a volume of the Vatican, No. 393 of the Greek manuscripts, which had once belonged to the electoral library at Heidelberg, that he found the manuscripts of Antoninus Liberalis and Parthenius; and the same volume contained seventeen other manuscripts, some of them inedited; of each of which, in the 'Letter to M. Boissonade,' Bast has given a notice.

Schæfer's edition of Gregorius of Corinth, and some other grammarians, published at Leipzig, 2 vols. 8vo, 1811, contains Bast's Notes on that author, with a Palaographical Dissertation (accompanied by seven plates of fac-similes from Greek manuscripts), which is considered to be a master-piece of erudition.

Bast died of apoplexy at Paris, November 15, 1811. His Notes upon Aristænetus were published in a variorum edition of that author by his friend M. J. F. Boissonade, 8vo, Lutetiae, 1822.

BASTIAT, FREDERIC, was born at Bayonne, June 29, 1801, the son of a merchant, by whom he was early destined to a commercial career. After receiving a good education at the college of St. Sever, he was placed in the counting-house of an uncle at Bayonne. Here he applied himself sedulously to the study of the principles of trade; and, having to visit Spain and Portugal on business in 1840, he availed himself of the opportunity of studying the commercial regulations of these two countries, lagging behind even those of France at that time. The result of his thoughts was at length communicated to the public by M. Bastiat in 1844. It appeared in the 'Journal des Economistes,' under the title 'L'Influence des Tarifs Français et Anglais sur l'Avenir des deux Peuples.' In this the author avowed himself as the adversary of the principle of protection to trade—a principle at that time universally acted upon in France, and almost as universally recognised as just and expedient. Bastiat however gained adherents, and time and truth, with the example of England, carried his principles forward till they were to some extent acknowledged and adopted by the government of France, and appear likely to be extended still further. In 1845, after a visit to England, where he had made the acquaintance of Mr. Cobden, he translated, under the following title, many of the addresses of the Free-Traders, preceding them by an introduction:—'Cobden and the League; or the English Agitation for the Freedom of Exchange.' In this he adduced all the inconveniences of a prohibitive system. He became secretary in Paris of a society for promoting the freedom of trade, and editor of a journal devoted to the same cause. While thus advocating sound commercial principles, he was opposed to the doctrines of Socialism, and the pretended right of every one to be supplied with work. After the revolution of 1848 he sat for some time in the Legislative Assembly, but his health failing, he proceeded to Italy in hopes of improving it, and died at Rome, December 24, 1850.

M. Bastiat wrote many works besides those mentioned, but all on the same leading subject. Though valuable and novel in France at the time of their appearance, they contain little that had not been before enunciated in England; but the views, although not original, are placed effectively before the reader.

(*Nouvelle Biographie Universelle*.)

BATHORI is the name of a noble family in Transylvania, of whom several have been its princes. The family was originally from Germany, and settled in Transylvania about the middle of the 14th century. In 1571 STEPHEN BATHORI was elected Prince of Transylvania, and confirmed in his dignity by the Sultan Selim and by the Emperor Maximilian. In 1576 he was also elected King of Poland, after Henry of Valois had succeeded to the throne of France. Bathori married the heiress of the Jagellons, and died in 1586, after having defeated the

Russians in many battles, recovered Lithuania from them, and established many useful institutions in Poland.

CHRISTOPHER BATHORI was chosen Prince of Transylvania after his brother Stephen had obtained the crown of Poland. He however died before him, in 1581; and was succeeded by

SIGISMOND BATHORI, his son. This prince had been educated by the Jesuits, whom his father had introduced into Transylvania, and their influence produced first a rupture with Turkey and next an insurrection, which was extinguished in blood. Sigismond married a princess of the house of Habsburg, and agreed with the Emperor Rodolph that, in case of his dying without heirs, Transylvania should be united to Austria. Shortly after this marriage he was induced to abdicate in favour of Rodolph, and to take orders; and in 1588 he surrendered his country to the Austrian authorities, having been promised the dignity of a cardinal. He waited in vain for the promised advancement, and at length returned to Transylvania. The inhabitants ejected the Austrians, and in 1601 Sigismond was restored. It was but for a short time: Austria, with the assistance of Michael, the vojvode of Wallachia, having defeated him in battle, he again consented to abdicate for a pension and the estate of Lobkowitz. After thus selling his country, to the government of which he had been elected only, Sigismond died at Prague, March 27, 1613.

BATHURST, ALLEN (Earl Bathurst), eldest son of Sir Benjamin Bathurst, governor of the East India Company in the years 1688-9, and treasurer of the household to the Princess Anne of Denmark, was born at Westminster in November 1684. In 1699 Allen Bathurst was entered at Trinity College, Cambridge, of which his uncle, Dean Bathurst, was then master; and six years after commenced his political life as representative for the borough of Cirencester. As a member of the legislature he actively promoted the union of the two kingdoms, and concurred in the opposition to the Duke of Marlborough and his adherents, of which Harley and St. John were the leaders. On the dismissal of the Whig ministry, he accepted of no office from their Tory successors; but was in 1711 made a peer of Great Britain by the title of Lord Bathurst. In the upper house he opposed, in 1716, as a violation of the constitution, the Septennial Bill. He distinguished himself in 1723 as a zealous defender of Bishop Atterbury, when the bill for "inflicting pains and penalties" on that prelate was discussed in the House of Lords. In 1727 he opposed a war with Spain, which then threatened the country; and in 1731 supported the bill to prevent pensioners from sitting in the House of Commons. On other occasions also of public interest, and during the whole period of which this narration is a brief review, he showed himself a steady opponent of Sir Robert Walpole's administration.

Lord Bathurst was made in 1742 captain of his majesty's Band of Gentlemen Pensioners, which post he resigned in 1744. He was appointed treasurer to George III., then Prince George of Wales, in 1757, and this office he held till the death of George II., in 1760, when he declined the acceptance of any further employment, on account of his age. In consideration however of his previous services, he received a pension of 2000*l.* per annum on the Irish establishment, and was advanced to an earldom in 1772. He died at his seat near Cirencester on the 16th September 1775, aged ninety-one.

In his private character Lord Bathurst was generous and affable; that he possessed knowledge and acquisitions as a man of letters may be inferred from his long and intimate acquaintance with Pope, Swift, Prior, Rowe, Congreve, Arbuthnot, Gay, and Addison; and the sincerity of his political friendships was manifested in his firm and strenuous opposition to the attainder of Bolingbroke and Ormond. Mr. Pope acknowledged his obligations by dedicating to Lord Bathurst the third epistle of his 'Moral Essays,' in which he pays a happy compliment to his judgment and integrity.

The only surviving son of Lord Bathurst, Henry, the second earl, born in 1714, was made Chief Justice of the Common Pleas in 1754, and in 1771 was appointed Lord Chancellor with the title of Baron Apsley. He resigned the seals in 1778, and died in 1794. He was the author of a pamphlet in 4to, entitled 'The Case of Miss Swordfeger,' and of a work on the 'Theory of Evidence,' 8vo.

*BATHYANI, COUNT CASIMIR, was born June 4, 1807, of a noble Hungarian family. After completing his studies Count Casimir made the tour of Europe, and remained a considerable time in England. This residence probably had its effect in inducing him to rank himself on the liberal side on his return to Hungary, and to this party he remained firmly attached during the diets of 1840, 1843, and 1844. In 1848 he took an active part in the war. He commanded the forces occupying Essek, which controlled the navigation of the Danube and the Drave. When Essek was surrendered to the Austrians in February 1849, he took refuge in Debreczin. He was next named governor of Szegedin, of Theresiopol, and of Zombor. In April 1849, upon the declaration of independence by Hungary, Count Casimir was nominated minister for foreign affairs. He followed Kossuth in his retreat to Arpad, and protested strongly against the authority given to Görgey without his knowledge. After the surrender at Vilagos he reached Widdin, was confined at Kutayah with the other refugees, until released in 1851, when he retired to Paris. (*Nouvelle Biographie Universelle*.)

BATHYANI, COUNT LOUIS, was born at Presburg in 1809, of a branch of the family to which Count Casimir belonged. At the age

of sixteen he entered the Austrian army as a cadet, and was stationed at Venice. He subsequently travelled in the East and in Europe with his wife, the Countess Antonia Zichy. On his return to his native country, he became at once a leader on the liberal side, a distinguished orator, and a favourite with the public. From 1840 to 1844 he opposed openly the Austrian chancellor Appony, in favour of Hungarian commerce and industry. At this time he was alike opposed to Kosuth, with whom however he afterwards allied himself. When, in consequence of the events of March 1848, the Archduke Stephen was created Palatine of Hungary, Count Louis, an old friend of Stephen's, was named chief minister. He strove earnestly in this party to maintain the political union between Austria and Hungary. After the invasion of Jellachich, and some fruitless negotiations with Austria, he resigned his functions on September 11; the next day he was commissioned to form a new ministry, but this effort failed.

After the dissolution of the Diet, and the murder of Count Lambert, he repaired to Vienna to endeavour to prevent the ill-effects of this crime; and if possible to form a new administration. His exertions were in vain, and he returned to take a part in the hostile struggle now become inevitable. In November 1848 he went to Pesth, to take his seat in the Diet, and was named one of a deputation sent to treat with General Windischgratz, the Austrian general, who was approaching Pesth with an army. The deputation was not received. The Hungarian government removed to Debreczin, but Count Louis remained at Pesth, where, on the arrival of Windischgratz on January 8, 1849, he was arrested. After being transferred to Ofen, to Olmutz, and to Laybach, he was at length brought back to Pesth, where he was condemned by a council of war to be hung. He endeavoured to escape the ignominy of the sentence by destroying himself with a poignard. He did not succeed, but at length the sentence was changed, and he was shot on October 6, 1849. His estates were confiscated, and his wife and children were exiled.

BATHYCLES, a celebrated ancient statuary or sculptor, of Magnesia on the Mæander in Lydia. Though his time is uncertain, several scholars have attempted to establish it, but without success: Thierch, substantially agreeing with Heyne, places Bathycles in the 29th Olympiad, contemporary with Archilochus. This was at the close of the second Messenian war; De Quincy, Winckelmann, Welcker, Böttiger, Sillig, and Voss adopt the more generally received opinion that he flourished about the time of Solon, or somewhat later. Bathycles was the artist who made the colossal throne of the Amyclidean Apollo at Amyclæ near Sparta. On the top of the throne Bathycles represented himself and his assistants. Quatremère de Quincy, in his 'Jupiter Olympien,' has given a view of the god and his throne, designed from the description of Pausanias. The Bathycles who left a cup for the wisest man was a different person; he was of Arcadia, and lived certainly in the time of Solon, but it does not follow that he was an artist because he made a bequest of a cup.

BATO'NI, POMPE'O GIRO'LAMO, one of the most distinguished painters of the 18th century, was born at Lucca in 1708. His father was a goldsmith, and Pompeo had thus an early opportunity of displaying his ability for design. He established himself early in Rome, where he studied Raphael and the antique. In a few years he obtained the first name in Rome, and lived there until his death, for forty years, without a rival, with the exception of Menga. He died February 4, 1786.

Batoni was equally excellent in portrait and history. His historical works are chiefly scriptural and from the lives of the saints; he painted also many single pictures of saints of both sexes. His portraits, which are admirably modelled, are extremely numerous, and among them are many of the highest personages in Europe. He painted three popes—Benedict XIV., Clement XIII., and Pius VI.; also the emperors Joseph II. and Leopold II. of Austria, the emperor Paul of Russia, and many others of inferior rank. He excelled in drawing, in tone, and in colour; his execution was often very elaborate; but in composition he was considered inferior to Menga, though equal to him in expression.

Several cities of Italy possess altar-pieces by Batoni, and there are many of his works in Germany and other foreign countries; some of his best works are at Lisbon and at St. Petersburg. His principal work at Rome is the Fall of Simon Magus, now in the church of Santa Maria degli Angeli. Batoni was a Cavaliere and a Knight of the order of Maria Theresa.

BA'TRACHUS, an architect and sculptor of Laconia, who lived in the time of Augustus. Pliny ('Nat. Hist.,' xxxvi. 4, 11) tells a story of Batrachus and his fellow-countryman Saurus. He says:—Being very rich, they built at their own cost two temples to Jupiter and Juno at Rome, inclosed by the porticoes of Octavia, hoping for an inscription; but this being refused them, they introduced their names in another manner, by carving a lizard (Saurus) and a frog (Batrachus) in the centre of the Ionic volutes of the columns, one in each volute. There is still at Rome, in the church of San Lorenzo, a column with an Ionic capital of this description, in which the reptiles are well executed. The story is improbable, and perhaps originated in the peculiar nature of the ornaments; or the architects derived their names from the reptiles, rather than the reptiles their images from the names of the architects.

BAUHIN, the names of two distinguished men, the sons of John Bauhin, a physician of considerable celebrity, who, after practising in England, the Netherlands, and France, was forced, on account of his having embraced the creed of Calvin, to take refuge at Basle, in Switzerland.

JOHN BAUHIN, his eldest son, was born at Basle in 1541. His father, having destined him for the medical profession, placed him, towards the completion of his studies, with Fuchsius, a botanist of considerable eminence in his day, and afterwards with the celebrated Conrad Gesner, whom he accompanied in his various excursions through Switzerland. He subsequently visited several other parts of Europe for the purpose of becoming acquainted with their vegetable productions, and with a view to collecting materials for his 'Historia Plantarum,' afterwards published. In 1566 he fixed himself at Basle, where he was elected professor of rhetoric. A few years subsequently he was appointed principal physician to the Duke of Würtemberg, in which situation he died at Montbelliard in 1613. During his life he published little of importance, but he occupied himself with great industry in reducing the scattered knowledge of the botanists of his day into a single and connected history of the whole vegetable kingdom, which he arranged upon the plan sketched out by Lovel. This work was not printed till nearly forty years after his death, in 3 vols. folio, published at Yverdon in 1650-51, under the care of Dr. Chatré, his brother-in-law. Although by no means free from errors, this work was a most important performance for the time when it appeared, and may be considered the first step towards reducing systematical botany into order.

GASPARD BAUHIN, the younger son, was born at Basle, January 17, 1560. After receiving the usual college education he visited several parts of Europe, with a view to examine their vegetable productions, and to render himself conversant with the state of medical science. On his return to Basle he appears to have gained great reputation as a learned man and a skilful naturalist. We find him described as holding the offices of professor of Greek, of anatomy and botany, and of the practice of medicine, dean of the faculty of medicine, chief physician to the town, and rector of the university. He died at Basle December 5, 1624. His works consist of several medical treatises, and especially of a set of anatomical plates, partly original and partly copied from Vesalius and Eustachius; but his reputation chiefly depends upon his botanical publications. His chief works were—'Phytopinax,' Basle, 4to, 1596, and 'Prodromus Theatri Botanici,' Frankfurt, 1620; and partly of collections of the synonyms of the botanical writers who had preceded him. The latter appeared in his 'Pinax Theatri Botanici' in 1623, of which a second edition was published in 1671, and which is a complete key to the botanical knowledge of the day.

BAUMÉ, ANTOINE, was born at Senlis, in the department of Oise, in France, on February 26, 1728. The son of an innkeeper, he experienced numerous difficulties in obtaining instruction, all of which his arduous for the acquisition of knowledge overcame. In 1752, on his examination at the Pharmaceutical College at Paris, he acquitted himself so satisfactorily, that very shortly afterwards he was appointed professor of chemistry to that institution. Here he soon distinguished himself by the lucid clearness of method that characterises all his works, although his use of the ancient nomenclature imposes a needless labour on the student, and obscures a treasure of facts and observations. Baumé was not only an excellent professor, but a successful manufacturer. He carried into operation the scientific details of which Lavoisier and Scheele had sketched the bases. He established a manufactory for sal-ammonia, which France had previously imported from Egypt; for muriate of tin, acetate of lead, and the mercurial salts. He also made improvements in the manufacture of porcelain, in the scarlet dye for the Gobelins tapestry, and in the areometer. He invented processes for gilding the works of watches, for dyeing cloths of two colours, for blanching the yellow raw silk, for purifying saltpetre, and for removing the bitter principle from the flour of the horse-chestnut. In 1773 he was elected a member of the Académie des Sciences, a just reward for his many contributions to the useful arts. In 1780, having acquired a competent fortune, he retired from business in order to devote himself wholly to science. In a few years however the revolution broke out, and his property was lost. Baumé, though now an aged man, sustained the deprivation with firmness. He again commenced manufacturer, and died October 15, 1804.

Among his numerous works, the most important are 'Plan d'un Cours de Chimie expérimentale et raisonnée,' 1767; 'Manuel de Chimie, ou Exposé des Opérations et des Produits d'un Cours de Chimie,' 1763, this has been translated into English; 'Elements de Pharmacie théorique et pratique,' first published in 1762, and other editions in 1769, 1773, and in 1818; and 'Opuscules de Chimie,' 1798. He also wrote many valuable articles in various scientific journals, particularly in the 'Dictionnaire des Arts et Métiers,' a work which he himself had projected.

(*Nouvelle Biographie Universelle*.)

BAUMGARTEN, ALEXANDER GOTTLIEB, was born June 17, 1714, at Berlin, where his father was preacher to the court of Prussia. He studied at Halle, and became a warm admirer of Wolf's philosophy, though it was at that time considered heretical, and Wolf himself had in consequence been obliged to leave Halle. Baumgarten applied himself to the study of logic and of belles-lettres, on which he afterwards gave lectures at the Orphan Institution of Halle. Having

examined what had been taught till then under the name of belles-lettres, he endeavoured to reduce that branch of study to fixed principles. He invented the word 'æsthetic,' which he applied to the theory of taste, or the science of the beautiful. Previous writers who had written on this subject had mostly limited their investigations to the beautiful in works of art; Baumgarten extended his researches to the qualities that constitute the beautiful in general, whether in natural or artificial objects, and to our faculty of perceiving the same. He divided the science of æsthetic into theoretical and practical: he developed his ideas first in his treatise, 'Disputatio de nonnullis ad Poema pertinentibus,' Halle, 1735, and afterwards in his 'Æsthetica,' Frankfurt on the Oder, 1750. Æsthetics has since become a distinct science, and is taught as such in the German universities. The other works of Baumgarten are 'Metaphysica;' 'Ethica Philosophica;' 'Initia Philosophiæ Practicæ.'

In 1740 Baumgarten was appointed professor of philosophy at Frankfurt-on-the-Oder. His constant application undermined his health, and after lingering in a weak state for several years, he died in 1762. He was a profound thinker, remarkably methodical in the arrangement of his thoughts, and precise in his exposition of them.

His elder brother, JAMES SIGISMUND, studied also at Halle, and became professor of theology in that university. He wrote 'Instructions on Moral Theology,' 8vo, 1738; 'Abridgment of Ecclesiastical History,' 3 vols. 8vo, 1745; 'Prima Lineæ Brevarii Antiquitatum Christianarum,' 1747, and other works on ecclesiastical studies. He introduced important ameliorations into the study of theology at Halle. He died in 1757.

MARTIN BAUMGARTEN, of Breitenbach, patrician of Nuremberg, no relation to the preceding, travelled in the east in the beginning of the 16th century, and left an account of his journey, which was published after his death under the title of 'Peregrinatio in Egyptum, Arabiam, Palestinam, et Syriam, facta annis 1507 et 1508, in lucem edita a Christophoro Donaver,' 4to, Nuremberg, 1594.

BAXTER, RICHARD. This eminent Nonconformist divine was born at Rowdon, a small village in Shropshire, on the 12th of November, 1615; but he resided till 1625 at Eaton Constantine, about five miles from Shrewsbury. His father's limited means prevented him from giving his son any education beyond what could be obtained from the village schoolmasters, who were neither competent teachers nor moral men. To Mr. John Owen, who kept the free grammar-school at Wroxeter, Baxter acknowledges some obligations. Though he was captain of the school, his acquirements were very inconsiderable when he left it. His ambition was to enter one of the universities to qualify himself for the ministry; but his master, Mr. Owen, recommended him to Mr. Richard Wickstead, chaplain to the council at Ludlow, who had an allowance from government for a divinity student. Though the defects in his previous education were but ill supplied by this arrangement (Wickstead being a negligent tutor), he had access to a good library, where he acquired a taste for those studies which he pursued with such indefatigable diligence in after life. Here he continued for eighteen months, when he returned to his father's house, and supplied for a few months the place of his old master at Wroxeter grammar-school. Finding all his hopes of going to the university disappointed, he resumed his professional studies under the direction of Mr. Francis Garbett, a clergyman of some celebrity, who conducted him through a course of theology, and gave him much valuable assistance in his general reading. While thus engaged, he was diverted from his pursuits by a proposition from his friend, Mr. Wickstead, to try his fortune at court. Theology was thrown aside, and Baxter went up to Whitehall, specially introduced to Sir Henry Herbert, master of the revels, as an aspirant to royal favour. His reception was courteous and even kind. For one month he mingled in the festivities of the palace,—a period which was sufficient to convince him of the unsuitableness of such a mode of life to his tastes, his habits, and his conscience;—he returned home, and resumed his studies with a determination never to be again diverted from them. Some books which he read increased that habitual seriousness which he derived from his natural disposition, as well as from the example of his father; and a protracted illness completed the preparation of his mind for the reception of those impressions of religious duty under which he acted through the remainder of his life.

While he was in this declining state of health, his anxiety to commence his ministerial labours overcame every other consideration. He applied for ordination to the Bishop of Worcester, and obtained it, together with a schoolmaster's licence, as he had accepted the mastership of the free grammar-school at Dudley, just then founded by his friend Mr. Foley of Stourbridge. He was then twenty-three years of age, and at this time entertained no scruples on the subject of conformity, having never examined with any nicety the grounds of subscription.

At the end of nine months Baxter removed from Dudley to Bridgenorth, where he acted as assistant to the clergyman. A release from his school engagements must, to such a mind as Baxter's, intent upon pastoral duties, have appeared a sufficient inducement for the change, but, in the then state of his feelings, it was of still greater moment to him to be relieved from the prospect of having to renew his subscription, to the terms of which his attention had now been directed. Bridgenorth is the centre of a little district comprising six parishes,

exempt from all episcopal jurisdiction, except a triennial visitation from the archbishop. Here he expected to perform the humble duties of a curate without obstruction, happy in the society of a colleague whose views harmonised with his own, and still happier in having a wide field for his exertions. But his hopes were soon frustrated by the 'et cetera oath,' as it was called, which enjoined all who had taken orders to swear that they would never consent to any alteration in the ceremonial or government of the church by archbishops, bishops, deans, archdeacons, &c. It does not appear that Mr. Baxter, any more than his brother clergyman at Bridgenorth, thought it necessary to observe the terms of this oath, for a complaint was laid against them for non-compliance with the ritual in various particulars.

Baxter left Bridgenorth after a residence of one year and nine months, on an invitation from a committee of the parishioners (1640) to become the officiating clergyman at the parish church in Kidderminster, the vicar having agreed, in order to settle disputes, to allow 60*l.* per annum to a curate of their own choosing. The living was afterwards sequestered, the townsmen collected the tithes, paid Baxter and Baxter's curate, and gave the vicar 40*l.* per annum. The circumstances under which Baxter settled at Kidderminster were favourable to his views; but it was not without considerable opposition from one portion of the community, whose vices he publicly reprov'd, that he carried some of his reforms into effect. Not satisfied with correcting the more flagrant offences of the inhabitants, he visited them at their houses, became acquainted with their families, gave them religious instruction in private, and became their friend as well as their pastor. By these means he soon wrought a complete change in the habits of the people. His preaching was acceptable to all ranks. Wherever he went, large audiences attended him; and his energy was so unremitting, notwithstanding his feeble health and constant indisposition, that he preached three or four times a week.

During the civil wars of that period Baxter held a position by which he was connected with both the opposite parties in the state, and yet was the partisan of neither. His attachment to monarchy was well known; while the deep stream of religious feeling which ran through the conversation of the parliamentarians drew his sympathies to that side. The undisguised respect paid by him to the character of some of the puritans, made him and many others, who were sincerely attached to the crown, the objects of jealousy and persecution. A clamour was raised against them, and the rabble, whose excesses had been checked by him, were eager enough to become the trumpeters of the charge. During one of these ebullitions of party excitement, Baxter spent a few days in the parliamentary army, and was preaching within sound of the cannon when the memorable battle was fought at Edge Hill. Not considering it safe to return to Kidderminster, he retired to Coventry, where he lived two years, preaching regularly to the parliamentary garrison and to the inhabitants. After the battle of Naseby, in 1645, he passed a night on a visit to some friends in Cromwell's army, a circumstance which led to the chaplaincy of Colonel Whalley's regiment being offered to him, which, after consulting his friends at Coventry, he accepted. In this capacity he was present at the taking of Bridgewater, the sieges of Exeter, Bristol, and Worcester, by Colonels Whalley and Rainsboro'. He lost no opportunity of moderating the temper of the champions of the commonwealth, and of restraining them within the bounds of reason; but as it was known that the check proceeded from one who was unfriendly to the ulterior objects of the party, his interference was coolly received.

After his recovery from an illness which compelled him to leave the army, we find him again at Kidderminster, exerting himself to moderate conflicting opinions. The conduct of Cromwell at this crisis exceedingly perplexed that class of men of whom Baxter might be regarded as the type. For the sake of peace they yielded to an authority which they condemned as a usurpation, but nothing could purchase their approbation of the measures by which it had been attained and was supported. In open conference Baxter did not scruple to denounce Cromwell and his adherents as guilty of treason and rebellion, though he afterwards doubted if he was right in opposing him so strongly. (See Baxter's 'Penitent Confessions,' quoted in Orme.) The reputation of Baxter rendered his countenance to the new order of things highly desirable, and accordingly no pains were spared to procure it. The Protector invited him to an interview, and endeavoured to reconcile him to the political changes that had taken place; but the preacher was unconvinced by his arguments, and boldly told him that "the honest people of the land took their ancient monarchy to be a blessing and not an evil."

In the disputes which prevailed about this time on the subject of episcopal ordination, Baxter took the side of the Presbyterians in denying its necessity. With them too he agreed in matters of discipline and church government. He dissented from them in their condemnation of episcopacy as unlawful. On their great principle, namely, the sufficiency of the Scriptures to determine all points of faith and conduct, he wavered for some time, but ultimately adopted it in its full extent. Occupying as he did this middle ground between the Episcopalians and the Presbyterians, it was not very obvious with which of the two parties he was to be classed. Had all impositions and restraints been removed, there is every reason to suppose that he would have preferred a moderate episcopacy to any other form of church government; but the measures of the prelatical party were so grievous to the

conscience, that he had no choice between sacrificing his opinions or quitting their communion.

It was expected that on the restoration of the king moderation would have prevailed in the councils of the nation, and a conciliatory policy have been adopted with regard to religious opinions. Some indication of such a spirit appeared in the appointment of Presbyterian divines among the king's chaplains, and Baxter along with the rest. Many who had access to the king strenuously recommended conciliation, and for a time their advice prevailed against the intrigues of court influence. Among other measures a conference was appointed at the Savoy, consisting of a certain number of Episcopalian and Presbyterian divines, to devise a form of ecclesiastical government which might reconcile the differences and satisfy the scruples of the contending parties. Baxter and the Presbyterians were extremely desirous of bringing this commission to a successful issue; and Baxter himself drew up a reformed liturgy, which with some alterations he presented at this conference. The Presbyterians would have accepted Bishop Usher's scheme as a model, with any alterations which might be mutually agreed upon; but the bishops were secretly opposed to the arrangement, and finally frustrated it by carrying a declaration to this effect, that although all were agreed upon the ends contemplated in this commission, they disagreed about the means. Having thus defeated the object of the conference, the next step was to sequester the livings of those divines who had been inducted during the Protectorate. Oaths and subscriptions, which had been suspended while there was any prospect of a union of parties, were again called for by the bishops and their adherents. In accordance with this demand a law was passed in 1662, called the Act of Uniformity, so strict in its requisitions upon the debatable points of ceremonial worship, that it had the effect of banishing at once two thousand divines from the pale of the English Church. Of this number was Baxter. Previous to the passing of this measure he had refused the bishopric of Hereford and other preferments offered him by Lord Clarendon, asking one favour only in lieu of them—to be allowed to return to his beloved flock at Kidderminster; but the favour was not granted.

On the 25th of May 1662, three months before the day on which the Bartholomew Act, as the Act of Uniformity was called, from its coming into operation on St. Bartholomew's day, Baxter had preached in London his last sermon, under a regular engagement in the church; and, finding his public duties at an end, he retired in July 1663 to Acton, in Middlesex, where he employed most of his leisure in writing for the press. Some of his largest works were the fruits of this seclusion. His two most popular treatises, 'The Saints' Everlasting Rest,' and 'A Call to the Unconverted,' were published before he left Kidderminster. Several attempts were made by the ejected ministers and their friends in parliament to get the rigorous restrictions against them removed, but without success. The persecutions continued with unabated violence. Even those who, like Baxter, disliked separation, and attended the worship of the church, suffered penalties for having morning and evening prayers at their own houses. In the midst of those awful calamities, the plague and the fire, which raged with such frightful devastation in two successive years, the services of the puritan divines to the inhabitants of the metropolis were so conspicuous, that the current of opinion turned in their favour, and led to new efforts in their behalf, which ended for the time in the Indulgence granted in 1672. This drew Baxter from his retirement at Totteridge, to which place he had removed on the suppression of his ministry at Acton. He settled again in London, and preached as a lecturer in different parts of the city, but more constantly at Pinner's Hall and Fetter-lane. An ineffectual attempt which he made at this time to combine the Protestant interests against Papal ascendancy exposed him to various misrepresentations, to remove which he published a vindication of himself in a tract entitled 'An Appeal to the Light,' but without eradicating the unfavourable impressions.

His time was now divided between writing and preaching. For a while he had a regular audience in a room over St. James's market-house, and at other places in London. But his public duties were frequently suspended by those rigorous enactments to which the Nonconformists were subjected during the last two reigns of the Stuarts.

In 1682 the officers of the law burst into his house, at a time when he laboured under severe indisposition, with a warrant to seize his person for coming within five miles of a corporation, and would have hurried him before a justice of the peace in this condition, had they not been met by his physician, whose interference probably saved his life as well as obtained his pardon. Two years later, while his health was still in a precarious state from a chronic disease, he was again harassed by distrains and penal proceedings. Still later it was his misfortune to be one of the unhappy victims of Jefferies. He was apprehended on a lord chief justice's warrant, on a charge of sedition and being hostile to episcopacy. The charge was founded on some passages in his 'Paraphrase of the New Testament.' On the trial, Jefferies, not content with using language the most opprobrious to the prisoner and his counsel, acted the part of prosecutor as well as judge, and scrupled not to gain his ends by silencing the accused, by insulting his counsel, by refusing to hear his witnesses, and by triumphing over his sentence. His punishment was a fine of 500 marks, to lie in prison till it was paid, and to be bound to his good behaviour for seven years.

For the non-payment of this heavy penalty he was committed to the King's Bench prison, where he lay until the 26th of November in the following year (1686), having been confined for nearly eighteen months. His pardon was obtained by the mediation of Lord Powis, and the fine was remitted. The solitude of his prison was enlivened on this, as on former occasions, by the affectionate attentions of his wife. Baxter himself lived to see that favourable change in reference to religious toleration which commenced at the Revolution of 1688. He died on the 8th of December 1691, and was buried in Christ Church.

The literary career of Baxter is not the least extraordinary part of his history. He published a body of practical and polemical divinity with a rapidity almost unequalled; the excellence of some of his practical writings secured them an unexampled popularity, and thus laid the foundation of a new theological system which still retains his name. The catalogue of his works is not easily described. It contains nearly 168 distinct publications. (See list in Orme's 'Life,' prefixed to the edition of his works, London, 1830.) His fame chiefly rests on his two most popular works, and on his 'Methodius Theologicus' and 'Catholic Theology,' in which his peculiar views are embodied. Baxter left behind him a 'Narrative of the most Memorable Passages of his Life and Times,' which was published in a folio volume after his death (1696) by his intimate friend Mr. Matthew Sylvester, under the title 'Reliquiæ Baxterianæ.' It is here that we find that review of his religious opinions written in the latter part of his life, which Coleridge speaks of as one of the most remarkable pieces of writing that have come down to us.

BAXTER, WILLIAM, nephew of the celebrated Richard Baxter, was born in 1650, at Launlun in Shropshire. His education is stated to have been so entirely neglected in his early years that at the age of 18, when he went to the school of Harrow-on-the-Hill in Middlesex, he knew not one letter in a book, nor understood one word of any language but Welsh; but he soon retrieved his lost time, and became a man of great learning. He applied himself chiefly to the study of antiquities and philology.

His first publication was upon Latin grammar—'De Analogiâ, sive Arte Latini Lingue Commentariolus: in usum Provecioris Adolescentiæ,' 12mo, London, 1679. In 1695 he edited Anacreon, 'Anacreontis Teii Carmina, Gr. Lat. Subjiciuntur etiam duo vetustissima Poëtriciæ Sapphus elegantissima Odaria, una cum correctione Isaaci Vossii: et Theocriti Anacreonticum in mortuum Adonin,' 12mo, London, 1695; reprinted with improvements in 1710. In 1701 his edition of Horace made its appearance, of which a second edition was finished by him but a few days before his death, and was published by his son John, under the title of 'Q. Horatii Flacci Eclogæ, una cum scholiis perpetuis,' 8vo, London, 1725. This for a long time was considered the best edition of Horace which had been published in England. It bore so high a character upon the continent as to be reprinted by Gesner at Leipzig, with additional notes, in 1752; and several times subsequently. In 1719 Baxter's 'Glossarium Antiquitatum Britannicarum' appeared, dedicated to Dr. Richard Mead, accompanied with a portrait of the author, engraved by Vertue from a picture by Highmore, painted when Baxter was in his 69th year. The Rev. Moses Williams also published Baxter's glossary of Roman antiquities, containing the letter A only, under the title of 'Reliquiæ Baxterianæ, sive Willielmi Baxteri Opera posthuma: Præmittitur eruditi Auctoris Vitæ à seipso conscriptæ Fragmentum,' 8vo, London, 1726.

These form the whole of Baxter's printed works. Baxter also wrote some letters on subjects of antiquity, which were printed in the 'Philosophical Transactions,' Nos. 306, 311, and 401; and in the first volume of the 'Archæologia' of the Society of Antiquaries.

Besides Latin and Greek, Baxter is allowed to have been skilled in the British and Irish tongues, as well as in the Northern and Hebrew languages. The greater part of his life was passed in the education of youth. Nichols, in his 'Literary Anecdotes,' states Baxter to have kept a boarding-school at Tottenham High Cross in Middlesex; but Dr. Robinson, in the 'History of Tottenham,' says he was the master of the Free Grammar school there. He was resident at Tottenham before 1697, and remained there till he was chosen master of the Mercers' school in London, which situation he held above twenty years, but resigned it before his death. He died May 31st, 1723, and was buried at Islington.

BAYARD, PIERRE DE TERRAIL, known by the honourable appellation of 'the Good Knight, without fear and without reproach' ('le bon Chevalier, sans peur et sans reproche'), was born, in the year 1476, at the Château de Bayard in Dauphiné. Almost all his immediate ancestors died on the field of battle: his great-grandfather fell at Poitiers; his great-grandfather at Cressy; his grandfather at Montherly; and his father also received many wounds in the wars of Louis XI. With a view to being educated for the profession of arms, he was placed, when thirteen years old, in the household of the Duke of Savoy as page, in which capacity he continued for five years. Bayard, when only eighteen years of age, carried away the prize in a tournament against one of the most experienced knights in France. When he had completed his eighteenth year he entered into actual service.

In the latter end of the year 1494, Bayard accompanied Charles VIII. in his expedition against Naples, and greatly distinguished himself at the battle of Fornovo, fought on the 6th of July in the next year. He

had two horses killed under him in this engagement, and he performed numerous feats of that romantic valour which has perpetuated his name as one of the last and best representatives of the days of chivalry. Bayard served also in the Italian wars of Louis XII., which began in 1499. On one occasion he kept a bridge over the Garigliano single-handed against 200 Spaniards, long enough to enable the main-body of the French to make good their retreat.

Bayard was also present at the famous 'battle of the Spurs,' fought at Guingaste near Terouenne in Picardy, on the 16th of August, 1513. Either from panic or mistaken orders, the French gendarmerie, when retreating from the English force, commanded in person by the then youthful Henry VIII., fled before the English cavalry in disgraceful confusion. But for the presence of mind and daring valour of Bayard, the whole French army would have shared in the disgrace of the gendarmerie. He retired with fourteen men-at-arms, often turning on his pursuers, till he reached a place where only two could pass in front. "We halt here," said he, "the enemy will be an hour gaining this post. Go and tell them so at the camp." He was obeyed, and succeeded in gaining time for the French army to re-assemble itself, but was compelled to surrender himself as a prisoner. Seeing an English knight resting wounded under a tree, Bayard required him to surrender; the knight, wholly unable to resist, gave up his sword, when Bayard returned his own, saying, "I am Bayard, and now your prisoner." Henry was so well pleased with this ingenious conduct, that the two knights were soon exchanged on their parole. The Emperor Maximilian, who was serving in Henry's army, taunted him with the remark that he thought Bayard was one who never fled. "Sire, if I had fled I should not have been here," was the prompt answer.

Bayard attended Francis I., then in the pride of youth, and ambitious of the honours of chivalry, in the war undertaken to recover Milan and the other Italian conquests of his predecessor. The bloody battle of Marignano, September 13, 1515, which lasted two days, was fought with a fierceness that made Trivulzio, the French commander, who had been in eighteen pitched battles, exclaim that "all other fights compared with this were but children's sport; this is the war of giants." Bayard displayed his usual romantic daring and prowess. When the battle was won, Francis, who had fought by his side, and who had witnessed his extraordinary valour, begged and received the honour of knighthood at his hands upon the field.

The next great service which Bayard rendered his country was the obstinate and successful defence of Mezières, on the Netherlands frontier of France, in 1522, against the Count of Nassau, with a force of 35,000 men, aided by a strong artillery. The garrison consisted of only 1000 men, but such was the fame of Bayard, that many of the young nobility of France considered it the highest honour to be engaged under him in the defence of this frontier town.

In 1524 Bayard had a command in the force which Francis I. sent to Italy to act against the army of the Emperor Charles, directed by the celebrated Duke of Bourbon. The command-in-chief was intrusted to Bonnivet, whose only qualification was personal courage. After various movements and partial successes, Bonnivet was compelled to abandon his strong entrenchments at Biagrasso, and move nearer to the Alps, in expectation of reinforcements from Switzerland. He was pursued by the imperial forces, who attacked his rear with great fury just as he had reached the banks of the Sesia. Bonnivet, while displaying much valour in rallying his troops, was wounded in the arm by a ball from an arquebus. He sent to Bayard immediately, telling him that the fate of the army was in his hands. Bayard, who had in vain throughout the campaign remonstrated with Bonnivet on the course he was pursuing, replied, "It is now too late, but I commend my soul to my God; my life belongs to my country." He then put himself at the head of the men-at-arms, and kept the main-body of the enemy occupied long enough to enable the rest of the French forces to make good their retreat. While thus engaged he received a mortal wound from a ball, and fell from his horse. He was pressed to withdraw from the field, but his answer was that he had never turned his back upon an enemy. He ordered himself to be placed with his back against a tree, and his face to the enemy. In this situation he was found by Bourbon, who expressed his regret at seeing him in this condition. "Pity not me," said the dying man, "I die as a man of honour ought, in the discharge of my duty; they, indeed, are objects of pity who fight against their king, their country, and their oath." The Marquis of Pescara, commander of the Spanish troops, passing soon after, manifested (we quote from Robertson's 'Charles V.,' book iii.) his admiration of Bayard's virtues, as well as his sorrow for his fate, with the generosity of a gallant enemy; and, finding that he could not be removed with safety from that spot, ordered a tent to be pitched there, and appointed proper persons to attend him. He died, notwithstanding their care, as his ancestors for several generations had done, on the field of battle. Pescara ordered his body to be embalmed and sent to his relations. In Dauphiné, Bayard's native country, the people of all ranks came out in a solemn procession to meet it.

BAYAZID I., surnamed ILDIRIM, or 'the Lightning,' in allusion to the rapidity of his military achievements, was the son of the sultan of the Osmanlis, Murad I. He was born A.H. 748 (A.D. 1347), and came to the throne in A.H. 792 (A.D. 1389), after his father had been killed in an engagement with the Servians near Cossova. The

Osmanli dominions at this epoch extended from the Danube to the Euphrates; and Bayazid, at the head of his army, was almost incessantly moving from one extremity of his empire to the other, to reduce his Mohammedan neighbours to obedience, or to add to his possessions by conquests from the Christian powers of Europe. Brussa and Adrianople were respectively the Asiatic and European capitals of his dominions, and the erection of a magnificent mosque in each of them is one of the earliest acts of his reign that we find recorded. This seemingly pious act forms a strong contrast with his behaviour to Yacub, his only brother, whom he put to death almost immediately on ascending the throne, from no other motive than an apprehension that the example of other eastern princes might encourage him to rebel, and dispute Bayazid's right to the throne.

The conquests of the Osmanlis had, in the beginning of the 8th century of the Mohammedan era (the 14th after Christ), put an end to the Seljukide dominion in western Asia, and on its ruins several small dynasties had sprung up, all of which were subdued by Bayazid, and incorporated with the Turkish empire. Bayazid had to encounter greater difficulties in subduing the principality of Caramania. Timur-tash, his general, had conquered part of the country, when Alâ-eddin, the reigning sovereign, defeated him in a battle and took him prisoner. When this happened Bayazid was on the banks of the Danube, engaged in a war with Stephan, the prince of Moldavia. On receiving the news of Timur-tash's defeat, Bayazid hastened from Europe into Asia, and within a very short time subdued the whole of Caramania.

The year 1391 is remarkable for the capture of Philadelphia, or Alashehr (that is, 'The Variegated City'), the last Greek town in Asia Minor that continued faithful to the Byzantine empire. Its Greek commander made a vigorous resistance to the besieging forces of Bayazid, and rejected his invitation to surrender the fortress; while the emperor Joannes and his son Manuel, then the confederates of the sultan, were actually assisting in the siege.

In 1393 Bayazid undertook another expedition into Europe, in which he took possession of the towns of Saloniki and Yenishahr (Larissa), and for the first time besieged Constantinople. He compelled the emperor to give up his plan of adding to the strength of the capital by new fortifications, and to assign a separate suburb to the Turks with a mosque and a kadi, or judge, of their own.

In 1396 Bayazid gained an important victory near Nicopolis, on the Danube, over an army of 100,000 Christians, including many of the bravest knights of France and Germany, who had assembled under the standard of Sigismund, the king of Hungary, to check the farther progress of the Mohammedan power in Europe. The greater part of the Christian forces were slain or driven into the Danube. Sigismund escaped to Constantinople. Sixty thousand Turks are stated to have fallen in the same battle; and when Bayazid became aware of the extent of his loss, he gave orders to put to death all the prisoners, with the exception of twenty-four nobles, who were subsequently ransomed. This great victory was soon followed by further conquests in Greece.

The dominions of Bayazid and those of the Tartar conqueror Timur now touched each other in the neighbourhood of Erzerum and on the banks of the Euphrates. With doubtful limits between the two empires, which had never been defined by treaty, a cause for war between two jealous sovereigns could not long be wanting. Timur had taken possession of Siwas (the ancient Sebaste), on the Halys, and had treated its inhabitants with great cruelty. Bayazid was then engaged in his European dominions, which prevented him from resenting this violation of his territory. About the same time two Mussulman princes, Ahmed-Jelair and Kara-Yussuf, whom Timur had deprived of their possessions, fled for protection first to Seifeddin-Barkuk, the sultan of Egypt, and subsequently to Bayazid, who received them with kindness. Timur sent two embassies for the purpose of demanding the surrender of the princes; but Bayazid refused to comply, and instigated by the advice of the princes, took possession of Erzincan, a town situated on the Euphrates within the dominions of Timur. Timur, who now determined to commence an open war against Bayazid, begun the campaign by taking Haleb, Antakia, and other Syrian towns that were subject to the Osmanlis. He was at Siwas when he received information of the approach of Bayazid from the west. The two sovereigns, at the head of their armies, met in the plains of Angora, the capital of the ancient Galatia. A decisive battle took place (according to M. von Hammer's calculations on the 19th of Zulhaj A.H. 804, that is, the 20th of July A.D. 1401), in which the Osmanlis were totally defeated, and Bayazid became a prisoner in the hands of Timur. The conqueror, according to his Persian biographer, Sherifeddin, received Bayazid with great kindness, assigned him suitable accommodations, and continued to treat him with distinction till he died, A.H. 806 (A.D. 1403). D'Herbelot ('Bibliothèque Orient.,' art. 'Timour'), M. von Hammer, and most recent authorities, accept this account, and reject as a fable the common report which would charge Timur with great cruelty towards his prisoner. But it is only fair to state that Sir William Jones ('Works') draws our attention to a passage in another contemporary historian, Ebn-Arabshah's life of Timur, which had been overlooked by D'Herbelot, in which the Arabian author expressly affirms "that Timur did inclose his captive, Ilderim Bayazid, in a cage of iron, in order to retaliate the insult offered to the Persians by a sovereign of Lower Asia, who had treated

Shapur, king of Persia, in the same manner; that he intended to carry him in this confinement into Tartary, but that the miserable prince died in Syria, at a place called Akahehr." Busbequius also, who visited Constantinople as ambassador from the German emperor about the middle of the 16th century, has a passage to the following effect: that Bayazid, after his defeat, became a prisoner in the hands of Timur, who treated him with great cruelty; that his wife, who was also made a prisoner, was grossly insulted before his face; and that from this time till the age of Soliman I., who reigned from 1520 to 1566, the Osmanli sultans have never married, for fear that the reverses of fortune might expose them to similar insults.

Bayazid was succeeded upon the throne of the Osmanli empire by his son Mohammed I.

BAYAZID II, the eldest son of Mohammed II., was born in 1447, and in 1481 succeeded his father on the throne of the Osmanli empire, which he occupied till 1512. Bayazid was governor of Amasia when his father died (May 3, 1481). Upon receiving the news of his demise he hastened to Constantinople, but had to establish his claims to the throne by a contest with his brother Zizim, or Zizymus. Zizim was defeated in a battle at Yenishahr, near Brussa, June 20, 1481; and was ultimately placed in the hands of Pope Alexander VI., by whom he is said to have been poisoned at the instigation of his brother (February 24, 1495).

A considerable part of Bayazid's reign was spent in war. When Mohammed II. died the Osmanli empire was engaged in a conflict with Venice. Bayazid found it necessary in 1482 to conclude a peace which secured considerable advantages to the republic. In 1485 Bayazid declared war against Kait-Bey, the Manluk sultan of Egypt. Karagios-Pasha, the commander of the Osmanli army, suffered two signal defeats, and in 1491 a peace was negotiated upon terms by no means advantageous or creditable to the Osmanli arms. In the same year, while carrying on the war in Albania, Bayazid had a narrow escape from an assassin who had approached him in the disguise of a monk. This incident gave rise to the rule ever since most strictly observed at the Turkish court, that no one bearing any weapon is admitted into the presence of the sultan.

The year 1490 is remarkable in Turkish history for the first treaty concluded between the Osmanli government and that of Poland, and in 1495 we find recorded the first diplomatic relations between the sultan and the czar of Moscow. In 1499 another war broke out between the Turks and Venetians. A Venetian fleet was defeated in a battle near the island of Sapienza, July 28, 1499; and Lepanto (Naupactos), Modou, Coron, and Navarino were besieged and taken by the Osmanlis, while Iskandar-Pasha with a land army invaded and laid waste the country along the river Tagliamento in the north of Italy. A combined Venetian and Spanish fleet took possession of Ægina and Cephalonia, and captured twenty Turkish galleys. By the treaty of peace, which was concluded in December 1502, the Venetians were obliged to leave the island of Santa Maura in the hands of the Turks; but they kept possession of Cephalonia, and obtained the privilege of appointing a consul at Constantinople and of trading in the Black Sea.

Bayazid was induced to yield a peace upon such conditions by the rapid rise of the Persian power on the eastern frontier of his dominions under Shah Ismail, the founder of the Safawi (commonly called the Sofi) dynasty. Shah Ismail had encroached upon the Osmanli territory near Tokat, and when forced to retreat by the governor of the province, had taken possession of Merash. Bayazid was now desirous of repose, and wished to appoint Ahmed, one of his sons, as successor to the throne. A civil war followed for some time between Korkud the eldest son, Ahmed, and Selim. At length Selim prevailed. Bayazid was obliged to resign the government in his favour, and Selim, supported by the Janissaries and the great mass of the people of Constantinople, ascended the throne on April 25, 1512. Bayazid quitted the capital in order to spend the remainder of his life in peaceful retirement at Demitoka, his birthplace; but he died on his journey thither at Aya, near Hama, May 26, 1512.

(Von Hammer, *Geschichte des Osmanischen Reichs*, vol. ii. p. 250, &c.)

BAYER, JOHN, was born at the town of Rhain in Bavaria, in 1572. He followed the profession of an advocate at Augsburg, where he died in 1625, having lived a bachelor fifty three years. He was an astronomer, and a diligent inquirer into antiquity. The preceding particulars are (or were) stated in his epitaph, in the church of St. Dominic at Augsburg.

Bayer has immortalised his name, as Delambre remarks, at a very cheap rate. He published charts of the stars in 1603, in which, for the first time, he distinguished one from another by affixing letters. When Flamsteed and others adopted this practice, which has since become universal, the letters of Bayer were followed, which has made his maps valuable; otherwise they are not so good as those of Hevelius.

The first edition of Bayer's maps was published at Augsburg in September 1603, with the following title:—*Johannis Baieri Rhainensi, J. C., Uranometria, omnium asterisomorum continens schemata novâ methodo delineata, aëris laminis expressa.* The title given by Lalande ('*Bibliogr. Astr.*') is incorrect. He had obtained the constellations visible in the northern hemisphere from the catalogue of Tycho Brahe, and those about the south pole from Americus Vesputius and others. (Kepler, 'Tab. Rudolph,' cited by Kautner.) It is not known whether

he observed himself, but Riccioli, in the words "suis vigiliis astronomiæ aucta et emendata," implies that he did; and Bartschius ('*Planiph.* in Pref. ad Lect.')

affirms that Bayer was not in possession of the more recent observations of Tycho Brahe, and that his places were erroneous in consequence. There are fifty-one maps by Bayer, namely, two of the hemispheres, one of nine constellations about the south pole, and forty-eight of single constellations. The Greek letters are employed to denote the stars, and where the Greek alphabet ends the Roman small letters are used.

The following is the list of Bayer's constellations, after each of which is placed the letter with which the reckoning ends; so that by looking at the numbering of the two alphabets annexed, the number of stars reckoned by him may be seen. In applying the letters he seems to have arranged the stars in order of brilliancy: thus α is the largest star in a constellation, that is, the largest in the opinion of Bayer, observing with the naked eye, in and about the year 1600. Bayer's names and spellings are retained. The constellations are all in Ptolemæus.

In Delambre's list ('*Hist. de l'Ast. Mod.*'), in Canis Major, for α — θ read α — ϵ . The title of the last map is presumed by us, as the only copy of the first edition we know of does not contain it, and the succeeding editions have no letter-press. The constellations in Italics are those of which a front view is presented, of which we shall presently speak.

In this first edition, the letter-press is on the back of the plates. It contains, in addition to what has been noticed, the various names of the constellations and single stars, together with the planets with which they were supposed to have astrological affinities.

In order to restore, as he supposed, the sphere of Ptolemæus, Bayer has inverted many of the constellations, and made them turn their backs; and this he has done upon an ecliptic and equator so disposed as to place the spectator inside. The state of the question is this; it is pretty clear either that Ptolemæus imagined himself on the outside of the globe, looking on the backs of the constellations, or in the inside, looking on the fronts: for neither of the two remaining suppositions will place those stars on the right or left arms, &c., which Ptolemæus places there. The alternative might be easily settled by remarking whether the stars in the body are placed in the front or back; but, unfortunately, Ptolemæus generally refers them to some part of the dress or arms which has both back and front, such as the belt of Orion; but in the few instances which are tests, Ptolemæus always names the back, the only exception we know of being a star in Virgo, which is said to be in the front face (*πρόσωπον*), which may be reconciled with the rest by supposing the back of a figure with the face turned sideways. Therefore, to represent Ptolemæus completely, an outside of a sphere, or part of a sphere, must be drawn; and on an inside sphere there is only the choice of changing left into right, and vice versa, by

drawing backs, or backs into fronts, and vice versa, by drawing fronts. Bayer has chosen the first, with the exceptions noted in italics in the preceding list, for which he has been blamed by Schickard, Bartsch, Hevelius, Flamsteed, and others: but, singularly enough, he has not carried his own system through; for Andromeda, of which he has represented the face, is precisely one of those signs in which a crucial word is found in Ptolemaeus, who places one star between the shoulders (*ἐν τῷ μεταρρήνῳ*). Flamsteed cuts the knot by assuring us that *ῥῶρον* and *μεταρρῆνον*, which vulgar scholars imagine to mean 'the back,' and 'the part of the back between the shoulders,' sometimes mean 'the front' and 'the chest,' in proof of which he brings his own conviction, that Homer and others must in some places have adopted these senses. Montucla, with great probability, conjectures that Bayer intended to draw a convex sphere, but overlooked, or was ignorant of, the proper method of inverting the figures on the copper.

Circumstances which we shall have to mention in FLAMSTEED make it worth while to give the preceding details. The rest of the history of Bayer's work is as follows:—In 1627, Julius Schiller published at Augsburg his 'Cœlum Stellatum Christianum, &c. sociali operâ J. Bayeri, &c. Uranometriam novam priore accuratiorum locupletiorumque suppeditantis.' This was an attempt to change the names of the constellations into others derived from the Scriptures; as, for instance, calling the twelve signs of the zodiac after the apostles, &c. The northern constellations were taken from the New Testament and the southern from the Old. Schiller's account is as follows: that Bayer, having laid down the positions of the stars, left all the rest to Schiller, but died before the whole (and *Ursa Minor* in particular) was completed, and without having time to finish some astronomical 'Prolegomena;' that the new Uranometry of Bayer differed from the old in the number and positions of the stars, which he had altered, as well from many nights' observations of his own (whether of positions or of magnitudes is not stated), as from various books which he had found; and that, for this reason, he (Bayer) was anxious that the old Uranometry should never be republished. These maps also represented the convex side of the sphere, that men might see the fronts of these Christian constellations, it being judged indecorous that the apostles should turn their backs. Thus we see that Bayer committed a mistake again, as far as Ptolemaeus's sphere is concerned. He should have drawn the inside or concave of the sphere, in turning the fronts towards the spectator. This work of Schiller's is also mentioned by Gassendi as follows: 'Cœlum Christianum a J. Bayero affectum, et a Julio Schillero confectum.' (Gass. 'Vit. Peir.' in ann. 1628.) It is remarkable that, in this edition, Bayer has abandoned his letters and taken numbers, either of his own or from Ptolemaeus. The plates are remarkably well executed for the period, and the grouping of the constellations is strikingly beautiful, but the stars are almost lost in the shading.

Schiller states, that a surreptitious edition of Bayer was offered for sale at Frankfurt Fair in autumn 1624; which, by means of the words 'novâ methodo delineata,' was made to pass for the expected edition of 1627, that is Schiller's own; but it was struck from the same plates as that of 1603, and therefore probably could not be distinguished from the subsequent editions.

The second edition of the 'Uranometria' (plates only, and without letter-press) was printed at Ulm in 1648, and the third (plates only) at Ulm in 1666. In the meanwhile, the letter-press of the first edition, with additions, had been printed under the following clumsy title: 'Explicatio Characterum æneis Uranometriæ Imaginum Tabulis insculptorum addita.' First edition, Strasbourg, 1624; second, Ulm, 1640; third, Augsburg, 1654; fourth, Ulm, 1697.

BAYER, GOTTLIEB SIEGFRIED, grandson of John Bayer the astronomer, was born at Königsberg in 1694. He applied zealously to the study of the Oriental languages under the tuition of Abraham Wolf, and of some learned Rabbis: he also took a peculiar interest in the study of the Chinese language. After travelling in various parts of Germany for his improvement, he returned to Königsberg in 1717, when he was appointed librarian to the University. In 1726 he was called to St. Petersburg to fill the chair of Greek and Roman Antiquities. His health became impaired by intense study, and he died February 21, 1738. He wrote numerous works, some of which are printed separately; others are inserted in the 'Memoirs of the Academy of St. Petersburg' and in the 'Acta Eruditorum;' and some were left at his death in manuscript. Of those that have been published separately the principal are: 'Museum Siniicum,' 2 vols. 8vo, St. Petersburg, 1730. The greater part of the first volume is occupied by an interesting preface, in which the author recapitulates the labours of those who preceded him in the field of Chinese literature; this is followed by a general Chinese grammar; and by a grammar of the popular Chinese dialect of the province of Chin Cheu, which, he says, differs but little from the language of the learned or mandarins. This is followed by a letter from some missionaries at Tranquebar concerning the Tamul language. The second volume contains a Chinese Lexicon, extracts from several Chinese works, a commentary on the Siao ul lun, or Origines Sinices, a treatise on Chinese chronology; and another on the weights and measures of the Chinese. 'Historia Oarhoëna et Edessena ex numis illustrata,' 4to, 1734, 'Biog. Univ.' This work, which he dedicated to Joseph Simonius Assemani, is much esteemed. 'De Eclipsi Sinica liber singularis,' in which he examines and confutes

the Chinese account of a total eclipse, which a Jesuit asserted to have occurred at the time of our Saviour's death. Of his scattered dissertations, some are on the Mongol, Tangutian, and Brahmanic languages; one is 'De Elementis Calmucis;' another on some books in an unknown language, found near the banks of the Caspian Sea. His 'Opuscula,' which treat of several topics of erudition, were published by Klotz, 8vo, Halle, 1770, with a biography of Bayer.

BAYLE, PETER, an eminent critic and controversial writer of the 17th century, was born November 18, 1647, at Carla-le-Comté, in the department of Anège (the ancient county of Foix) in France. Of his early life we shall only state, that he displayed great aptitude for learning, and an uncommon passion for reading, and that his education was commenced under the care of his father, the Protestant minister of Carla, continued at the Protestant University of Puy-laurens, where he studied from February 1666 to February 1669, and concluded at the Catholic University of Toulouse. He had not been there more than a month when he made public profession of the Roman Catholic religion, to which, it is said, he was converted by the free perusal of controversial divinity at Puy-laurens. It would seem that his creed was lightly taken up, for, during his short residence at Toulouse, he was reconverted to Protestantism by the conversation of his Protestant connections.

In August 1670 he made a secret abjuration of Catholicism, and went to Geneva, where he formed an acquaintance with many eminent men, and especially contracted a close friendship with James Basnage and Minutoli. At Geneva and in the Pays de Vaud he lived four years, supporting himself by private tuition. In 1674 he removed first to Rouen, and soon after to Paris. The treasures of the public libraries, and the easy access to literary society, rendered that city agreeable to him above all other places. He corresponded freely on literary subjects with his friend Basnage, then studying theology in the Protestant University of Sedan, who showed the letters to the theological professor, M. Jurieu. By these, and by the recommendations of Basnage, Jurieu was induced to propose their author as a proper person to fill the then vacant chair of philosophy, to which, after a public disputation, Bayle was elected, November 2, 1675. For five years he seems to have been almost entirely occupied by the duties of his office. In the spring of 1681 however he found time to write his celebrated letter on comets, in consequence of the appearance of the remarkable comet of 1680, which had excited great alarm among the superstitious and vulgar. But the licence for its publication being refused, it was not published till the following year, after the author's removal to Rotterdam.

In July 1681 the University of Sedan was arbitrarily disfranchised by a decree of Louis XIV. Deprived of employment, Bayle obtained, through the agency of one of his pupils, a pension from the magistracy of Rotterdam, who were induced to form a new establishment for education, in which Bayle was appointed professor of history and philosophy, and Jurieu of theology. Bayle delivered his first lecture in December 1681. In the following spring the letter on comets was anonymously printed; but its author was soon discovered, and obtained a considerable increase of reputation. In the same spring (1682) he wrote an answer to Maimbourg's 'Histoire du Calvinisme,' a libellous misrepresentation of the conduct of the French Protestant Church. ('Critique Générale de l'Hist. du Calv. de M. Maimb.') This was composed in a fortnight, during the Easter vacation. It met with great success, and having been condemned to be publicly burnt in Paris, was bought and read in that city with great avidity.

We pass over some minor works to mention that in 1684 Bayle commenced his 'Nouvelles de la République des Lettres.' These were published monthly, beginning with March 1684, and consisted of a series of reviews of such works as the editor thought worthy of special notice, and a list of new publications, with short remarks on them. In May the states of Friesland offered to make Bayle professor of philosophy in the University of Franeker, but he declined the appointment, although it was more lucrative than that which he held. On completing the first year of the 'Nouvelles,' Bayle affixed his name to the work, contrary to his usual practice, which was carefully to conceal the parentage of all that he wrote. In fact, whether from timidity, habitual love of secrecy, or the wish to leave himself at liberty to take either side of a question, Bayle generally employed the most elaborate devices of false dates and fictitious prefaces, to divert public suspicion from himself.

At this time men's minds were deeply steeped in the bitterness of political and religious dissension. The revocation of the Edict of Nantes, and persecution of the French Protestants, had raised a violent indignation on the part of those who were banished for conscience-sake, and a strong sympathy in all Protestant countries for the sufferings of their brethren. Bayle expressed his feelings on this subject with moderation in the 'Nouvelles;' but he made a bitter attack on the dominant church in an anonymous publication ('Ce que c'est que la France toute Catholique sous le Règne de Louis le Grand'), which he followed in the same year (1686) by a 'Philosophical Commentary on the words of St. Luke xiv. 23, "Constrain them to come in." In these two works he laboured to expose the atrocious conduct of the French government towards the Protestants, and the odious nature of persecution in general. The pains which Bayle bestowed upon this work brought on an illness in the spring of 1687, which incapacitated

him for literary exertion during more than a year. He was obliged to give up his periodical, but it continued to be published by another hand.

In 1690 there appeared a book, once celebrated, now forgotten, entitled 'Avis Important aux Refugiez,' &c., containing a violent attack on the doctrines and conduct of the French Protestants. This work Jurieu, whose former friendship had long given way to jealousy of the reputation, or dislike of the opinions, real or suspected, of his colleague, chose to attribute, without any proof, to Bayle, upon whom he published a violent attack. ('Examen d'un libelle intitulé Avis Important,' &c.) Bayle retorted in 'La Cabale Chimérique,' Rotterdam, 1691, followed by 'La Chimère de la Cabale de Rotterdam démontrée,' &c. It is not necessary to trace the progress of the quarrel, which was marked by great asperity. The question whether Bayle was the author of the 'Avis,' &c., or not, a question deeply affecting his literary integrity, can hardly be regarded as determined. Bayle always denied it. His friend and biographer, Des Maizeaux, seems nevertheless to disbelieve his assertions.

Whether Jurieu was right or wrong in his accusation, his precipitate and violent conduct drew on him great discredit, especially at Geneva. But he possessed much influence in Holland, which he employed in inducing the Consistory of Rotterdam to review his adversary's letter on comets, which they condemned as containing dangerous and anti-christian doctrines. This was employed by the magistracy of Rotterdam as an excuse for depriving him of his pension and licence to teach; but the real cause, according to Des Maizeaux, was the express command of William III., who exercised an overpowering influence in that body, and who was led to believe that Bayle was deeply engaged in advocating the views and wishes of the court of France. The injury thus done to our author was slight, for his habits were simple and unexpensive, and it left him at liberty to attend to his chief work, the 'Dictionnaire Historique et Critique.' His first scheme in respect of this undertaking was to compose a dictionary, expressly to correct the errors of other dictionaries; and he proceeded so far as to publish a specimen of the intended work ('Projet et Fragmens d'un Dictionnaire Critique.'). But this specimen not suiting the public taste, he altered his plan, and produced his dictionary in the form in which it now is. The composition of it, together with his paper warfare with Jurieu, engrossed his time until August 1695, when the first volume appeared; the second volume, which completed the first edition, was printed in 1696, but bears the date of 1697. It obtained great popularity, so that a second edition was soon called for; but it gave great offence to the religious, and incurred a public censure from the Consistory of Rotterdam. Five principal errors were alleged against it:—1. The indecency visible in many passages; 2. The tendency of the whole article on David; 3 and 4. The support covertly given to the Manichean doctrine of evil, and the sceptical tenets of the philosopher Pyrrhon; 5. Too studious commendation of Epicureans and atheists, by which a tacit support was supposed to be given to their tenets. The author submitted to the authority of the church, and promised to amend the faults in a second edition. According to promise, the article David was replaced by another; but the purchasers exclaimed loudly against this interference with the work, and the publisher finally reprinted the obnoxious article in a separate form. It is to be found at the end of the second volume of the editions of 1720 and 1730, &c. As to the other objections, instead of altering, Bayle defended himself and his work in a series of 'Eclaircissements,' subjoined to the second edition of 1702, and published in subsequent editions of the book.

After the publication of the second edition, which was considerably enlarged, Bayle amused himself by preparing the first volume of 'Réponses aux Questions d'un Provincial,' intended, as he says, "to occupy a middle place between books for study and books for recreation." In 1704 he published a defence of his 'Letter on Comets,' which engaged him in a controversy, which lasted for the rest of his life, with Le Clerc, the well-known author of the 'Bibliothèque Choisie,' and a theological writer named Jaquelot. To this discussion the second and third volumes of the 'Réponses aux Questions' &c., 1705, were devoted. Controversy seems to have been Bayle's pleasure; and it is probable that the attacks made on his works made no impression on his tranquillity; but his enemies had nearly done him a serious injury by endeavouring to procure his banishment from Holland in 1706, by reviving the accusation that he was a secret agent of France. His last works were a fourth volume of the 'Réponses,' and 'Entretiens de Maxime et Themiste,' in answer to Le Clerc; and a second book under the same title, in answer to Jaquelot. The last was not quite finished: he was working on it the evening before his death, which took place December 28, 1706, in the 60th year of his age.

Bayle's life and habits, in the relations of man to man, were simple, temperate, and moral. Without a cynical or affected contempt, he displayed a truly philosophical indifference to wealth; and he lived independently, in virtue of the moderation of his wants, yet not imprudently, for he left a legacy of 10,000 florins to his niece. The worst moral charge brought against him is that of literary duplicity; and of this he had no right to complain; for a man who is known to conceal his authorship under the thickest disguises of false names, false dates, and false prefaces, need not wonder if much which cannot be proved is believed to be his. The same spirit of concealment

attended him in religion; for whether he was Atheist, Epicurean, or Christian, it is at least pretty clear from his writings that he could not have been at heart a member of the strict church to which he outwardly conformed.

Warburton describes Bayle very accurately:—"A writer whose strength and clearness of reasoning can be equalled only by the gaiety, easiness, and delicacy of his wit; who, pervading human nature with a glance, struck into the province of paradox as an exercise for the restless vigour of his mind; who, with a soul superior to the sharpest attacks of fortune, and a heart practised to the best philosophy, had not yet enough of real greatness to overcome that last foible of superior geniuses—the temptation of honour, which the academic exercise of wit is supposed to bring to its possessors." ('Divine Legation,' book i. sect. 4.)

The later folio editions of Bayle's 'Dictionary' are comprised in four volumes. The 'Supplement' by the Abbé Chaupepie occupies four more. Bayle's miscellaneous works, of which we have not given anything like a complete list, fill four volumes also.

BAYNE, ALEXANDER, of Rires, first professor of the municipal law of Scotland, was the son of John Bayne of Logie in the county of Fife, who was descended from the old Fifeshire family Bayne of Tulloch, to whom he was served heir in general on the 8th of October 1700. ('Inquis. Return. Abbrev.'). On the 10th of July 1714, he passed advocate at the Scottish bar. In January 1722, the faculty appointed him senior curator of their library, and on the 28th of November, in the same year, he was constituted by the town-council of Edinburgh professor of Scots law in the university of that city.

The common law of Scotland was substantially the same with that of England till the erection of the Court of Session in the beginning of the 16th century, when, in consequence of the peculiar constitution of that court, the old common law was superseded by the principles of the civil and canon laws, which thereupon became, in fact, as in legal acceptation, the common law. The consequence was, that till the beginning of the last century, when the sources of the Scottish law ceased to be sought in the Roman code, preparation was generally made for the Scottish bar at some one of the foreign colleges. Of these, the colleges of France and Italy were the most frequented, till those of the Low Countries, aiding the connection which arose between Scotland and them at the Reformation, drew the student thither. On the erection of the University of Edinburgh however, attempts were made by the bench and bar to remedy the inconvenience of foreign study, but as the object of those attempts was to establish a chair of civil law, they were long baffled by the want of means of preparatory instruction in the language of that law. In the end of the 17th century private lectures on the law began to be given in Edinburgh by members of the faculty, and at length, in 1707, a chair of public law was founded; and, in 1709, the chair of civil law. By this time however the natural working of an independent judicature, and, still more, the operation of the union with England, by which the Scots courts were subjected to an appellate jurisdiction common to both parts of the island, carved out a system of law in many respects different from that of Rome, and requiring a separate chair for its elucidation. We believe however that the establishment of the professorship to which Mr. Bayne was appointed, was by no means popular with the profession. The 'Faculty Records' contain no allusion to his appointment. The only record of it which we have is in the 'Council Register,' where, under date 28th November 1722, there is this entry:—"Mr. Alexander Bayne having represented how much it would be for the interest of the nation and of this city, to have a professor of the law of Scotland placed in the university of this city, not only for teaching the Scots law but also for qualifying of writers to his Majesty's signet; and being fully apprised of the fitness and qualifications of Mr. Alexander Bayne of Rires, advocate, to discharge such a province—therefore the council elect him to be professor of the law of Scotland in the university of this city, for teaching the Scots law and qualifying writers to his Majesty's signet." (Bower, 'Hist. of the Univ. of Edinb.'). But only a year elapsed when his despised chair began to work a change on the course of examination for the bar, and on the system of legal study. In January 1724, Mr. Dundas of Arniston proposed to the faculty, that all Intrants should, previous to their admission, undergo a trial, not only in the civil law, as heretofore, but also in the municipal law of Scotland; and though this was long resisted, it was at length determined by Act of Sederunt, 28th February 1750. We apprehend it is to Bayne, also, we ought to concede the impulse given at this time to investigate the sources of the Scottish ancient common law.

In 1726 Mr. Bayne retired from the office of senior curator, and in the same year he published the first edition of Sir Thomas Hope's 'Minor Practicks'—a work which is remarkable for its legal learning, the breadth and boldness of its views, the acuteness of its observations, and the subtlety of its distinctions, but which had lain near a century in manuscript. To this work Bayne added a 'Discourse on the Rise and Progress of the Law of Scotland, and the Method of studying it.' In 1731 he published a small volume of 'Notes,' for the use of the students of the municipal law in the University of Edinburgh, which, framed out of the lectures delivered from the chair, impress us with a favourable opinion of the author's acquaintance with the Roman jurisprudence, as well as with the ancient common law. About the same time he published another small volume, which he entitled 'Institu-

tions of the Criminal Law of Scotland,' for the use of his students. Mr. Bayne held the professorship till his death, which took place in June, 1737.

BAZHENOV, VASSILI IVANOVITCH, an architect distinguished among the native artists of Russia, and first vice-president of the Academy of Fine Arts at St. Petersburg, was born at Moscow, March 1 (13), 1737. While yet a boy he is said to have manifested a decided taste for drawing houses and buildings, which was his favourite amusement, and in which he endeavoured to improve himself by studying the churches, monasteries, and other public structures of that ancient capital. In 1751 he began to attend the School of Architecture at Moscow. Bazhenov was one of the first pupils entered at the Academy of Fine Arts opened at St. Petersburg in 1778. After pursuing his studies there under Tehevakninsky with distinguished success, he was sent to Paris in 1761, where he became the pupil of Duval, and would have obtained the gold medal at the Academy of Architecture but for his belonging to the Greek Church; wherefore in lieu of it he was rewarded by a diploma of merit, signed by the three eminent architects, Leroi, Sufflot, and Gabriel. Proud of his having obtained a distinction such as had never before been conferred on any Russian, the St. Petersburg Academy bestowed on him the degree of 'Adjunct,' and sent him forthwith (October, 1762) to Rome. While in Italy he was elected member of the Academy of St. Luke, and of those of Florence and Bologna.

On his return to St. Petersburg in May, 1765, he was taken into the service of the Empress Catherine, who found him constant employment in various architectural projects and schemes; among others that of erecting upon the site of the Kremlin at Moscow a palace that should surpass every monument of ancient or modern times. In magnitude it certainly would have done so, for the façade would have been upwards of four thousand feet in extent; and some idea may be formed of the pomp and magnificence contemplated by Catherine and her architect from the estimate for the state staircase alone, which was to be entirely of Italian marbles, amounting to five million rubles. Even the model itself, which is still preserved in the Kremlin, cost no less than thirty-six thousand rubles. Nevertheless, although all preparations had been made, and the first stone of the intended edifice was laid with great solemnity on the 1st (13th) of June, 1773, the works were shortly afterwards interrupted, and never resumed.

In 1776 he began for the empress a summer palace, in the gothic style, at Tzariahtino; but Catherine, having withdrawn her favour from Bazhenov, ordered it to be completely altered by Kozakov. Her successor Paul however restored him to his former appointments, bestowed on him an estate with a thousand peasants, lavished various honours upon him, and employed him to erect the palace at Gatchina, that at Pavlovsky, and several government buildings at Cronstadt. But the most magnificent structure which he executed for the Emperor Paul was the St. Michael, or Marble Palace, at St. Petersburg, since converted into a military school for engineers. Bazhenov is also said to have been associated with Voronikhin [ВОРОНИХИН] in building the Kazan church at St. Petersburg. Bazhenov died of paralysis at St. Petersburg, August 2 (14), 1799. He published, 1790-97, a Russian translation of Vitruvius, in 4 vols. 4to.

(Snegirev, *Slovar Ruskikh Pisatelei*.)

BEALE, MARY, an English portrait painter of the 17th century, about whom Vertue collected some interesting details from some journals or pocket-books kept by her husband, of which he saw seven. She was the daughter of the Rev. Mr. Craddock, minister of Walton-upon-Thames, and appears to have been taught painting by Sir Peter Lely. Her husband, Charles Beale, had an employment in the Board of Green Cloth; he was also a painter, and, according to his journals, a colour-maker. The first date concerning her works in his pocket-books is 1672, when Lely's visits to her, and his praises of her copies from Correggio and Vandycck, are noticed. In the same year she painted portraits of the Bishop of Chester, Lord and Lady Cornbury, and Dr. Sydenham, besides others; and she received in that year for paintings 202*l.* 5*s.*

Sir Peter Lely painted for Mr. Beale portraits of Dr. Tillotson and Dr. Stillingfleet, in Mr. Beale's house, in the presence of his wife, in order probably that Mrs. Beale might see his method of painting. Sir Peter (then Mr. Lely) received for the two paintings 30*l.*, of which he took 28*l.* 19*s.* in lakes and ultra-marine. In 1674 Mrs. Beale made 216*l.* 5*s.* by her paintings. A Mr. Manby seems to have painted the landscape backgrounds in some of her portraits, for which he was paid in colours of Mr. Beale's making. In 1677 she received 429*l.* for pictures: a very large amount. Among the portraits of this year were one of the Earl of Clarendon, and others of the nobility. She was paid 5*l.* for a head, and 10*l.* for a half-length in oil. In 1681 Dr. Burnet presented Mrs. Beale with a copy of his 'History of the Reformation.' She appears to have been highly esteemed by the clergy; many distinguished members of that body sat to her. Mr. and Mrs. Beale appear to have been very charitable: from some notes at the end of one of the pocket-books, they gave a tenth part of their income to the poor. Mary Beale died in London in 1697, aged 66. Her husband and two sons survived her. One son, Bartholomew, studied under Dr. Sydenham, and practised as a physician at Coventry; the other, Charles, who was born in 1660, was a painter, and died in London. Her pictures are interesting as portraits

of celebrated personages, but they have little artistic merit. Her portraits of archbishops Tillotson and Tension, and other eminent persons, have been engraved.

BEATON, CARDINAL DAVID, Archbishop of St. Andrews, and Lord High Chancellor to Mary, queen of Scotland, was a younger son of John Beaton or Bethune of Balfour, in the shire of Fife, by a daughter of David Monypenny of Pitmilny, in the same shire; and nephew to Bishop James Beaton, Lord Chancellor to King James V. He was born in 1494, and was, on the 26th of October 1511, matriculated of the University of Glasgow, whence he was sent to France to study the civil and canon laws. On the death of Secretary Panter in 1519 he was appointed resident for Scotland at the French court; and about the same time his uncle the chancellor bestowed on him the rectory of Cambuslang, in the diocese of Glasgow. In 1523 his uncle, now translated from that see to the primacy of St. Andrews, resigned in his favour the rich monastery of Arbroath in commendam, and also prevailed on the pope to dispense with his taking the habit for two years; this time he spent in France, and then returned to Scotland, where he immediately entered parliament as Abbot of Arbroath. On the fall of the Earl of Angus, and the surrender of George, bishop of Dunkeld, he was appointed Lord Privy Seal in 1528, the same year in which the great convent of Blackfriars at Edinburgh, in the immediate neighbourhood of which Beaton and his uncle had their magnificent abode, was burnt down to the ground by a sudden fire. In February 1533, Beaton, now prothonotary apostolic, was sent ambassador to France, with Secretary Erskine, to treat of a league with that crown, and also of a matrimonial alliance with the Princess Magdalene; and when the king of Scots proceeded thither on the same object, Beaton was one of the lords of the regency appointed by commission, 29th of August 1536, to conduct the government in his absence. On Queen Magdalene's decease he was joined in an embassy to the house of Guise, to treat of a match with Mary, widow of the Duke of Longueville. It is probable that when in France, on this occasion, he procured the papal bull of date 12th February 1537, for the erection of St. Mary's College at St. Andrews. In November 1537 he was made a denizen of France, and on the 5th of December he was consecrated Bishop of Mirepoix in Languedoc. On his return home he was made coadjutor in the see of St. Andrews, and successor to his uncle. On the 20th of December 1538, Pope Paul III. advanced him to the cardinalate, by the title of Sancti Stephani in Monte Cælio; and on the 20th of June 1539 the king of France directed new letters of naturalisation in his favour, with a further clause allowing his heirs to succeed to his estate in France, though born and living in Scotland. About this time also we find him 'legatus natus' of the Roman see. On the death of his uncle in the autumn of 1539, he was fully invested in the primacy of St. Andrews, the privy seal being again returned to the Bishop of Dunkeld.

Beaton's authority, zeal, and ability now made him truly formidable; and that he might devote them all to the politics of the church, with consent of the king and pope he devolved his diocesan duties on the dean of Restalrig as his suffragan. On the 28th May 1540 he convened a large assembly of ecclesiastics and others in the cloisters of St. Andrews, and on their conviction of Sir John Borthwick for heresy in holding Protestant opinions, pronounced sentence of outlawry and forfeiture against him, with solemn burning of his effigy at the market-cross of the city. In order to avert the odium which would come upon the clergy if they should continue to execute their own sentences, Beaton induced the king by a large pecuniary payment to appoint a judge in heresy. Accordingly James named Sir James Hamilton, natural brother of the Earl of Arran, to the office, for which his intolerance and ferocity well fitted him, but which he did not long retain, being attainted of treason and beheaded.

On the 20th December 1542 the king died, leaving an infant daughter, eight days old, heir to the throne, but for whose safety or that of the kingdom during her minority he had made no provision. Beaton however produced a testament, which he affirmed was subscribed by his majesty, appointing him regent of the kingdom and guardian to the infant queen. The document was a forgery; and the nobility roused from his inactivity James, earl of Arran, next heir to the queen, and appointed him to the regency. The power however which Beaton failed to obtain directly, he obtained by his address; and not only got the nobles to accede to his views of government, but also induced the timid regent publicly to abjure the doctrines of the Reformation. In December 1543 the great seal was taken from the Archbishop of Glasgow and bestowed on Beaton, whom also, on very strong letters from the regent, Pope Paul III., by bull of 30th January following, constituted his legate 'à latere' in Scotland. Thus he was placed at the head both of church and state, including also the whole civil judicature of the kingdom, being ex officio principal of the Court of Session, the supreme judicatory in civil causes; and as he did not scruple to employ these extensive powers for furthering his own views, he appears to have been held in general abhorrence. The king of England in particular, whose friendship was renounced at the instigation of the cardinal and the popish faction, for an alliance with France, anxiously desired his death; and in the instructions of the English privy council of date 10th April 1544, the Earl of Hertford was especially enjoined, in his inroad into Scotland, not to spare any who were allied to the cardinal either in blood or friendship. Henry soon found in Scotland

spirits congenial with his own; for on the 17th of the same month we find the Earl of Hertford communicating to him a design by Wishart and others to seize or slay the cardinal, could they secure his majesty's protection and support.

Beaton was haughty to all; but to the reformers he was particularly oppressive. In the beginning of 1545-46 he held a visitation of his diocese, and had great numbers brought before him, under the act which had passed the parliament in 1542-43, forbidding the lieges to argue or dispute concerning the sense of the holy Scriptures. Convictions were quickly obtained; and of those convicted five men were hanged and one woman drowned; some were imprisoned, and others were banished. He next proceeded to Edinburgh, and there called a council for the affairs of the church; and hearing that George Wishart, an eminent reformer, was at the house of Cockburn of Ormiston, Beaton instantly moved the sheriff of the county to have Wishart apprehended, which being done, Wishart was carried over by the cardinal to St. Andrews, and shut up in the tower there. The cardinal continued to act with a high hand towards the reformers, and particularly with respect to Wishart. He called a convention of the clergy at St. Andrews, at which Wishart was condemned for heresy, and adjudged to be burnt—a sentence which was passed and put in force by the cardinal and his clergy in defiance of the regent, and without the aid of the civil power. The cardinal afterwards proceeded to the abbey of Arbroath, to the marriage of his eldest daughter by Mrs. Marion Ogilvy of the house of Airlay, with whom he had long lived in concubinage, and there gave her in marriage to the eldest son of the Earl of Crawford, and with her 4000 merks of dowry. He then returned to St. Andrews, where, on Saturday, 29th May 1546, he was put to death in his own chamber by a party of reformers, headed by Norman Leslie, heir of the noble house of Rothes, who, we find, had on the 24th April 1545, given the cardinal a bond of 'manrent' (or admission of feudal homage and fealty), and who had a personal quarrel with the cardinal. The death of Cardinal Beaton was fatal to the ecclesiastical oligarchy, which, under him, trampled alike on law and liberty. Three works of the cardinal's are named—'De Legationibus Suis;' 'De Primatu Petri;' and 'Epistolæ ad Diversos.'

BEATTIE, JAMES, a poet and metaphysician of the 18th century, was born at Lawrencekirk, in the county of Kincardine, Scotland, Oct. 25, 1735. His parents kept a small farm, and were esteemed for a more than ordinary degree of cultivation and intellect. James received his first education at the village school. He entered the Marischal College, Aberdeen, in 1749; and after completing his course of study was appointed in 1753 schoolmaster to the parish of Fordoun, at the foot of the Grampians, six miles from Lawrencekirk. In this solitary abode his poetic temperament was fostered by the grand scenery which surrounded him, and his works evince the zeal and taste with which he studied the ever-changing beauties of nature. He attracted the favourable notice of a neighbouring proprietor, the celebrated Lord Monboddo, with whom he ever after maintained a friendly intercourse. In June 1758 he was elected usher to the grammar-school of Aberdeen, and in 1760, it seems rather by private interest than in consequence of any distinction which he had then attained, he was appointed professor of moral philosophy and logic in the Marischal College.

His first and chief business was to prepare a course of lectures, the substance of which, as they were remodelled by long study and frequent revision, was given to the world in his 'Elements of Moral Science.' His first poetical attempts were published in London in 1760, and received with favour; but most of the pieces contained in this collection (which is now very rare) were omitted by the author's maturer judgment in later editions of his works. Some will be found in the Appendix to Sir William Forbes's 'Life of Beattie.' The same tacit censure was passed by the author upon his 'Judgment of Paris,' published in 1765. In 1762 he wrote his 'Essay on Poetry,' but it was not published, with others of his prose works, until 1776.

In 1767 Beattie conceived the notion of composing his 'Essay on Truth,' written avowedly to confute the moral and metaphysical doctrines advanced by Hume. His motives for engaging in this task are fully detailed in a long letter to Dr. Blacklock (Forbes's 'Life,' vol. 1, p. 129), and they do credit to his sincerity and courage. If Beattie could not quite attain his own wish of being "animated without losing his temper," something must be conceded to his deep feeling of the importance of the subjects in dispute. The 'Essay' was received with much anger by Mr. Hume and his friends, as a violent and personal attack; and that Beattie's zeal might require some tempering we may conclude from knowing that an intended preface to the second edition (published early in 1771) was cancelled by the advice of some of his best friends. His work appeared in May 1770 under the title, 'Essay on the Nature and Immutability of Truth, in opposition to Sophistry and Scepticism.' The 'Essay on Truth' was only the first part of an intended discourse on the evidences of morality and religion. Habitual ill health, and an avowed dislike to severe study, prevented Dr. Beattie from completing his design.

The first canto of the 'Minstrel,' which had been commenced in 1766, but laid aside on account of ill-health and more pressing avocations, was published anonymously in 1771. It was most favourably received by the public, and warmly praised by Gray, whose commendation was the more valuable because accompanied by a letter of minute criticism. In the same year Beattie visited London for the

first time since he had been known as an author, and received distinguished and flattering notice from Dr. Johnson and the best literary society of the metropolis.

In 1773 Beattie again visited London, and owing to the powerful interest which was exerted on his behalf, he obtained a pension of 200*l.* The king (George III.) received him with distinguished favour; and the University of Oxford conferred on him the honorary degree of D.C.L. During this visit, Sir Joshua Reynolds painted and presented to him the well-known portrait, which contains the allegorical triumph of Truth over Sophistry, Scepticism, and Infidelity. In the same autumn the chair of moral philosophy in the University of Edinburgh becoming vacant, it was offered to Dr. Beattie, but he declined it for the sake of peace and quiet. At this time he was engaged in finishing the second book of the 'Minstrel,' which was published in the following spring.

Several eminent persons, with some of Beattie's personal friends, were desirous to induce him to take orders in the English church, and more than one living was pressed upon his acceptance. In 1774 he received the offer of a living worth near 500*l.* per annum, from Dr. Thomas, bishop of Winchester. Beattie took these proposals into serious consideration, but eventually he refused them, mainly on the ground that his acceptance might give a handle to the opponents of revealed religion for asserting that the 'Essay on Truth' was written for the sake of preferment.

The 'Essay on Truth' was re-published in 1776, with three other essays:—'On Poetry and Music, as they affect the Mind;' 'On Laughter and Ludicrous Composition;' 'On the Utility of Classical Learning.' These were followed at intervals by other essays and dissertations, chiefly taken from his academical lectures:—'Dissertations Moral and Critical, on Memory and Imagination, on Dreaming, on the Theory of Language, on Fable and Romance, on the Attachments of Kindred, and Illustrations of Sublimity,' 1783; 'Evidences of the Christian Religion,' 1786; 'Elements of Moral Science,' vol. i. containing 'Psychology and Natural Theology,' 1790; vol. ii. containing 'Ethics, Economics, Politics, Logic, and a Dissertation on the Slave Trade,' 1793. But he appears to have engaged in no new investigations or studies; and his letters explain the cause of this to have been ill-health, and consequent disinclination to labour, aggravated by mental depression, and a considerable share of domestic disquiet, produced by an hereditary disposition to insanity in his wife. His life passed until 1790 without marked events, in the discharge of his academical duties; varied in his long summer vacations by not unfrequent visits to London, and to many persons eminent by their talents or rank, who sought his society for the sake of his powers as a companion, as much as for his reputation. In 1790 he suffered an irreparable loss in the death of his eldest son at the age of twenty-two, a young man of great promise; and his declining health received another shock in 1796 in the unexpected death of his only surviving son after a week's illness, in the eighteenth year of his age. He said, in looking on the corpse, "I have now done with the world," and he never again applied to study of any sort. The closing years of his life exhibit a melancholy scene of gloom and distress, bodily and mental. He was struck by palsy in April 1799, and after one or two subsequent attacks, expired August 18, 1803.

In the relations of private life, and in his public duties as a teacher, Dr. Beattie was most estimable; and he commanded, in an unusual degree, the esteem and affection of his pupils, as well as of a large circle of friends. It is honourable to him, that long before the abolition of the slave trade was brought before parliament, Beattie was active in protesting against that iniquitous traffic; and he introduced the subject into his academical course, with the express hope that such of his pupils as might be called to reside in the West Indies would recollect the lessons of humanity which he inculcated.

Of his writings, the 'Minstrel' is that which now probably is most read. It is not a work of any very high order of genius; but it exhibits a strong feeling for the beauties of nature; and it will probably long continue to hold an honourable place in the collections of minor poetry. Beattie's metaphysical writings have the reputation of being clear, lively, and attractive, but not profound. The 'Essay on Truth' was much read and admired at the time of its publication, but has fallen into comparative neglect, with the doctrines against which it was especially directed.

(*Life of Dr. Beattie*, by Sir W. Forbes.)

BEAUFORT, CARDINAL. Henry Beaufort, Bishop of Winchester and Cardinal of St. Eusebius, was a son of John of Gaunt, duke of Lancaster (father of Henry IV.), by his mistress Catherine Swynford, whom he subsequently married. His children by this woman, all born before wedlock, were legitimated by the name of Beaufort in the twentieth year of the reign of Richard II. We are unable to state the exact year of Cardinal Beaufort's birth; but it was probably about the year 1370. He studied at Oxford, Cambridge, and Aix-la-Chapelle. In 1397 he was created bishop of Lincoln; became chancellor of the University of Oxford in 1399; and in 1404 succeeded the celebrated William of Wyckham as bishop of Winchester. In the parliaments of 1404 and 1405 he officiated as lord chancellor, an office which he filled four times during his life. The bishopric of Winchester was then, as at present, one of the richest endowments in the English church; and Beaufort, from habits of frugality according to some writers, from

covetousness according to others, multiplied his riches so as to become the wealthiest subject in England. He advanced to his nephew, Henry V., by way of loan, out of his own private purse not less than 28,000*l.* during his wars in France; and also lent the infant king, Henry VI., 11,000*l.*, sums which at that period were of enormous magnitude.

On the death of Henry V. in 1422, Beaufort (with his brother, afterwards Duke of Exeter) was appointed guardian of his infant successor: Beaufort was also a member of the council of regency, of which the king's uncle, Humphrey, duke of Gloucester, was the nominal head. The struggle for supremacy between these ambitious men, which soon assumed the character of a fierce personal contest, is the most prominent feature of the internal history of England from the year 1424 to the year of their death, in 1447. The prelate ultimately triumphed in the struggle, which on more than one occasion threatened to inflict upon the country all the ills of civil war. In 1426, in the absence of the regent, Bedford, the quarrels of Beaufort and Gloucester nearly issued in bloodshed in the city of London. But the Archbishop of Canterbury, and the Prince of Portugal, who happened to be in England at the time, prevailed on the two parties to suspend their strife till the regent should return to England. The Duke of Bedford hastened from Paris to reconcile the rivals, but found it expedient to refer the matter to a parliament summoned for the purpose at Leicester. This parliament is known by the nickname of the "parliament of bats," a nickname which, in its origin, aptly illustrates the temper of the partisans of the bishop and of Gloucester, and throws some light on the then state of manners. In order to prevent the consequences of strife among armed men, the members of the parliament summoned at Leicester were ordered to leave at their inns their swords and other weapons usually worn by the gentry at that period: their followers however with a view of defeating this prohibition, attended them with 'bats,' or clubs, on their shoulders; and when these also were forbidden they concealed stones and plummets of lead in their sleeves and bosoms. ('Parliamentary History,' vol. i. p. 354.)

Among other charges put forward by the Duke of Gloucester, in a bill of impeachment against his uncle Beaufort, was an accusation that he had hired an assassin to take away the life of the late king Henry V., at the time Prince of Wales; and that he had encouraged the prince to usurp the throne before the death of his father. Gloucester professed to make this charge on the authority of Henry himself; but the bishop triumphantly opposed to that testimony the fact that Henry had, to the last moment of his life, honoured him with his friendship and confidence. After much wrangling and recrimination, the matter was referred to the arbitration of four spiritual and four temporal peers, who awarded that Gloucester should be "good lord to the bishop, and have him in affection and love," and that the prelate should preserve to the duke "trew and sad love and affection, and be ready to do him such service as pertaineth of honesty to my Lord of Winchester and to his estate to do." A formal public reconciliation then took place between the two disputants; but the bishop felt the award to be so much of a reproof, that he resigned the chancellorship, and obtained leave to go abroad. Beaufort accompanied Bedford in his return to France; and at Calais received the welcome intelligence that the pope had raised him to the dignity of cardinal, and had appointed him legate 'à latere,' for the purpose of directing an English force in a crusade against the Hussites in Bohemia. [BEDFORD, DUKE OF.]

In 1429 Cardinal Beaufort succeeded in destroying the power of his rival Gloucester, by having the young king crowned, and by inducing the parliament to declare on the occasion that the office of protector, filled by the duke, was, ipso facto, at an end. From being at the head of the council of regency, Gloucester was thus reduced to his rank as a peer. From this time till his death the councils of the cardinal predominated in the administration.

A powerful party however, headed by the Duke of Gloucester, opposed itself to the administration of the cardinal. The spirit of the age was averse to the rule of ecclesiastical statesmen; and the House of Commons in particular had directed its attention to the question of church reform, as essential to good government. In a meeting of peers, in 1431, it was proposed that, as the dignity of cardinal was, by the law of the land, incompatible with the possession of a bishopric in England, Beaufort should be removed from the see of Winchester, and compelled to refund its revenues from the day that he had accepted the cardinal's hat. Gloucester followed up this motion with a series of charges, to the effect that Beaufort had incurred the penalties of præmunire in having accepted the papal bull, contrary to the express prohibition of the late king, and had exempted himself as legate from the jurisdiction of the see of Canterbury. The same charges were renewed in a more formal manner by Gloucester in 1434. He accused the cardinal also of having amassed wealth by dishonest means, of having usurped the functions of sovereignty, appointing embassies, and releasing prisoners on his own authority, and estranging from the person of the young king his relatives and the council of the regency. The cardinal, although too powerful to be now reached by Gloucester's accusation, deemed it prudent to obtain two acts of parliament, one in 1432, the other in 1437, indemnifying him against the penalties of præmunire, and pardoning him for all crimes committed up to the 20th of July in the last-named year. The arrest and probable murder of Gloucester are usually ascribed to his fierce and

courageous denunciation of the ecclesiastical counsellors of the king. Gloucester's death took place on the 28th of February, 1447.

The cardinal survived his great rival but six weeks. His death-bed has been painted in immortal colours by Shakspeare ('Henry VI.,' part 2), but the imagination of the poet has supplied the darkest features of the picture. Shakspeare represents him as expiring in an agony of despair:—

"Lord Cardinal, if thou think'st on heaven's bliss,
Hold up thy hand, make signal of thy hope,—
He dies, and makes no sign."

But we know from the authority, Hall, which Shakspeare has followed in the less harrowing details of the scene, that the cardinal's worldliness was confined to expressing his regret that money could not purchase life, and that death should have cut him off at the moment when his rival to the great object of his ambition (the popedom) had been removed. Hall's version is given on the authority of one Baker, the cardinal's chaplain; and the last words are, "I pray you all to pray for me." His will, moreover, to which two codicils are attached, on the 7th and 9th of April (he died on the 11th), is still extant (Nichols's 'Royal and Noble Wills,' p. 311), indicating a state of feeling more worthy of a Christian prelate. His great wealth was distributed, according to the provisions of his will, in charitable donations. Not less than 4000*l.* was allotted for the relief of the indigent prisoners in Newgate, Ludgate, the Fleet, Marshalsea, King's Bench, and the prison attached to the Southwark manor of the diocese of Winchester; and the hospital of St. Cross at Winchester still exists as a monument of his munificence. Cardinal Beaufort was buried in the beautiful chantry which bears his name in Winchester Cathedral.

BEAUFORT, LOUIS DE, was born of a French family, settled in Germany or Holland, as far as we may presume from the scanty information we can find of his early life. He was for a time tutor to the young prince of Hesse Homburg, but he became known to the learned world by his 'Dissertation sur l'incertitude des Cinq Premiers Siècles de l'Histoire Romaine,' 8vo, 1738. He was one of the first modern writers who carried the spirit of critical investigation into the narrative of the first five centuries of the Roman commonwealth; he showed that both Livy and Dionysius could not be implicitly trusted, and that it required a process of very acute and careful discrimination to separate the truth from the legendary fables of early Roman history. Among other things he maintained that Porsenna did really conquer Rome after the expulsion of Tarquinius. Niebuhr remarks, when speaking of Beaufort's 'Dissertation' (vol. i. p. 539, note), "that the critical examination of this war is the most successful part of that remarkable little work." His next work was 'La République Romaine ou Plan Général de l'Ancien Gouvernement de Rome,' 2 vols. 4to, La Haye, 1766. The author treats at length and systematically of the institutions of Rome; of its senate, its populus and plebs, its comitia, its consuls and tribunes; of the laws and tribunals, of the religion of the country and its ministers, of the various classes of society and their respective rights, and the condition of the allies and subjects of Rome. This work met with great approbation, and maintained its ground as one of the best works upon the Roman republic previous to Niebuhr's 'History of Rome.' He wrote also 'Histoire de Germanicus,' 12mo, 1741, which he dedicated to the Landgrave of Hesse Homburg. Beaufort was a member of the Royal Society of London. He died at Maestricht in 1795.

BEAUFORT, MARGARET, COUNTESS OF RICHMOND AND DERBY, is entitled to honourable mention as an eminent patroness of literature, after the manner of the age in which she lived. She was of royal descent, being the daughter and heiress of John Beaufort, duke of Somerset, grandson of John of Gaunt, duke of Lancaster, third son of Edward III. Margaret Beaufort was born in 1441, and was thrice married: first to Edmund Tudor, half-brother to Henry VI., created Earl of Richmond, by whom she had one son, afterwards Henry VII.; secondly to Sir Henry Stafford, a younger branch of the ducal house of Buckingham; thirdly to Lord Stanley, afterwards earl of Derby. By the two last marriages she had no issue. She died in 1509, and is buried at Westminster, where her tomb may be seen in the south aisle of Henry VII.'s chapel.

The Countess of Richmond was rich, pious, charitable, and generous. Her attention to the formal observances of religion prescribed by the Papal Church was strict even to rigour. To her bounty Christ's College, Cambridge, founded in 1505, and St. John's College, Cambridge, projected and endowed by her, but not chartered till 1511, owe their existence. The estates which she left to St. John's College were sued for and recovered by Henry VIII. as the heir-at-law of Margaret Beaufort, and the wealth which this distinguished college now enjoys is chiefly due to the liberality of later benefactors. The Countess of Richmond established a professorship of divinity, with a salary of 20 marks, in each university, the holders of which are called Lady Margaret's professors. She also appointed a public preacher at Cambridge, with a salary of 10*l.*, whose duties are now confined to the delivery of one Latin sermon yearly.

Walpole has given this lady a place in his 'Catalogue of Royal and Noble Authors,' as the translator of two books:—1. 'The Mirroure of Golde to the Sinfull Soule,' translated from a French translation of the 'Speculum Aureum Peccatorum,' printed by W. de Worde in 1522; 2. Translation of the fourth book of Dr. J. Gerson's 'Treatise on the

Imitation and Following the Blessed Life of our Most Merciful Saviour Christ,' printed at the end of Dr. William Atkinson's translation of the three first books—Pynson, 1504.

BEAUHARNAIS, EUGÈNE DE, son of Viscount Alexandre de Beauharnais, was born at Paris September 3, 1781, and received his early education at the college of St. Germain-en-Laye. His father was a member of the National Assembly, in which he embraced the popular side, and afterwards served with distinction in the army of the Rhine in 1792. He was however accused by the Jacobins, taken before the revolutionary tribunal, condemned, and beheaded in July 1794, when he was only 34 years of age. His widow Josephine married in 1796 Napoleon Bonaparte, who treated her children, Eugène and Hortense, as if they had been his own. Eugène accompanied Bonaparte to Italy, and afterwards in 1798 to Egypt, where he acted as his aide-de-camp. After Bonaparte became first consul Eugène was made chef-d'escadron in the Consular Guards, in which capacity he was present at the battle of Marengo. In 1804 he was made colonel-general of the Chasseurs of the Guards. When Bonaparte became emperor, Eugène was created a prince of the new empire; and in 1805, on being appointed viceroy of the (so called) kingdom of Italy, which comprised Lombardy and the northern papal provinces, he fixed his residence at Milan. He was adopted by Napoleon in January 1806, and soon after married Augusta Amelia, daughter of the king of Bavaria. In 1809, when war broke out again between Austria and France, Eugène took the command of the French and Italian army on the frontiers towards Carinthia, but he was obliged to retire before the superior forces of the Archduke John; and after sustaining considerable loss from the the Austrians at the battle of Sacile on the river Livenza, he withdrew to the banks of the Adige, where he received reinforcements. Upon the defeat of the great Austrian army in Germany, the archduke marched back for the protection of Vienna, and was closely followed by Eugène. A battle took place between the two armies near the river Piave, where the Austrians were worsted, and obliged to hasten their retreat. Eugène followed them through Carinthia and Styria, and on the 27th of May made his junction with Napoleon's grand army at Ebersdorf, near Vienna. He was thence sent into Hungary to check the rising *en masse* of the people of that country. On the 14th of June he defeated the Archduke John at Raab in Hungary.

The battle of Wagram in July following put an end to the war. After the peace of Vienna Eugène returned to Milan, whence he repaired to Paris in December 1809 to be present at the declaration of divorce between his mother and Napoleon. He made a speech to the senate, in which he dwelt on the duty of obedience to the will of the emperor, to whom he and his family were under great obligations. In 1812 he joined Napoleon in the campaign of Russia with part of the Italian army, during which service he took the command of the fourth corps of the grand army, and was engaged at the battles of Mohilow and of the Moskwa. In the disastrous retreat from Moscow, Eugène succeeded in keeping together the remnants of his own corps, and maintaining some order and discipline among them; and after Napoleon and Murat had left the army, he took the command of the whole. At Magdeburg he collected the relics of the various corps; and on the 2nd of May, at the battle of Lutzen, he commanded the left of the new army which Napoleon had raised. Soon after he returned to Milan to raise new conscriptions to replace the soldiers who had perished in Russia, and to make every effort to defend Italy against the threatened attack of Austria. Three levies of 15,000 conscripts each were ordered in the course of one year in the kingdom of Italy alone; but the people were tired of war, and it was found difficult to collect the men. The news of the battle of Leipzig added to the general discontent; and at the end of October 1813 the Austrian army entered the Venetian territory, when Eugène was obliged to retreat to the Piave, and, after some sharp fighting, to fall back on the Adige. In March 1814, being attacked by the Austrians on one side and by Murat at the head of the Neapolitan army on the other, he withdrew to the Mincio, and removed his family and property from Milan to the fortress of Mantua. On the 16th of April Eugène and Marshal Bellegarde, the Austrian commander, signed the convention of Schiarino-Rizzino, by which hostilities were suspended, the French troops remaining in Italy were sent away, and Venice, Legnago, and other fortresses, were delivered up to Austria. Napoleon's kingdom of Italy was now at an end, and Napoleon himself had abdicated the crown of France. Some endeavours were made by Eugène's friends to obtain his nomination as king of Lombardy, but a strong party at Milan violently opposed it; and an insurrection took place in that city in which Prina, one of Prince Eugène's ministers, was murdered by the people. Upon this Eugène gave up Mantua to the Austrians, and returned with his family to Bavaria.

As viceroy of the kingdom of Italy, Eugène was personally liked by the people and by the army, for his frank bearing and affable temper, and his humane disposition. Entirely devoted to Napoleon, he implicitly obeyed and enforced his often harsh decrees, although he occasionally endeavoured to obtain some mitigation of them. He displayed activity and regularity in the details of administration; his viceregal court was splendid, but he was frugal in his own expenditure. But some of the persons by whom he was surrounded were objects of popular aversion, and thus occasioned an unfavourable feeling towards Eugène's government.

After leaving Italy Eugène lived chiefly at Munich, at the court of his father-in-law, with the title of Prince of Louchtenberg. He visited Paris after the death of his mother, and was very graciously received by Louis XVIII. He also visited Vienna when the Congress was sitting, and was treated with marked attention by the allied sovereigns and their ministers, but especially by the Emperor Alexander. Eugène retained, with the consent of the pope, the possession of some estates in the northern provinces of the Roman states, which had formed part of the kingdom of Italy. The restored king of Naples also agreed to pay him five millions of francs. These grants were intended as a compensation for the loss of the yearly income of a million of francs assigned to him by Napoleon on the national domain of Italy. (Colletta, 'Storia del Reame di Napoli,' vol. iv.) Eugène died at Munich on the 21st of February 1824, at the age of 43 years. Eugène left two sons and four daughters: the eldest son, Auguste Charles, married Donna Maria, the late Queen of Portugal, and died in 1835; the other son, Maximilian Joseph, married the Archduchess Olga, daughter of the Emperor Nicholas of Russia, and died in 1852; the eldest daughter Josephine is Queen of Sweden, having married in 1823 Oscar, the present king of Sweden; the second daughter, Eugénie Hortense, married Frederick, the prince of Hohenzollern-Hechingen, and died in 1847; and the third, Amélie Auguste, is the widow of Don Pedro, late emperor of Brazil.

BEAUMARCHAIS, PIERRE AUGUSTE CARON DE, was born at Paris in January 1732. His father was a watchmaker, and brought up his son to the same profession, in which young Beaumarchais showed considerable skill. He was also remarkably fond of music, and attained great proficiency in playing on the harp and the guitar. Beaumarchais played before the daughters of Louis XV., who being pleased with his musical skill admitted him to their concerts, and afterwards to their parties. He now appeared at Versailles in a rich court-dress, which offended a haughty nobleman, who meeting him one day in one of the galleries, asked him abruptly to look at a valuable watch that he wore, which was out of order. Beaumarchais excused himself, by saying that his hand was very unsteady; the other insisting, Beaumarchais took the watch and dropped it on the floor, simply observing: "I told you so." Notwithstanding this event he continued to enjoy the patronage of the court, which gave him the opportunity of becoming connected with some of the Fermiers Généraux and great contractors. He became involved in several lawsuits, and gained considerable notoriety in consequence of the memoirs or pleadings of his case, which he wrote and published. These pleadings, which show considerable skill and oratorical power, are inserted in the collection of his works. But his fame as a writer rests on his plays, and chiefly on the well-known operas 'Le Barbier de Seville,' and 'Le Mariage de Figaro.' The character of Figaro was a happy invention, and the other principal characters, in both plays, are drawn with great skill. The 'Mariage de Figaro' alone produced Beaumarchais 80,000 francs. He also wrote 'La Mère Coupable,' which may be considered as a sequel to the other two, but is very inferior to them, 'Eugénie,' and 'Les Deux Amis.' At the beginning of the revolt of the English-American provinces, Beaumarchais entered into a speculation for supplying the colonies with arms, ammunition, &c.; and although he lost several vessels the greater number arrived in America, and Beaumarchais enriched himself by his undertaking. When the French revolution broke out, Beaumarchais showed himself favourable to the popular cause, and entered into speculations to supply corn, muskets, &c. But his activity in that critical period exposed him to suspicion; he was accused and acquitted, then accused again, and being obliged to run away, he escaped to England and afterwards to Germany. He returned to France after the fall of Robespierre. He died in May 1799.

Beaumarchais had considerable talent, and many good qualities, but he was very vain and fond of distinction. He undertook an edition of all the works of Voltaire, of whom he was a great admirer; but the edition, notwithstanding all his pains and great expense, proved very indifferent, both as to correctness and execution.

(*Œuvres complètes de Beaumarchais*, 1 vol. 8vo, Paris, 1809; *Dictionnaire Universel Historique*.)

BEAUMONT, FRANCIS, the dramatist, third son of Francis, one of the judges of the Court of Common Pleas, and of Anne, daughter of George Pierrepont, of Holme-Pierrepont, in the county of Nottingham, was born at the family seat of Grace Dieu, in Leicestershire, 1586. The Beaumonts were not only an ancient stock, but some of them sought to trace their lineage to the kings of France and of England. The glory of the family however consists in its literature.

At ten years of age Beaumont was admitted a gentleman-commoner at Broadgate's Hall, now Pembroke College, Oxford. He afterwards became a student in the Temple; married Ursula, daughter and co-heir of Henry Isley, of Sundridge, in Kent, by whom he had two daughters; died before he was thirty, in the spring of the year 1615; and was buried at the entrance of St. Benedict's Chapel, in Westminster Abbey, without any inscription. One of the daughters of Beaumont, Frances, was living at a great age in 1700, at which time she enjoyed an annuity of 100*l.* from the Duke of Ormond, in whose family she had resided (say the biographers) as a "domestic;" by which is meant, perhaps, a companion.

The race of the Beaumonts, like that of the Fletchers, which is an

interesting coincidence, appears to have abounded in the love of poetry. The biographers have noticed that there were four Francis Beaumonts all living in 1615, and that at least three of them were poets—Francis the dramatist; Francis, his cousin, master of the Charter House; and Francis, a 'Jesuit,' probably a son of the dramatist's elder brother Sir John, who though perhaps too young to be a Jesuit at that time, became one after his father's death. This Sir John Beaumont, author of 'Boisworth Field,' was a poet of real merit; his son and successor, another John, inherited his poetical tendency. Dr. Joseph Beaumont, master of Peter House, Cambridge, who lived in the time of the Charleses, and was of a branch of the family, though son of a wool-stapler in Suffolk, is also known to poetical antiquaries as one of the writers from whom Pope thought a man might "steal wisely."

As the life of Francis Beaumont was so short, and his writings apparently so numerous, it cannot be supposed that he paid much attention to the law. He probably gave himself up to the literature and amusements of the town. He records, in a celebrated epistle, his intimacy with Ben Jonson, and the other men of genius who assembled at the Mermaid Tavern; where he says, they used to leave an air behind them, sufficient to make the two next companies witty. At this great set of all literary clubs, he would meet with Shakspeare; and perhaps it was here he became acquainted with the illustrious friend with whom he was destined to become all but identified. The date of their first play is 1607, when our author was one-and-twenty. Fletcher was ten years older. If we may credit Aubrey, their connection was, in every respect, singularly close. They lived in the same house, and in most respects had their possessions in common. The friendships of that age were of a more romantic cast than at present. Its poetry fell with more vigour into the prose of common life, and tintured the whole stream.

A natural curiosity has existed, to know what were the distinguishing characteristics of the portions furnished to their common writings by these illustrious friends. It has generally been believed that Fletcher contributed the vivacity, and Beaumont the judgment. We can discover no foundation for this opinion, except the report; and suspect that there never was any. "I have heard," says Aubrey, "Dr. John Earle (since Bishop of Sarum) say, who knew them, that his (Beaumont's) main business was to correct the overflowings of Mr. Fletcher's wit." Yet Earle, in his verses upon Beaumont, expressly attributes to him whole plays, in which his genius is quite as exuberant as Fletcher's. Their editors in general are divided as to the property; tradition seems to have distributed it between them at random; and Mr. Seward, in an elaborate attempt to discriminate it, bewilders himself in refinements which end in giving them each other's qualities interchangeably, and protesting against his own distinction. If the miscellaneous poems attributed to Beaumont be his, especially the 'Hermaphrodite,' (which Cleaveland claimed as a joint composition of himself and Randolph,) there would be reason to suspect that his genius was naturally more exuberant than Fletcher's: and judging from the works which they are known to have produced separately, such as the 'Faithful Shepherdess,' the 'Masque,' and the 'Epistle,' there appears to be nothing to forbid the conclusion that each might have written either; except, indeed, that in the only undramatic copy of verses extant in Fletcher's name ('Upon an Honest Man's Fortune'), his muse is the graver of the two. We are therefore inclined to think, that the reason which Aubrey gave for their strong personal attachment, applies with equal force to this question: "There was a wonderful consimilitude of phantasy," he says, "between him (Beaumont) and Mr. John Fletcher, which caused the deareness of friendship between them." They loved one another fully and entirely, and exhibited the only great spectacle existing of two men writing in common, and puzzling posterity to know which was which, precisely because their faculties were identical.

Another, and apparently more perplexing difficulty remains, in the wonderful praises lavished by the writers of those times upon the decency and chastity of a muse, which to our eyes appears the strangest mixture of delicate sentiment and absolute prostitution. Beaumont and Fletcher are the dramatists of all others whom a liberal modern reader could the best endure to see in a castigated edition. Their ideas are sometimes even as loathsome as they are licentious. Schlegel has expressed his astonishment, how two poets and gentlemen could utter the things they do, nay, whole scenes; in some measure, whole plays; and Dryden, who availed himself in his dramas of all the licence of the time of Charles II., said, in defending himself on that point, that one play of Beaumont and Fletcher's (the 'Custom of the Country') contained more indecency than all his put together. Yet these are the writers whom their contemporaries, including divines as well as fine gentlemen, compliment in the most emphatic manner upon their decorum and purity. Harris, then or subsequently Greek professor at Oxford, and called a second 'Chrysostom,' panegyricises their muse for being 'chaste.' Dr. Maine, celebrated for his piety as well as wit, speaks of their 'chaste scene;' Sir John Birkenhead says that Fletcher (who was son of a bishop) wrote

"As if his father's crosier awed the stage;"

and Dr. Earle (afterwards a bishop himself), not content with declaring that Beaumont's wit is 'untainted with obscenity,' protests that his writings are too 'pure,' and 'chaste,' and 'sainted,' to be called plays.

The solution of this mystery gives us an extraordinary idea of such

plays of the time as have not come down to posterity, and of the distinction drawn by our ancestors between licence of speech and conduct; for the panegyric appears to be almost wholly founded upon the comparative innocence of double meanings.

"Here, ye foul speakers, that pronounce the air
Of stews and sewers,"

cries the gallant Lovelace, the Sir Philip Sydney of his day, speaking of the very comedy above-mentioned,—

"View here a loose thought said with such a grace,
Minerva might have spoke in Venus' face;
So well disguis'd, that 'twas conceived by none,
But Cupid had Diana's linen on;"

and so he goes on, objecting nothing to the thought, but holding the example to be spotless, and desiring it to spread, as if for its own sake. It thus appears that other writers used language,—homely words, or grosser images,—such as Beaumont and Fletcher never uttered; and if it were objected that Shakspeare, as well as several other dramatists, did not allow themselves a twentieth part of the licence even of Beaumont and Fletcher, the reply would be, that the accomplished duumviri more expressly set themselves to represent the manners and conversation of high life and the town elegance, and that their ingenuity in avoiding cause of offence was therefore the more singular and meritorious.

Beaumont and Fletcher were two open-hearted men and genuine poets, spoilt by town breeding and the love of applause. It is a pity that two such poets could have been so spoilt; but still, in the best part of their genius, they survived the contamination, strong in their sympathy with the great nature that bestowed it, and "pure in the last recesses of the mind." Even the purest characters in their plays are not free from an intermixture of things which they ought not to know or talk about; while the practical chastity is overwrought, and put to absurd and gratuitous trials, as if there could be no faith in it but from the most extravagant proof. In short, a something not entirely true to nature pervades almost all their writings, running side by side with the freshest and loveliest passages; and while one half of a scene, or sometimes of a speech, or even a couple of sentences, gushes out from the authors' heart, the other is brought from some fantastic fountain of court manners and talk, and produced for the sake of town effect.

Although this unwholesome and objectionable matter pervades their writings, there might be formed from the works of Beaumont and Fletcher a selection of passages of as refined sentiment, lofty and sweet poetry, excellent sense, humour and pathos, as any in the language, excepting Shakspeare and Chaucer. Nothing can surpass the tender delicacy of the page's scenes in 'Philaster,' the dignified sentiment in the 'Elder Brother,' the wit and happy extravagance in the 'Woman Hater' and the 'Little French Lawyer,' the pastoral luxuriance in the 'Faithful Shepherdess,' or the exquisite and virgin poetry scattered throughout the whole collection, sometimes in the midst of the most artificial and even disgusting passages. In lyrics they have scarcely an equal, even in Shakspeare himself, or Milton: their lyrical compositions sing their own music.

BEAUMONT, SIR GEORGE HOWLAND, was the seventh baronet of the ancient family of the Beaumonts of Stoughton Grange, Leicestershire. He was born in 1753, was educated at Eton, a distinguished amateur of the arts and friend of artists, possessed himself considerable skill as a landscape painter, and was one of the most munificent donors to the British national collection of pictures. He was mainly instrumental in the establishment of the National Gallery; in furtherance of which object he promised to contribute part of his own collection at Coleorton Hall: he accordingly presented to the National Gallery sixteen paintings, chiefly landscapes—a landscape and figures by Nicolas Poussin; Hagar and the Angel, Narcissus and Echo, the Death of Procris, and a study of trees, by Claude; a view of Venice by Canaletto; a large landscape and figures by Rubens; a landscape and figures by Both, called Morning; a landscape and figures, called the Return of the Ark, by Sebastian Bourdon; the Villa of Mæcenas, and the Niobe, of Wilson; a portrait of a Jew, and a sketch of the Descent from the Cross, by Rembrandt; a profile of a man by Sir Joshua Reynolds; Pylades and Orestes by West; and the Blind Fiddler by Wilkie. Sir George was one of Wilkie's earliest patrons and best friends. There are also two of his own landscapes in the National Gallery—a small piece on wood, and Jacques contemplating the Wounded Stag, from 'As you like it.' These two pictures were presented by Lady Beaumont after the death of Sir George. He died in February 1827 without issue. Lady Beaumont, who was the granddaughter of Lord Chief Justice Willes, survived Sir George little more than two years; she died in July 1829.

BEAUSOBRE, ISAAC, was born in 1659 at Niort, in the province of Poitou. His ancestors, being Protestants, had emigrated from France at the time of the St. Bartholomew massacre, but returned afterwards in consequence of the edict of Nantes. Young Beaubre studied at Saumur, was afterwards ordained, and took charge of the Protestant church of Châtillon-sur-Indre, in Touraine. When Louis XIV. renewed the persecution against the Protestants, by the revocation of the edict of Nantes, in 1685, the church of Châtillon was closed, and the gates sealed by the king's officers.

Beausobre broke the seals, and preached as usual on the Sunday, in consequence of which he was obliged to take refuge in Holland. From Holland he went to Dessau, in 1686, as chaplain to the Princess of Anhalt-Dessau. His first work was 'Défense de la Doctrine des Réformés,' Magdeburg, 1693. In 1694 he removed to Berlin, and took charge of one of the French Protestant churches in that capital. He was afterwards made chaplain to the court, inspector of the French college, &c. He enjoyed the favour of the king, Frédéric William I., whose son, the Crown Prince, afterwards the Great Frédéric, also conceived great regard for him. Beausobre passed the remaining forty-six years of his life at Berlin, where he died in June 1738, much regretted, both on account of his personal character and his extensive learning. He wrote numerous works, the principal of which is his 'Histoire critique de Manichéisme et du Manichéisme,' 2 vols. 4to, 1734-39. The first part of this work is historical: the author derives his account of Manes, or Mani, from Syrian, Persian, and Arabic authorities, and exhibits the great discrepancy existing between their narratives and those of the Greek and Latin writers. The second part treats of the doctrines, rites, church discipline, and morals of the Manicheans. The work is full of varied and interesting erudition. The second volume was edited by Formey after Beausobre's death, with a short biography of the author by the editor. Beausobre undertook, with L'Enfant, a French version of the New Testament from the Greek text, which contains a long and valuable introduction, and numerous explanatory notes: 2 vols. 8vo, Amsterdam, 1718, reprinted in 1741. The introduction was translated into English, 1726. He also began a history of the Reformation on a very large scale, which he left in an imperfect state. It was published at Berlin in 1755, in 4 vols. 8vo. In conjunction with other literary men, he began the journal and review called 'Bibliothèque Germanique,' the first volume of which appeared in 1720, and which was carried to the fiftieth volume. Beausobre continued to the last to be one of the principal contributors, and wrote nearly half of each volume. A sequel to this work was begun after Beausobre's death by Mr. Formey, under the title of 'Nouvelle Bibliothèque Germanique.' Beausobre wrote also 'Remarques critiques et philologiques sur le nouveau Testament,' published after his death at La Haye (the Hague), 2 vols. 4to. His 'Sermons' were published in 4 vols. 8vo. Beausobre left several other works in manuscript, complete and incomplete, especially on the various sects of the dark ages, the Paulicians, the Albigenes, &c.

BEAUVOIS, AMBROSE MARIA FRANCIS JOSEPH PALISOT DE, a celebrated French naturalist and traveller, was born at Arras on the 27th of July 1752. His father, who was an advocate, educated him for the legal profession; but his bias for the study of natural history was so strong that from an early age he was more frequently in the fields with his friend and preceptor Lestiboudois than in the courts of law. In the year 1772 he was appointed receiver-general of crown rents, which he held for about five years. Upon the suppression of this office in 1777, he appears to have abandoned his profession, and to have determined upon devoting himself exclusively to his favourite pursuits. The French government had planned an expedition to the west coast of Africa, for the purpose of founding a settlement which might serve as a counterpoise to the mercantile influence of the English in that part of the world. Palisot de Beauvois eagerly embraced what appeared a favourable means of exploring a country rich in every branch of natural history, and never before trod by the foot of an European naturalist; and he obtained permission to accompany the expedition at his own charge. On the 17th of July 1786 he sailed from Rochefort for Benin, in which and the neighbouring kingdom of Oware he spent about fifteen months, investigating its natural productions with a zeal that even the dreadful fevers of the country, with which he was attacked, were insufficient to destroy. While here he planned a journey across Africa to Abyssinia; but after having penetrated the interior for a considerable distance, he was compelled to return in consequence of his companions becoming frightened at the dangers of the route, and at the multiplying difficulties by which they found themselves opposed at every step. On his return to the coast he was attacked so severely by scurvy and yellow fever, that, to use his own words, after seeing more than five-sixths of his companions perish, and having been himself several times in the very jaws of death, it became indispensable for him to abandon the country, leaving behind him the principal part of his collection, which consisted of skins of animals, insects, dried plants, and minerals, to be forwarded to France. Fortunately, a part of these had previously been sent to M. de Jussieu, and a part was put on board the ship in which he embarked for St. Domingo, otherwise the whole fruit of so much zeal and suffering would have perished; for what he left behind him was soon after burned, along with the settlement, by an English expedition. Upon his arrival at Cape François in St. Domingo, in 1788, his health became speedily re-established. Here he formed an opinion so decidedly averse to slave emancipation, that when it was found impossible any longer to keep the blacks in subjection, M. de Beauvois was deputed by the French authorities of St. Domingo to proceed to the United States, in the hope of obtaining assistance from the American government. Upon his return from this fruitless mission, in 1793, he found the island in confusion; his collections, which had become very large, were consumed in the conflagration of Cape

François; and the negroes, now become the masters, who naturally saw nothing in him but a persecutor, threw him into prison.

While lying in prison, in daily expectation of being taken out for execution, he was enabled to escape by the faithfulness of a mulatto woman, to whom, some time before his departure for the United States, he had humanely granted her freedom. She not only effected his liberation, but procured him the means of reaching the United States. Thus was his life preserved by the devotion of one of that very race which he thought worthy of little short of eternal bondage. On his arrival at Philadelphia, penniless and friendless, he learned that his name had been inserted in the lists of proscriptions, and that it was no longer safe to return to France. But, undismayed at his apparently hopeless condition, he succeeded, by the teaching of music and languages, in supporting himself honourably, and soon attracted the notice of the few persons who at that time, in North America, occupied themselves with natural history.

Upon the arrival in the United States of the French minister Adet, De Beauvois no longer found himself straitened for means. He forthwith abandoned his occupations, and determined upon exploring the more remote parts of North America. He accordingly examined the Appalachian Mountains, and penetrated into the country of the Creek and Cherokee Indians, still collecting objects of natural history in all its branches. Among other things, he discovered the jaws and molar teeth of the great *Mastodon* on the banks of the Ohio, and he brought the tooth of a *Megalonyx* from the west of Virginia. Upon his return to Philadelphia loaded with acquisitions, he learned that his proscription had been erased, and that, by singular good fortune, his patrimony had not been sold. He immediately repaired to France, where he found his affairs in lamentable disorder, and his wife unfaithful. He divorced his wife, sold a portion of his property in order to free the remainder from incumbrances, renounced the perils of travelling, and thenceforward devoted himself to the examination and publication of his collections; but of these he found that only what he brought with him from Philadelphia and the small collections which he had forwarded while in Africa to M. de Jussieu had escaped. These however sufficed to occupy him, in conjunction with the general questions of natural history, for the remainder of his life. In 1806 he was called to the Institute as the successor of Adanson; in 1815 he was created Titular Councillor of the University of Paris by Napoleon I., upon his return from Elba; and in January 1820 he died from an attack of diarrhoea.

After his return to France, Palisot de Beauvois was the author of a considerable number of works, some of which were inserted in the transactions of learned societies, some in the 'Encyclopédie Méthodique,' and the remainder were published separately. All these, except his 'Æthéogamie,' may be supposed to have contributed more or less to the progress of science; but the works on which his reputation chiefly depend are his 'Flora d'Oware' and 'De Benin,' published in twenty parts, in folio, between 1804 and 1821; his 'Insects' of the same country, of which fifteen parts in folio appeared between 1805 and 1821; and his 'Agrostographie,' which appeared in one volume, 8vo, in 1812. The defects—and they are many—which may be found in the 'Flora' of Oware were more than compensated by the merits of the 'Agrostographie.' At the time of its publication all that related to the systematic arrangement of grasses was in great disorder. The genera of this important natural order, with the exception of what had been done by Dr. Robert Brown in his 'Prodromus Floræ Novæ Hollandiæ,' were nearly as they had been left by Linnæus, although the number of species had prodigiously increased. It was necessary to recast the whole order, in doing which new principles had to be established, and ancient prejudices to be unsparringly attacked. This was done by Palisot de Beauvois in a manner which reflected the greatest honour both upon his skill and knowledge. Objections were loudly raised against his new arrangement; but it was accepted by the public, and has become the basis of the more perfect system, which at this day seems to be everywhere recognised as the most conformable to reason and to nature.

(*Biographie Universelle; Floræ d'Oware; and Essai d'une Nouvelle Agrostographie.*)

BEAZLEY, SAMUEL, architect and playwright, was the son of a surveyor in Parliament-street, Westminster, where he was born in 1786. In early life Mr. Beazley served as a volunteer, and some of his adventures in the Peninsula and France were, as related by himself, of a somewhat romantic character. Mr. Beazley's chief claim to remembrance as an architect arises from the fact of his having erected a larger number of theatres than any other contemporary architect in England, or probably in Europe. The Lyceum (both the present one of that name, and the one on its site destroyed by fire in 1830), the St. James's and the City of London theatres in the metropolis were built by him; also two or three in the provinces, and two in Dublin. He likewise furnished the drawings for two in Belgium, one in Brazil, and one or two in India. The Strand front of the Adelphi and the colonnade of Drury-lane theatres were also erected by him, and we believe that he executed other works in connection with theatres. His theatres, though not remarkable for any high order of artistic design, have the very great merit of affording the whole of the auditory a tolerably good view of the stage, while their acoustic properties are considerably above the average. Among his other

more important works may be mentioned Studley Castle. For some years before his death he had been very extensively employed in constructing the architectural works of the South-Eastern Railway Company. The terminus at London Bridge, the stations on the North Kent line, the New Town, Ashford, Kent, the Warden Hotel, and the Pilot House, Dover, &c., are among the chief of these works. Like his theatres they are mostly well adapted to their purpose, and like them they have little other merit.

But during his life Mr. Beazley was not merely known as an architect. He was also one of the most prolific playwrights of the day, having written, it is said, upwards of a hundred dramatic pieces. They were mostly farces, and other light occasional pieces, which were forgotten by the end of the season in which they were produced: but one or two still occasionally occupy the stage. They have no literary pretensions, but, like his buildings, they appear to have exhibited great mechanical dexterity, and a keen perception of the immediate requirements of the subject. Mr. Beazley wrote two novels, the 'Oxonians' and the 'Roué'; and furnished the words to the English versions of the 'Sonnambula' and some other operas. Though apparently so constantly employed, Mr. Beazley was well known in society as a diner-out and a cheerful companion. He died suddenly at his residence, Tunbridge Castle, Kent, October 12, 1851.

(*Builder*, 1851; *Gentleman's Magazine*, 1851.)

BECCAFUMI, DOMENICO, a very celebrated painter of Siena, of the 16th century. According to Vasari he was born at Siena in 1484, and died there in 1549; others give the respective dates as 1470 and 1551. His real name was Mecherino: that of Beccafumi he derived from his patron Lorenzo Beccafumi, who placed him as a boy with Capanna, an obscure painter, to learn painting. He occupied himself chiefly in copying, and he was especially attracted by some pictures by Pietro Perugino, whose style he acquired, and never lost, notwithstanding a subsequent sojourn in Rome, and the opportunities he had of improving himself from the recent works of Michel Angelo and Raphael in the Vatican. He was in Rome during the pontificate of Julius II., but remained there only two years. He painted in distemper and in oil; better in the former style, and his small figures are superior to his larger ones. Latterly when the fame of Michel Angelo in Tuscany attained its extreme height, Beccafumi seems to have felt a necessity for invigorating his own style, and he accordingly forsook his original softness of design for a species of clumsy plumpness, and his heads became harsh and ugly. He was correct in perspective, was fond of reflections and foreshortenings, and excelled all his Siennese contemporaries in energy of composition; in other respects he was surpassed by his great rival Razzi. His best works are in Siena; he executed some at Florence, at Pisa, and some at Genoa for Prince Doria. He executed also some of the designs of the foot-pavement of the cathedral of Siena: these designs are a species of 'niello'; the outlines of the figures are cut into the stone, and filled up afterwards with a black cement. Those of Beccafumi have been engraved by Andreani and Cosati. Beccafumi cast also a few works in bronze, and is said to have executed some woodcuts, which, with the prints after his designs by other masters, are enumerated by Heineken. (Vasari, *Vite de' Pittori*, &c.; Lanzi, *Storia Pittorica*, &c.; Heineken, *Dictionnaire des Artistes*, &c.; Rumohr, *Italianische Forschungen*; Brulliot, *Dictionnaire des Monogrammes*, &c.)

BECCARIA, CESARE BONESANA, MARQUIS OF, was born at Milan in 1735. The political speculations of France having spread to Italy, co-operated with the instructions of Genovesi at Naples, and the perusal of the political works of Montesquieu, in directing Beccaria to the study of moral and political philosophy. In his twenty-seventh year Beccaria published his first work, entitled 'Del Disordine e de' remedii delle monete nello stato di Milano' ('Of the Abuses of the Coinage in the State of Milan and their Remedies'). Count Firmian, the Austrian governor of Lombardy, encouraged Beccaria, the counts Verri, Frisi, and others to form a society in Milan, for the diffusion of literature and liberal opinions; and in 1784 and 1765 the society, in imitation of the 'Spectator' of Addison, published 'Il Caffè,' a periodical, which was completed in 2 vols. 4to, and consisted chiefly of papers on men and manners, with occasional discussions of important moral and political topics. The best papers are by Beccaria—his most humorous is on 'smells,' and his most original on 'style.' The last is an attempt to prove that all men have an equal capacity for poetry, eloquence, &c., and that they only require proper training. While this work was going on, Beccaria read in 1764, to the Literary Society, the manuscripts of his work on 'Crimes and Punishments,' and in the same year, at their request, published it under the title of 'Trattato dei Delitti e Delle Pene,' ('Treatise on Crimes and Punishments'), 12mo. The work had great success. In Italy three editions were sold within six, and six editions within eighteen, months. In a few years it was translated into almost all the languages of Europe. It has been twice translated into French. It was translated in 1802 into modern Greek by Coray, for the benefit of his countrymen. An anonymous English translation appeared in 1766, with a translation of a commentary attributed to Voltaire.

The arrangement of the work is immethodical. The style is clear and occasionally eloquent. It breathes a fervid love of freedom and humanity. In thought it is deep and original—the subject was a most important and interesting one. These things all contributed to

its popularity, and Beccaria led the way, in which he has had a host of followers. His arguments have been repeated, strengthened, and enforced; and in England particularly the progress of criminal legislation has been on the whole in the track he pointed out. He advocates education as a means of preventing crime, and here too we are endeavouring to follow his precepts.

Beccaria's success in this publication was not unalloyed. Accusations of impiety and sedition were brought against him in Milan, from the effects of which nothing but the powerful friendship of Count Firmian protected him. In 1768 the Austrian government founded a professorship of political philosophy for him at Milan, which he filled with distinguished success. In 1769 he published a 'Discourse on Commerce and Public Administration,' which was translated into French by J. A. Comparet; and in 1781 a report of a plan for producing uniformity in the weights and measures of Milan. He died of apoplexy in November 1793. The lectures which he delivered as a professor were published at Milan in 1802, and they form a part of the series of 'Italian Economists,' published at Milan in 1804.

BECCARIA, GIOVANNI BAPTISTA, born at Mondovì October 3, 1716, went to Rome and commenced the study of theology in 1732, entered the congregation of clerks regular, and was afterwards professor of philosophy at Palermo and Rome till 1748, when the king of Sardinia invited him to Turin. He published in 1753 'Dell' Eletticismo Naturale ed Artificiale.' In 1758 he published 'Lettere sull' Eletticismo,' addressed to Beccari, president of the Institute of Bologna. In 1759 he was engaged to measure a degree of the meridian in Piedmont, which he began in 1760, and finished before 1774, in which year the result was published at Turin, in a work entitled 'Gradus Taurinensis.' He afterwards replied to some objections of Cassini in 'Lettere d'un Italiano ad un Parigi.' There are some papers of his in the 'Phil. Trans.,' 1766-69. He published also 'Experimenta atque Observationes,' &c., 1769; 'Dell' Eletticismo Artificiale,' 1772, of which an English translation was published, at the recommendation of Franklin; 'Dell' Elettricità Terrestre Atmosferica à Cielo Sereno,' 1755; besides various other smaller pieces, of which a catalogue is in 'Memorie Storiche Intorno à gli Studi del Padre Beccaria,' by the Abbé Landi. He left a large number of manuscripts to M. Balbe, who wrote the account of him in the 'Biographie Universelle,' from which the preceding is abridged. He died May 1781.

Beccaria is principally known by his experiments on electricity, to which he was led by Franklin's writings. He showed that the passage of electricity is not instantaneous through the best conductors; that water, in small tubes, is a very imperfect conductor, and that its power in that respect increases as the tube becomes larger: he also first showed the electric spark in its passage through water, by confining the fluid in small tubes. The Piedmontese measure of the meridian is not now considered as entitled to much confidence. It has been of late years remeasured by Plana and Carlini, and the astronomical part proved to be erroneous.

BECHSTEIN, JOHANN MATTHIAS, was born July 11, 1757, at Waltershausen, in the duchy of Saxe-Gotha. He was educated in the gymnasium at Gotha, and at the university of Jena. Though intended for the Church, he early entertained so strong a passion for ornithology and botany, and particularly for the improvement of forest management, that he determined to abandon his former profession. Having become convinced of the advantages of an institution for giving instruction as to the growth and management of timber, he proposed a plan for the establishment of one to the Duke of Saxe-Gotha in 1791, but the duke declined. Bechstein then opened one at his own risk at Kemnote, near Waltershausen, at which the instruction began in 1794, and the institution was opened for the reception of students in the following year. At the same time he organised a society for 'Forest and Hunting Science,' the useful effects of which are shown in many pages of its 'Annals;' and in a journal, 'The Diana,' that Bechstein also published. As his institution instead of receiving support from the ducal government had impediments thrown in its way, Bechstein listened to an offer of George, duke of Saxe-Meiningen, and removed to Dreissigsacker in 1800. In the service of this prince he remained till his death in 1822 as privy and forest councillor.

Among Bechstein's numerous works we may mention his 'Forest Insectology,' 3 vols., 1818; 'Forest Botany,' 1810, which has gone through several editions; 'Forest and Hunting Science in all its Branches,' 5 vols., 1818-21, which has been continued by Laurop; 'Complete Handbook of Forest Science,' 1801-09; 'Portraits of Objects of Natural History,' 8 vols., 1793-1810; and the 'Natural History of Cage-Birds,' 1840, which has gone through several editions in Germany, and has been translated and published in English.

BECKER, FERDINAND WILHELM, was born on the 24th of April 1805 at Hörter on the Weser, where his father, the distinguished philologist, Dr. Karl Ferdinand Becker, lived as a physician. The family removed from Hörter to Göttingen, and it was in the high school of that town that Becker received his first classical education, while his father led him to collect minerals and plants, and thus to lay an early foundation for his subsequent studies in natural science. In 1816 the family left Göttingen, and settled at Offenbach, near Frankfurt on the Main. Here Becker continued to devote his attention chiefly to botany, chemistry, and natural philosophy, partly under the

he had begun to apply that science—then, so to speak, new—in the production of mineral substances, and in the treatment, by the humid way, of the ores of silver, lead, and copper. Among the substances which he obtained by slow electric action are aluminum, silicium, glucium, and many others, including phosphates, carbonates, sulphureta, iodureta, &c. And to him we owe that method of electric coloration on gold, silver, and copper, which has since been adopted in the arts.

Bequerel's object in electro-chemistry has been to establish the relations existing between electrical affinities and forces, and to provoke the action of the first in virtue of the second. Gilding and plating, by the humid way, as well as electrotype, are only different applications of electro-chemistry. Among the other works of this distinguished savant, we may mention his researches on the electric conductivity of metals, on galvanometers, on the electric properties of tourmaline, on atmospheric electricity, on effects produced during vegetation, on an electro-magnetic balance for measuring with exactitude the intensity of electric currents, and on the use of sea-salt in agriculture. That these are but a few of the whole may be judged of from the fact that Bequerel has contributed more than a hundred papers to the 'Mémoires de l'Académie des Sciences,' at Paris.

Such labours were not likely to pass unrecognised. Bequerel was elected a member of the Académie in 1829, and a foreign member of the Royal Society of London in 1837. In the same year the society gave him their Copley medal, for his "various memoirs on the subject of Electricity." He was chosen into the Council-General of the Loiret in 1847, in which he has brought his scientific knowledge to bear on the questions discussed, particularly that on the improvement of Sologne; and his reports to the Académie have influenced and guided the government in their works of amelioration.

Bequerel is also one of the professors-administrators of the Museum of Natural History. Besides the papers above mentioned, numerous others are printed in the 'Annales de Physique et de Chimie.' His 'Traité de l'Électricité et du Magnétisme,' in 7 vols., appeared 1834-40; and he has published a 'Traité d'Electro-Chimie;' 'Traité de Physique considérée dans ses rapports avec la Chimie et les Sciences Naturelles,' 2 vols.; 'Des Climats, et de l'Influence des Sols boisés et déboisés;' 'Traité de Physique terrestre et de Météorologie,' &c.

In this last-mentioned work, Bequerel has been assisted by the younger of his two sons, Alexander Edmond, who, born in 1820, has greatly distinguished himself in physical science, and is now professor of physics at the Conservatoire des Arts et Métiers.

BEDA, or BEDE, an English monk, one of the brightest ornaments of the 8th century, and one of the most eminent fathers of the English church, whose talents and virtues procured him the name of the 'Venerable Bede.' There has been considerable difference of opinion among writers both as to the year and the place of Bede's birth. The year is variously given from 672 to 677; but the most probable date is 673, or, as Stevenson labours to prove, 674. His birthplace was somewhere upon the estates which afterwards belonged to the two abbeys of St. Peter and St. Paul in the bishopric of Durham, at Wearmouth and Jarrow, near the mouth of the river Tyne. Monkton by Jarrow, near the mouth of the Tyne, is the locality usually adopted; but Lingard and some others consider that Sunderland, at the mouth of the Wear, has the better claim. At seven years of age he was taken to the monastery of St. Peter at Wearmouth, and committed to the care of Abbot Benedict Biscop, under whom and his successor Ceolfrid he was carefully educated for twelve years, a favour which he afterwards repaid by writing their lives. In his nineteenth year he took deacon's orders, and in his thirtieth year, at the instance of Ceolfrid his abbot, was ordained priest, both times by John of Beverley, then bishop of Hagustald, or Hexham, who had been one of his early preceptors. The fame of Bede now reached even to Rome, and Pope Sergius, according to a letter inserted by William of Malmesbury in his 'English History,' made an earnest application to Abbot Ceolfrid that Bede might be sent to assist him in the promulgation of certain points of ecclesiastical discipline. Mr. Stevenson doubts the accuracy of this statement, and on the authority of an ancient copy of this letter among the Cotton manuscripts, in which the name of Bede does not occur, charges Malmesbury with having interpolated Bede's name. Be that as it may, Bede did not either then or at any subsequent period go to Rome, but spent the whole of his tranquil life in his monastery, improving himself in all the learning of his age, but directing his more particular attention to the compilation of an 'Ecclesiastical History of the English Nation,' the materials for which he obtained partly from chronicles, partly from annals preserved in contemporary convents, and partly from the information of prelates with whom he was acquainted. Making allowance for the introduction of legendary matter, which was the fault of the age, few works have supported their credit so long, or been so generally consulted as authentic sources. Bede published this history about the year 734, when, as he informs us, he was in his fifty-ninth year, but before this he had written many other books on various subjects, a catalogue of which he subjoined to his history. By these he obtained such reputation as to be consulted by the most eminent churchmen of his age, and particularly by Egbert, archbishop of York, who was himself a very learned man. To him Bede wrote an epistle which illustrates the state of the church at that time. It was one of the last, and indeed probably

the very last, of Bede's writings. In this letter he expresses himself with much freedom, both in the advice he gave to Egbert, and with respect to the inconveniences which he foresaw would arise from the multiplication of religious houses, to the prejudice both of church and state.

It appears from this epistle that Bede was much indisposed when he wrote it, and probably began to fall into that declining state of health from which he never recovered. William of Malmesbury, in his history ('De Gestis Regum,' lib. iii., c. iii.), and Symeon of Durham, in his account of the Church of Durham (lib. i., c. xv.), chiefly from the relation of one Cuthbert, a fellow monk, have preserved full accounts of the manner in which Bede died: whence we learn that the last stage of his distemper was an asthma, which he supported with great firmness of mind, although in much weakness and pain, for seven weeks, during which time he did not in the least abate his usual employments in the monastery, but continued to pray, to instruct the younger monks, and to prosecute the literary undertakings which were still in his hands. In the nights of his sickness, in which from the nature of his disease he had little sleep, he sung hymns and praises to God; and though he expressed the utmost confidence, and was able, on a review of his own conduct, to declare seriously that he had so lived as not to be afraid to die, yet he did not deny his apprehensions of death, and that dread which is natural to man at the approach of his dissolution. He was continually active to the last, and particularly anxious about two works; one his translation of St. John's Gospel into the Saxon language, the other some passages which he was extracting from the works of St. Isidore. From the monks' relation it appears that the day before his death he grew much worse, and his feet began to swell, yet he passed the night as usual, and continued dictating to the person who acted as his amanuensis, who, observing his weakness, said, "There remains now only one chapter, but it seems difficult to you to speak." To which he answered, "It is easy; take your pen, mend it, and write quickly." About nine o'clock he sent for some of his brethren, priests of the monastery, to divide amongst them some incense and other things of little value, which he had preserved in a chest. While he was speaking the young man, Wilberch, who wrote for him, said, "Master, there is but one sentence wanting;" upon which he bid him write quick, and soon after the scribe said, "Now it is finished." To which he replied, "Thou hast said the truth—consummatum est. Take up my head; I wish to sit opposite to the place where I have been accustomed to pray, and where now sitting I may yet invoke my Father." Being thus seated, according to his desire, upon the floor of his cell, he said, "Glory be to the Father, and to the Son, and to the Holy Ghost;" and as he pronounced the last word he expired. He died, according to the best opinion, May 26th, 735, though the exact date has been contested. His body was interred in the church of his own monastery at Jarrow, but about the middle of the 11th century it was removed to Durham, and placed in the same coffin or chest with that of St. Cuthbert, as appears by a very ancient Saxon poem on the relics preserved in the cathedral of Durham, printed at the end of Symeon of Durham's history. (Twysden's 'Decem Scriptores,' col. 32.) Early in the 12th century the bones of Bede were placed by Bishop Pudsey in a casket of gold and silver in the Galilee of the cathedral, where they remained till removed with other relics by the reformers.

Malmesbury says:—"With this man was buried almost all knowledge of history down to our times; inasmuch as there has been no Englishman either emulous of his pursuits, or a follower of his graces, who could continue the thread of his discourses now broken short."

The first catalogue of Bede's works, as we have before observed, we have from himself, at the end of his 'Ecclesiastical History,' which contains all he had written before the year 731. This we find copied by Leland, who also mentions some other pieces he had met with of Bede's, and points out likewise several that passed under Bede's name, though, in Leland's judgment, spurious. (Leland, 'De Script. Brit.,' ed. Hall, Oxford, 1709, tom. i. p. 115.) Bale, in the first edition of his work on British writers (4to, Gipsesw. 1548, fol. 50), mentions ninety-six treatises written by Bede, and in his last edition (fol. 1559, p. 94) swells these to one hundred and forty-five tracts; and declares at the close of both catalogues that there were numberless pieces besides of Bede's which he had not seen. Pits has enlarged even this catalogue: it is hardly necessary to say that the appropriation of many of them is quite arbitrary.

The 'Historia Ecclesiastica' was printed for the first time about 1474, in the type which passes for that of Conrad Fyner of Ealing; a copy of it is preserved in the Bibliothèque du Roi at Paris, and there is another copy in the library which the Right Honourable Thomas Grenville bequeathed to the British Museum. It is a volume of extreme

* "Accipe tuum calamum, tempera, et scribe velociter." The reader who may be desirous to arrive at the exact meaning of this passage (one of some interest in an antiquarian point of view, and which has been differently rendered by almost every translator), will find it amply discussed and illustrated with much curious learning in vols. x., xi., and xii. of 'Notes and Queries;' but the learned annotators appear to be quite unable to agree as to the literal meaning. The most feasible suggestion, if the above rendering be objected to, is that of Sir Emerson Tennant, that 'atramentum' is to be understood, and that consequently instead of 'mending your pen,' it should be 'moisten your ink'—the ink being kept, as it is at present where reed pens are used, either dry or as a paste.

rarity. King Alfred translated this history into Saxon, and the royal version, accompanied by the original Latin, was published first by Wheloe, fol. Camb., 1644, and subsequently by Dr. Smith, canon of Durham, with greater care, fol. Camb., 1722. An English translation of this history was first published at Antwerp in 1585, by Thomas Stapleton, a doctor of divinity of the University of Louvain; another and better translation by John Stevens was published, 8vo, Lond., 1723, immediately after the publication of Dr. Smith's edition; and others have since appeared, translated by the Rev. William Hurst, Dr. Giles, &c. The best edition of the Latin text is that published by the English Historical Society in 1838, under the care of Mr. Joseph Stevenson, who added a valuable Life of Bede and Introduction to the History.

The first general collection of Bede's works was published at Paris in 1544, in three volumes folio. They were printed again at the same place in eight volumes folio, in 1554; and subsequently at Basel and Cologne. The 'Complete Works of Venerable Bede,' edited by Dr. Giles, with a new Life by the Editor, was published in London in 12 vols. 8vo, 1842, &c. Those treatises of Bede's which are mentioned in his own catalogue of his works were published by the learned and industrious Mr. Wharton, from three manuscripts in the valuable library in the archiepiscopal palace at Lambeth, under the title of 'Bede Venerabilis Opera quaedam Theologica, nunc primum edita, necnon Historica antea semel edita. Accesserunt Egberti archiepiscopi Eboracensis Dialogus de Ecclesiastica Institutione, et Adhelmi Episcopi Sareburnensis Liber de Virginitate, ex codice antiquissimo emendatus,' 4to, Lond., 1693.

BEDDOES, THOMAS, a distinguished physician, was born at Shiffall, in Shropshire, in April 1760. His father, who was a tanner, wished to bring up his son to the same business, but his grandfather, perceiving the abilities which he early manifested, prevailed upon his father to educate him for some profession. An accident which befell his grandfather, and required the attendance of a surgeon, determined young Beddoes to study medicine. In 1776 he entered at Pembroke College, Oxford, and soon became distinguished for his learning, and his acquaintance with languages, both ancient and modern: in the latter he was entirely self-instructed. During his residence at the university he also devoted much of his time to botany, geology, and mineralogy, and especially to chemistry. He early formed high expectations of the uses of the discoveries in chemistry made by Black and Priestley as applied to the treatment of diseases, and had that direction given to his mind which ever afterwards induced him to trust greatly to pneumatic medicine. Having, in 1781, taken his Bachelor's degree, he proceeded to London to study medicine, and became a pupil of the celebrated Sheldon.

In 1784, while residing in London, he published, but without his name, a translation of Spallanzani's 'Dissertations on Natural History.' In the autumn of 1784 he removed to Edinburgh, where he spent two winters and one summer. He was greatly distinguished among the students, and attracted the notice of Dr. Cullen, by whom he was employed to add notes to his translation of Bergman's 'Essays on Elective Attractions,' to which work Beddoes affixed his name.

In 1786 he took his degree of Doctor of Medicine at Oxford; and in the course of the following summer visited France, where he became acquainted with Lavoisier and other celebrated chemists. On his return from the continent he was appointed reader in chemistry to the University of Oxford, where he maintained the current doctrines of the day with much learning, ingenuity, and eloquence. In 1790 he published 'Chemical Experiments and Opinions,' extracted from a work published in the last century, in which he endeavoured to obtain justice for the views and discoveries of Dr. Mayow in pneumatic chemistry. Beddoes having eagerly adopted the views of the partisans of the French revolution, the freedom with which he expressed his opinions gave so much offence to the superiors of the University of Oxford as to render his residence there no longer agreeable. Some of his religious opinions probably also contributed to determine him to resign his readership in chemistry, which he gave up in 1792.

Upon retiring from Oxford he went to reside with a friend in Shropshire, where he wrote a work, entitled 'History of Isaac Jenkins,' intended to check drunkenness; also several medical works, in which he embodied his peculiar views regarding the origin and treatment of several diseases. The attempts which had been made to maintain the soundness of the basis of the humoral pathology as the universal cause of diseases, served rather to show the inaccuracy of the theory than to add to the number of believers in it. The application of chemistry to the investigation of the composition of the fluids of the human body, and the different condition of these fluids which it demonstrated to exist in different states of disease, seemed to furnish new facts in its favour. Beddoes, with that zeal which marked all his actions, stepped forward as its advocate, and referred all diseases to the predominance or deficiency of some elementary principle. The remedies which he proposed for the cure of various diseases were in conformity with these views. He did not rest content

with writing in support of his views, but sought an opportunity of testing them by experiment, and ultimately fixed on Bristol for the scene of his pneumatic hospital. In 1798 a pneumatic institution was established, in effecting which object Dr. Beddoes was materially assisted by Mr. Richard Lovell Edgeworth, one of whose daughters he had married in 1794, and Mr. Gregory Watt. His publications at this time almost all refer to peculiar views respecting the possibility of curing diseases by breathing a medicated atmosphere. The results did not correspond with his expectations; but the undertaking was the means of bringing into notice the talents of Sir Humphry Davy, who was recommended to Dr. Beddoes by Mr. Gregory Watt, as a fit person to superintend the chemical laboratory connected with the institution. The first discoveries of this eminent chemist were given to the world in a publication which came from Beddoes's Institution. ('Contributions to Medical and Physical Knowledge from the West of England,' Bristol, 1799.) Many publications of Dr. Beddoes about this time referred to the political topics of the day, in which he always embraced the liberal side of the question. His principal medical publications after this date were—a 'Popular Essay on Consumption,' 1779, advocating of course the author's peculiar doctrines, but containing also many valuable remarks on the predisposing causes and means of preventing that disease; 'Hygeia, or Essays Moral and Medical,' which is a popular treatise on the 'Causes of Diseases,' and the means of avoiding them, 3 vols., 8vo, 1802. He also wrote at an earlier date a work on 'Demonstrative Evidence,' 1792. 'An Essay on Fever' was written in 1807, with many others of less note, which he continued to publish in rapid succession till December 1808, when, in consequence of an affection of the heart, he died, in the 48th year of his age. (Stock, *Life of Beddoes*, 1 vol., 4to, London, 1810.)

BEDELL, WILLIAM, Bishop of Kilmore in Ireland, one of the most exemplary prelates of the 17th century, was descended from a good family, and was born in the year 1570, at Black Notley in Essex. He was matriculated a pensioner of Emanuel College, Cambridge, March 12, 1584. He entered early into holy orders. In 1593 he was chosen Fellow of his college, and in 1599 took the degree of Bachelor in Divinity. He then removed from the university to St. Edmundsbury in Suffolk, where he had a church, to the duties of which he assiduously attended, till an opportunity offered, about 1604, for his going as chaplain to Sir Henry Wotton, the English ambassador to Venice. While in that city he became acquainted with Father Paul Sarpi, who took him into his confidence, and taught him the Italian language, of which Bedell became so perfect a master that he translated into that tongue the English 'Common Prayer Book,' which was extremely well received by many of the clergy there. In return for the favours he received from Father Paul, Mr. Bedell drew up an 'English Grammar' for his use. He continued eight years in Venice, during which time he not only studied the Hebrew language, but entered deeply into rabbinical learning, under Rabbi Leo.

On his return to England, Mr. Bedell retired immediately to his charge at St. Edmundsbury, where he continued his ministerial labours, employing himself at the same time in translating into Latin the 'Histories of the Interdict and Inquisition,' and the last two books of the 'History of the Council of Trent,' Sir Adam Newton having translated the first two. In 1615 Sir Thomas Jermyn, a Suffolk gentleman, presented him to the living of Horningsheath; but he found difficulties in obtaining institution and induction, Dr. Jegen, bishop of Norwich, requiring fees on the occasion so large, that Bedell considered the demand to partake of simony, and refused to pay anything beyond the expense of parchment, writing, and wax. In a few days the bishop sent for him, and gave him institution without the charge of fees. Here Bedell continued twelve years, and during that time published and dedicated to the Prince of Wales (afterwards Charles I.), 'The Copies of Certain Letters which have passed between Spain and England in matter of Religion, concerning the General Motives to the Roman Obedience, between Mr. James Waddesworth, a late pensioner of the Holy Inquisition in Sevil, and W. Bedell, a minister of the Gospel of Jesus Christ in Suffolk,' 8vo, London, 1624; afterwards reprinted by Bishop Burnet in 1685, at the end of Bishop Bedell's life.

Various causes appear to have delayed the reward which Bedell's merits deserved. He was a Calvinist, says Burnet, in the matter of decrees and grace, and preferences were generally at that time bestowed upon those who held opposite opinions. Bedell's fame however had reached Ireland, and in 1627 he was elected provost of Trinity College, Dublin—a charge which he refused to undertake till the king laid his positive commands upon him, which he obeyed, and on August 16th of that year was sworn provost. He held this office about two years, when he was advanced to the united sees of Kilmore and Ardagh, and consecrated on the 13th of September 1629, in the 59th year of his age. During his short residence at Trinity College he did much towards the restoration of order in the college, which on his arrival he found in a very unsettled state. He also revised and improved the college statutes, and introduced prayers in Irish, and a lecture in the chapel of the university. ('Journal of Education,' Nos. XI. and XII.) On going to his diocese, he found it, says Burnet, under so many disorders, that there was scarce a sound part remaining. The revenue was wasted by excessive dilapidations, and all sacred things had been exposed to sale in so sordid a manner that it was

grown to a proverb. He found too the oppression of the ecclesiastical courts excessive, and pluralities and non-residence shamefully prevailing. All these abuses he determined to rectify; and having recovered a sufficient portion of the lands of which his sees had been dispossessed, to enable him to subsist, he set an example for the reformation of further abuses by resigning (in 1630) the bishopric of Ardagh, which he had the satisfaction to see followed in other instances.

Upon the arrival of the lord-deputy Wentworth, in 1633, Bishop Bedell fell under his displeasure on account of a petition sent up by the county of Cavan, which the bishop had signed, and in which some complaints were made of, and some regulations proposed for the army. A reconciliation however took place, and the lord-deputy received him into favour. He then went on cheerfully in doing what he considered his duty for the benefit of the church, and was very successful. He loved the Christian power of a bishop, without affecting either political authority or pomp. Whatever he did was so visibly for the good of his flock, that he seldom failed of being well supported by his clergy, and such as opposed him did it with visible reluctance, for he had the esteem of the good men of all parties. In September 1638 he convened a synod, in which he made many excellent canons that are still extant; but offence was taken at this by some who were in power, and were at first disposed to call in question the legality of the meeting.

One of his most remarkable innovations was the removing his lay-chancellor, and taking upon himself to sit in his own courts, hearing causes, and retrieving thereby the jurisdiction which anciently belonged to a bishop. The chancellor upon this filed his bill in equity, and obtained a decree in chancery against the bishop, with 100*l.* costs. But, by this time, the chancellor saw so visibly the difference between the bishop's sitting in that seat and his own, that he never called for his costs, but appointed a surrogate, with orders to obey the bishop in everything, and so his lordship went on his own way.

Though no persecutor, Bedell laboured to convert the better sort of the popish clergy, and in this he had great success. He procured the Common-Prayer, which had been translated into Irish, and caused it to be read in the cathedral in his own presence every Sunday. The New Testament had been also translated from the Greek into Irish, by William Daniel, afterwards archbishop of Tuam, but Bedell first procured the Old Testament to be translated by one King. He caused likewise some of Chrysostom's and Leo's 'Homilies,' in commendation of the Scriptures, to be rendered both into English and Irish, that the common people might see that, in the opinion of the ancient fathers, they had not only a right to read the Scriptures as well as the clergy, but that it was their duty so to do.

When the rebellion broke out in October 1641, the bishop was so popular in his neighbourhood that he did not at first feel the violence of its effects. But the rebels subsequently seized him, his two sons, and Mr. Clogy, who had married his step-daughter, and carried them prisoners to the castle of Cloughboughter, where they put all but the bishop in irons. After some time the rebels abated of their severity, took the irons off the prisoners, and suffered them to be as much at their ease as they could be in so wretched a place. While thus confined, the bishop, his sons, and Mr. Clogy, preached and prayed continually to their small afflicted congregation, and upon Christmas-day the bishop administered the sacrament to them. The bishop and his family were at length removed to the house of one Dennis Sheridan, an Irish minister and convert to the Protestant religion. While Bishop Bedell remained there, and enjoyed some degree of health, he every Sunday read the prayers and lessons, and preached himself. The last Sunday he officiated was the 30th of January 1641-2, and the day following he was taken ill. On the 7th of February he breathed his last, in the seventy-first year of his age, his death being chiefly occasioned by his late imprisonment and the weight of sorrow which lay upon his mind. He was buried, agreeably to his own direction, in the churchyard of Kilmore close to his wife's coffin. His epitaph, as ordered by himself, was simply "Deponitum Gulielmi quondam episcopi Kilmorensis."

'The Books of the Old Testament,' translated by the care and diligence of Bishop Bedell into Irish, were first published, 4to, London, 1643, with O'Domhnuill's translation of the New Testament, 4to, London, 1681, appended: both were again printed in the Irish character, 12mo, 1690. O'Domhnuill, pronounced O'Donnell, is the Irish name of William Daniel, archbishop of Tuam, mentioned above: his translation of the New Testament was first published in Dublin in 1602. 'Some original letters of Bishop Bedell concerning the steps taken toward a reformation of religion at Venice upon occasion of the quarrel between that State and the Pope Paul V.' were printed 12mo, Dublin, 1742. They were found among Archbishop Usher's manuscripts in the library of Trinity College there.

BEDFORD, DUKE OF, Regent of France. John Plantagenet, duke of Bedford, was the third son of Henry IV. and Mary Bohun, daughter of the Earl of Hereford. He was knighted at the coronation of his father October 1399, being at the time not quite ten years old. He was created Duke of Bedford in the second year of the reign of his brother, Henry V. During the lifetime of his father he was governor of Berwick-upon-Tweed, and warden of the Scottish Marches; and during his brother's absence in France, he was governor and commander-in-chief of the forces in England.

Henry V. died after a short illness in 1422, at the early age of thirty-six years, leaving an infant successor only nine months old, with the disputed honour of king of France as part of his inheritance. On his death-bed he expressed his earnest desire that Bedford should "take up the administration of the affairs of France" during the minority of the young king,—leaving the less difficult administration of affairs at home to the conduct of his younger brother Gloucester, under the title of Protector. In love of martial glory, and in military talents, the Duke of Bedford was little, if at all, inferior to the deceased hero. No greater proof indeed of the high estimation in which he was held by his contemporaries need be given, than the circumstance that the Lords and Commons, in contravention of the late king's testament, passed an act, declaring, under certain well-defined limitations, the Duke of Bedford, "or, in his absence beyond seas," the Duke of Gloucester, to be protector and defender of the kingdom and the English church, and the king's chief counsellor, during the minority of the young king. The proceedings of the parliament on this occasion may be referred to as of great constitutional importance; furnishing, as they do, the first great constitutional precedent of the right of parliament, in contradistinction to the king, and in this instance in contravention to the king's will, to name a regent during the minority of his successor; and the equally decisive constitutional precedent of the right and power of parliament to fix the limitations of that regent's exercise of the prerogative. (See Hallam's 'Middle Ages,' vol. iii., and 'Parliamentary History,' vol. I.)

By the treaty of Troyes, which was concluded between the court of France and Henry V. on the 21st of May, 1420, the English king was declared to be regent of France and next heir to the French crown. On his death-bed Henry, anxious to secure this splendid inheritance for his infant son, earnestly impressed upon Bedford and his council the necessity of cultivating diligently the friendship of the Duke of Burgundy, and to offer to him in the first place the regency of France. This injunction Bedford obeyed to the letter. On the death of Henry, he immediately offered the regency to the Duke of Burgundy; and on his refusal, and at the apparent solicitation of the French king, he accepted the office himself. He conferred with Burgundy as to the best mode of observing the terms of the treaty of Troyes, and obtained from him the warmest assurances of good faith as to its observance. He also obtained the adhesion of the Duke of Bretagne to that treaty, and at a meeting which he brought about between that prince, the Duke of Burgundy, and himself, at Amiens, in April 1423, he prevailed upon them to affirm their professions of friendship with an oath, by which they swore to love each other as brothers, and to afford mutual aid against the attack of enemies. To make their union the more binding, Bedford married a sister of the Duke of Burgundy, and the Duke of Bretagne married another. Bedford led his young bride to Paris, which he had made the centre of his government, and vigorously applied himself to the consolidation of his infant nephew's inheritance.

Had Henry V. lived a few months longer, he would have been, in virtue of the treaty of Troyes, and the splendour and extent of his conquests, declared king of France. Charles VI., distinguished by the epithet of the 'Well Beloved,' with whom he had concluded that treaty, survived 'his dear son and heir' but a few months; and at his funeral, Bedford had his infant nephew, Henry VI., proclaimed 'Our Sovereign Lord, King of France and England.' The south of France however was still in possession of the Dauphin and his party, who summoned all the adherents of the ancient monarchy to the standard which that prince, as Charles VII., had raised at Chartres, the place of his coronation. All the country to the north of the Loire may be said to have been in the hands of the English, while every province south of that river, with the exception of Gascony, warmly espoused the cause of the heir of their native kings. The history of France accordingly for many years presents a series of battles and sieges, which ended in the expulsion of the English from all their conquests in the French territory.

In the first year of the war Charles VII. received a great defeat at Crevant. A still more signal disaster befel him next year at the battle of Verneuil (August 16, 1424), at which Bedford commanded in person, and displayed all the qualities of a great general. The French monarchy was only saved from ruin after this decisive battle by the conduct of the Duke of Gloucester, Bedford's brother, which deprived the latter of the aid of the forces of the Duke of Burgundy, to which he was mainly indebted for the victory at Verneuil. In his capacity of Regent of France, Bedford was thwarted, either by the ambition of his brother or the jealous policy of the English parliament, in every measure which tended to effect the subjugation of that country; but which, under no circumstances, could probably have been effected entirely. The administration of affairs in England turned altogether upon the intrigues and contests of two opposite parties, one headed by Cardinal Beaufort [BRAUFORT, CARDINAL], the other by the Duke of Gloucester; and as the former was the more powerful, and opposed to the destructive and impoverishing war-policy of the latter, the supplies of men and money for the prosecution of the war in France were doled out with so frugal a hand, that the offensive operations of the Duke of Bedford were confined to besieging some towns still held by the French king in the northern provinces.

The circumstances which deprived the Duke of Bedford of the aid of the Burgundian forces were these: Gloucester had married Jacqueline, heiress of Hainault, Holland, Zealand, and Friesland. She had

previously been married to the Duke of Brabant, first cousin of the Duke of Burgundy, but despising his tame spirit she eloped from him, and sought an asylum in England. Brabant however kept possession of her territorial dominions, which Gloucester claimed and sought to recover by force. For this purpose he entered Hainault with 5000 English men-at-arms, besides other forces, shortly after the decisive defeat of the French king at Verneuil. The Duke of Burgundy hastened with his troops to the aid of his kinsman, and Charles VII. was saved from ruin.

The siege of Orleans, memorable as one of the most extraordinary incidents in history, was commenced on the 12th of October, 1428. The fortunes of Charles hung upon the issue, and he was in despair. He was saved by the assistance of Joan of Arc, and the English raised the siege. [ARC, JOAN OF.] This memorable effect of superstition—of supernatural confidence on the one side and supernatural awe on the other—was followed by a succession of disasters to the English arms, which, while they deeply afflicted, tasked all the energies of the Duke of Bedford. With a force drawn from the garrison towns of Normandy he marched against Charles, who had just been crowned at Rheims, but failed in provoking him to risk a battle. Charles moved towards Paris. The Regent hastened after him, and after breaking the spell of the Maid's charm by repulsing her from the walls of Paris, compelled the French army to fall back upon the Loire. After various skirmishes, defeats, and successes, the Maid was captured when attempting a desperate sally from Compiègne on the 23rd of May, 1430. With the subsequent fate of the Maid of Orleans we have here no further concern, than to state that the Regent joined in bringing her to the stake.

In 1432 the Duchess of Bedford, sister to the Duke of Burgundy and the great cement of their friendship, died. Within four months after the Regent married Jacquette, daughter of the Earl of St. Pol, a vassal of the Duke of Burgundy. This marriage gave great offence to the Duke of Burgundy. Cardinal Beaufort laboured to reconcile the two princes, but the attempt failed. After the war had languished for upwards of two years, overtures were made on the part of Charles to Burgundy, and the result was a treaty of peace between them. This treaty was the death-blow to the English interest in France, and so affected the Regent that he died of mortification and anxiety at Rouen on the 13th of September, 1435, a fortnight before the treaty between Charles and the Duke of Burgundy was formally signed.

Like most of the immediate descendants of John of Gaunt, the Duke of Bedford was a patron of literature. He purchased and transported to London the Royal Library of Paris, which Charles V. had increased to "nine hundred volumes;" and his brother Gloucester presented 600 books to the University of Oxford, 120 of which cost 1000l.

BEDMAR, ALFONSO DE CUEVA, MARQUIS DE, was born in 1572. Having distinguished himself greatly by political sagacity, by fertility of resource, and by an acute judgment of men, he was chosen in 1607 by Philip III. of Spain, as ambassador to Venice, that embassy being considered the most difficult to fill of any. The Venetian republic had given great offence to Spain by siding with France, and by endeavouring, with the assistance of the Netherlands and Switzerland, to preserve the balance of power in Europe. After a long residence, which enabled Bedmar to understand all the weaknesses as well as the strength of Venice, he imagined that it would not be difficult with the aid of certain conspirators, and the outward assistance on which he could rely from Spain and Naples, to render himself master of the city. The armies of the republic had been exhausted by war. The fleet was in fine condition, but engaged on the coast of Istria, where was then the seat of war. He communicated his plans to the Duke d'Osuna, viceroy of Naples, and to Don Pedro of Toledo, governor of Milan, but only hinted at them in his communications to the Duke d'Uzès, the prime minister of Spain. Bedmar engaged one Renault, a Frenchman, to hire foreign mercenaries, whom he was to conceal in the town; and he was also to corrupt and buy over the troops of the republic, a task not esteemed difficult. The navy it was considered would exhibit more fidelity. The viceroy of Naples therefore undertook to provide persons who had gained celebrity as privateers, or rather pirates, but who were well known for their skill, to join the Venetian fleet for the purpose of embarrassing or defeating their attempts at defence. The conspirators were to attack and seize the arsenal, the doge's palace, the college of senators, and other important positions. The Milanese troops were to arrive at the precise time on the opposite shore of the continent. The mariners in the plot were to convey them across. A Spanish squadron entered the Adriatic to be ready to assist. Then the city was to be given up to plunder, and Venice was to be exterminated. The day for carrying the plot into execution was fixed for Ascension-day, during the bustle occasioned by the ceremony of the doge's marrying the Adriatic. Just on the eve one of the conspirators discovered the plot; all the others that could be found were seized, tried in secret, and executed. Bedmar, as ambassador, was not formally accused, but was ordered to quit Venice immediately. Some historic doubts have been thrown on this transaction, whether it was not a Venetian super-subtlety to discredit Bedmar; but by the best judges it is held as sufficiently established in its main facts. The event forms the subject of Otway's 'Venice Preserved.' On leaving Venice Bedmar retired to Flanders, where he acted as president of the council, and in 1622 he there received from

the pope a cardinal's hat. He afterwards went to Rome; obtained the bishopric of Oviedo, in Spain; and at Oviedo he died, in 1655.

In 1612, a little tract called 'Squittinio della liberta Veneta' was attributed to him, most probably erroneously. It was published anonymously, and made a considerable noise at the time. It was mainly directed against the privileges of the Venetians.

(Saint Réal, *Conjuration contre Venise*; Daru, *Histoire de Venise*.)

*BEECHEY, FREDERIC WILLIAM, is the son of Sir William Beechey, the painter, and was born in London in 1796. Having entered the navy when only ten years old, he was engaged as early as 1811 in an action off Madagascar, resulting in the capture of the French frigates 'Renommée,' 'Clorinde,' and 'Néréide.' In 1813, when the 'Dorothea' under Captain David Buchan, and the 'Trent' under Lieut. John Franklin, were dispatched in search of the north-west passage, Beechey sailed with Franklin, with the rank of lieutenant. Lieut. Beechey had already distinguished himself as an artist, and also by his attention to natural history, and it was given to his charge to collect and preserve such objects as were practicable, or make drawings of such as were not. This voyage, though unsuccessful in its main object, contributed many useful results to science and to natural history, and an account of them in a narrative of the voyage was published by him in 1843. For the ability displayed as an artist in the voyage he was rewarded by a parliamentary grant of 200l. In 1819, Lieut. Beechey took part in an expedition under the command of Sir Edward Parry (then commander), which penetrated to 113° 54' W. long. within the arctic polar circle. In 1821 he was commissioned, together with his brother, H. W. Beechey, to investigate by land the coasts of North Africa to the east of Tripoli. Of this undertaking he published a most interesting narrative, with descriptions of the ancient Syrtis, Pentapolis, and Cyrenaica, with a valuable and detailed chart of the coast, extending from Tripoli to Derna, or from 13° to 23° E. long. After his return home he was appointed to the command of the 'Blossom,' with the rank of commander, and directed to endeavour to penetrate the Polar Sea by the Pacific Ocean and Behring's Strait, while Franklin made the attempt over-land from North America. Beechey sailed in 1825, and returned in 1828; the voyage having lasted two years and a half. The extreme point reached in boats was 71° 23' of N. lat., and 156° 21' of W. long. While at Barrow Point, Franklin was at Point Turnagain, thus they were only 150 miles apart, but not being aware of each other's position, neither advanced. In 1827 Beechey received the rank of post captain, and during the summer of this year succeeded in discovering to the south-east of Cape Prince of Wales, and near to Behring's Strait, two most convenient harbours, to which he gave the names of Port Clarence and Port Grantley. After this voyage Captain Beechey remained unemployed for some time, as his health had suffered; but he occupied himself in preparing and publishing accounts of the various voyages in which he had been engaged. In 1828, the year of his return, appeared 'Proceedings of the Expedition to explore the Northern Coast of Africa, from Tripoli eastward, in 1821 and 1822;' the 'Voyage to the North Pole' followed; in 1831 appeared the 'Narrative of a Voyage to the Pacific and Behring's Strait;' succeeded by the Botany and Zoology of the same voyage, in two expensive quarto volumes. He had also been employed, between 1829 and 1839 in surveying the coasts of South America and Ireland. In 1854 he was created Rear-Admiral of the Blue.

BEECHEY, SIR WILLIAM, R.A., a celebrated English portrait-painter, was born at Burford in Oxfordshire, in December 1753. He was originally articled to a conveyancer, but having a strong love for painting, he determined to pursue it as a profession, and he obtained admission into the Royal Academy as a student in 1772.

Though with many able rivals, some of whom were the most eminent painters of the English school, Mr. Beechey early distinguished himself, and was elected an Associate of the Royal Academy in 1793. In the same year he was appointed portrait-painter to the Queen, of whom he painted a whole-length. In 1798 he executed his principal work, a large equestrian picture of George III., the Prince of Wales, and the Duke of York, attended by Generals Dundas, Sir W. Fawcett, and Goldsworthy, reviewing the Third and Tenth Dragoons; for which he was elected a Royal Academician and knighted by the king. This picture is now at Hampton Court.

From this time Sir William painted the majority of all the persons of distinction, rank, and fashion of his time, including several portraits of nearly all the members of the royal family. Among his portraits are also those of Lord Nelson, Lord St. Vincent, Sir W. Hamilton, Lord Cornwallis, Mr. Addington, afterwards Lord Sidmouth, John Kemble, &c. He will not take permanent rank with the great portrait-painters, but his portraits generally gave satisfaction, especially in their attitudes and expression. His colouring was gay and light, and his earlier pictures were well-modelled; but his latest works are negligently executed. There is a portrait of Nollekens by Sir William Beechey in the National Gallery. He died at Hampstead in the month of January 1859, at the age of 86. He was twice married, and left a numerous family.

(*Art-Union Journal*, February 1859.)

BEER, MEYER. [MEYERBEER.]

BEETHOVEN, LUDWIG VON, was born on the 17th of December 1770 at Bonn. His father and grandfather were both musicians by profession; the former occupied the situation of principal vocal tenor;

and the latter that of first bass singer, and subsequently 'Kapellmeister,' in the chapel of the elector of Cologne. From the earliest age Beethoven evinced a disposition for music; and as modulated sounds seldom fail to make a deep impression on a young fervid mind, when as in his case they are almost constantly presented to it, he soon acquired, and as speedily manifested, a taste for the art of which they are the foundation. His father began to instruct him when he was only in his fifth year, but soon transferred him to M. Von der Eden, esteemed the best pianist in Bonn; but he dying shortly after, Beethoven became the pupil of M. Neefe, his successor, the Archduke Maximilian of Austria defraying the expense of his tuition. This excellent master initiated his pupil in the works of Sebastian Bach. At the age of thirteen he published at Manheim and at Spire, in his own name, 'Variations on a March, Sonatas, and Songs.' But at this time his genius displayed itself more decidedly in musical improvisation. His extempore fantasias are mentioned by Gerber in his Lexicon ('Tonkünstler-Lexicon'), as having excited the admiration of the most accomplished musicians of the time.

The elector of Cologne now sent his protégé, in the character of court organist (in which office he had succeeded Neefe), to Vienna, to study under Joseph Haydn; but the great composer, being then on the point of setting out for England, placed his intended pupil in the hands of the eminent theorist, Albrechtsberger, who first gave him methodical instructions in counterpoint. After having completed his time with that master, he returned to Bonn. His patron died, and war raged in its worst form in the north of Germany; Beethoven therefore left for ever the place of his birth, and settled in Vienna, which city and the adjoining country he never afterwards quitted.

About this time (1791?) says the Chevalier von Seyfried, Beethoven most successfully tried his strength in the quartet style, "a noble style, reformed, or, more properly speaking, created by Haydn, enriched by the universal genius of Mozart with greater depth and gravity, though not at the expense of grace, and carried by Beethoven to a degree of superior power which few will attempt to attain, and perhaps none will ever surpass." He next composed the opera of 'Leonore,' better known in England under the name of 'Fidelio,' the libretto for which was taken from a French piece called 'L'Amour Conjugal.' The opera did not excite much attention at first. The next year the managers of the Karthnerthor Theatre gave 'Fidelio' for their benefit. The work then took the form which it now bears; it was reduced to two acts, and preceded by an imposing overture in E major. The composer also added the short march, the air of the jailer, and the finale of the first act.

In 1809 Beethoven determined to accept the place of Kapellmeister to the King of Westphalia, Jerome Bonaparte, which was offered to him with many advantageous conditions. The war and other circumstances prevented these conditions being completely fulfilled; and as he desired to visit England, and had been invited by the Philharmonic Society of London, who proposed to him liberal terms, he made preparations for the journey; but when the moment for departure came, he declined the proposal, as he had by this time been attacked by the malady which never left him—deafness. This calamity came on gradually, but from the first defied all remedies and every effort of skill, till at length the sense became so wholly extinct that he could only communicate with others by writing. The consequences of so severe a deprivation were, as his friend Seyfried feelingly but candidly remarks, "a habit of gloomy, anxious distrust, and a violent desire of solitude, the usual precursors of hypochondria. To read, to stroll into the country, were his most agreeable occupations; and a small, very select circle of dear friends, formed his only social enjoyment."

By slow degrees, maladies, arising probably from a long-continued state of mental irritation, attacked a frame which nature had made healthy and robust, and rendered recourse to medical aid absolutely necessary. But the hope of any cure soon vanished: symptoms of dropsy appeared, and became more and more decisive in character. He underwent the operation of tapping, which mitigated the pain he endured. During the process he very characteristically exclaimed, "Better water from my body than from my pen." During the latter part of his illness he was in a state of constant delirium; and in the evening of the 26th of March 1827 he breathed his last.

Beethoven died unmarried; and he was never known to form any attachment of a tender kind. His portraits are faithful representations. He was of the middle size, stout, and his form altogether indicated strength. Notwithstanding the strange kind of life he led, his only illness was that of which he died. His extreme reserve towards strangers prevented his displaying those excellent qualities which, under a forbidding exterior, he was known to possess; and such were the contrasts in his character, that occasionally his bluntness of remark, and his total want of reserve in offering his opinion of others, made him appear to be quite forgetful of the prescribed rules of society. Though his early education was rather neglected, yet he made up for the deficiency by subsequent application; and those who knew him well state, that his knowledge of German literature was very respectable, and that he was a tolerable proficient in Italian, though of French he knew very little. Whenever he could be induced to throw off the reserve arising, most likely, from his infirmity, his conversation became "extremely animated, full of interesting anecdote, and replete with original remarks on men and manners."

But after his decease it was found that he was conscious of his own weaknesses, and in his will had apologised for them. This curious document, so interesting to the admirers of Beethoven, to the lovers of art, and to the moral philosopher, as developing the feelings of an illustrious composer, and throwing a light on his personal character, is dated Heiligenstadt, October 6, 1802, and addressed to his brother Carl, and his nephew Ludwig Beethoven.

Beethoven's published works reach opera 120 at least; they embrace every class and are in all styles. His vocal music is full of beautiful new melody, and equally distinguished by strong feeling and a just expression of the words. His oratorio 'The Mount of Olives,' his opera 'Fidelio,' and his two masses, bear testimony to this; though, in our opinion, his numerous songs, and his two cantatas, 'Adelaide' and 'Ah! perfido, spergiuero,' with which all real lovers of music are acquainted, display taste of a more refined kind than any of his other vocal works can boast. Most of his pianoforte music is admirable, and possesses every quality that vast genius could endow it with. His quintets and quartets, or what may be termed his chamber music, are elaborately written, but so original, that they require repeated hearings before their beauties, which are of the rarest kind, are unfolded; but then the appetite for them increases in proportion as they are better known. But the grandeur of Beethoven's conceptions, and his marvellous skill in development, are most manifest in his orchestral works, in his overtures, and more especially in his symphonies. This is the field in which all his faculties are called into action; in which the wonders of his imagination are displayed, and every resource of his art is made contributory. And the power which he here exhibits is the more remarkable, as the ground seemed to be so entirely occupied by Haydn and Mozart, that no room appeared to be left for a third.

Five years after the death of Beethoven, his friend the Chevalier Ignaz von Seyfried published in German his posthumous didactic work, under the title of 'Beethoven's Studies in Thorough-Bass, Counterpoint, and the Theory of Composition, collected from his autograph MSS,' &c. M. Seyfried has added to the work a biographical sketch of the author, and that extraordinary will to which we have above alluded.

In 1845 a statue was erected to his memory in his native town of Bonn, amidst great rejoicings, and in the presence of the Queen of England. It is a fine work of art by Hülmel of Dresden.

BEGARELLI, ANTONIO, a celebrated modeller of Modena, where he was born about 1498. Who his master was is not known, but he was probably Guido Mazzoni, or Giovanni Abati, the father of Niccolo. He was the friend of Correggio, and is said not only to have instructed that celebrated painter in modelling, but to have even modelled many figures for him to facilitate his labour in the painting of the cupola of Parma, of which the numerous and strong foreshortenings rendered models necessary. There are few of the works of Begarelli left; the principal is the Descent from the Cross in the church of Santa Margherita, containing many figures in the round rather larger than life. He died in 1565. (Vedriani. *Vite di Pittori, &c., Modenesi*; Tiraboschi. *Vite, &c., Modenesi*; Fiorillo, *Geschichte der Malerey, &c.*; Lansi, *Storia Pittorica, &c.*)

BEHAM, HANS SEBALD, a very celebrated German painter and engraver of the 16th century, whose name has been corrupted into all shapes by many foreign and some German writers. He was born at Nürnberg in 1500, and was one of the best of Albert Dürer's scholars, and was a man of great ability but of profligate character. At Nürnberg he published some obscene prints, and being obliged to leave the place he settled in Frankfurt, but not to reform, for he here set up a wine-shop and brothel, and is reported to have been drowned by the authorities about 1550, on account of his extreme depravity. This is the account of Hüsgen, who refers to Lersner's 'Chronik.' Doppelmayr says he went to Frankfurt in 1540, and died there in 1550. As a painter he is scarcely known. His name is written Boehm and Beham by good authorities, and some maintain that his name was Sebald only; but most of his prints, or those attributed to him, are marked with a monogram of H. S. P. and H. S. B. in upright capitals intermingled.

His prints consist of woodcuts, and of etchings and engravings on copper. Those marked with the P. were, according to Sandrart, his earlier works; and those with the B. from about the time that he went to Frankfurt. His first instructor was his cousin Bartholomew Beham, likewise a pupil of Albert Dürer, and also of Marcantonio in Italy. Heineken enumerates 392 prints by Beham, including 58 woodcuts, and 21 done after his designs by other engravers. Bartsch describes even 430, of which 171 are woodcuts. He is reckoned among the so-called little masters, from the extreme smallness of their prints. His prints are much in the style of those of Aldegrever [ALDEGREVER, HEINRICH]; occasionally correct in drawing, but generally, especially in the draperies, in the gothic taste. His engravings are superior to his cuts and etchings.

BEHAM, BARTHEL, or BARTHOLOMAUS, cousin of Hans Sebald Beham, was born about 1496. He was a pupil of Albert Dürer, and was sent by the Duke Wilhelm of Bavaria to study in Italy. His death took place probably about 1540. Barthel Beham was extremely laborious and careful in his paintings; but if it be true that he studied in Rome in the later years of Raphael's time, he

derived little advantage from the example of the great men in the midst of whom he resided. Yet his picture in the Pinakothek at Munich, of the resuscitation of a woman by touching her with the cross, is one of the masterpieces of the old German school. The act takes place in the presence of the empress Helena and a crowd of spectators; and the picture has the following inscription:—'Crux Christi ab Helena reperitur, a Macario, mortua suscitata, adprobatur. Anno CXXLIII.' Barthel was also an engraver, and, according to Sandrart, assisted Marcantonio in his prints after Raphael. His prints are better drawn than Hans Sebald's, but they are not nearly so numerous: they probably do not exceed seventy. Many are from Greek and Roman history and mythology. Sandrart says that some of the prints which bear the name of Marcantonio were executed entirely by Behem. (Sandrart, *Teutsche Academie*, &c.; Doppelmayer, *Historische Nachricht von den Nürnbergischen Künstlern*, &c.; Hüsgen, *Artistsches Magazin*, 1790; Heineken, *Dictionnaire des Artistes*, &c.; Bartsch, *Peintre-Graveur*; Brulliot, *Dictionnaire des Monogrammes*, &c.)

BEHEM, MARTIN, a celebrated navigator and geographer, was born in the city of Nürnberg about the year 1430. His education was carefully attended to, and he is said to have enjoyed the advantage of being instructed by the learned John Müller, better known under the Latin name of Regiomontanus. In early life he followed the profession of a merchant, continuing however to cultivate the mathematical and particularly the nautical sciences, which may have become more interesting to him from the circumstance of his having to make several commercial voyages. Being on business at Antwerp in the year 1479, Behem became acquainted with some Flemings who were closely connected with the court of Lisbon, and who had formed colonies in the newly-discovered islands of the Azores. At their pressing invitation Martin went to Portugal, where, as a skilful cosmographer and maker of maps, he was well received. He was soon engaged in voyages undertaken with a view to making maritime discoveries. The many controversies and contradictions concerning Behem's life begin at this point, but the earlier of them are easily settled. Cellarius and several other writers say that Behem was the discoverer of the whole group of the Azores, but there is ample evidence to show that at least some of the Azores were seen by Vanderberg, a navigator of Bruges, in 1431, when Martin could be little more than a year old; that Gonsavo Velho Cabral visited and named the island of Santa Maria in 1432; and that all the islands were known in 1460, or nineteen years before Behem went to Lisbon, and connected himself as a geographer and explorer with the Portuguese government. Mr. Otto and other authors, again, merely make Behem the discoverer of the island of Fayal; but there is good ground for believing that the only two of the islands unknown even so early as 1449 (when King Alphonso of Portugal granted a licence to his own uncle, Don Henry, to colonise the Azores), were the comparatively small and distant islands of Corvo and Flores; and its magnitude and position must of necessity have made Fayal, with the group to which it belongs, known soon after the discovery (in 1432) of St. Mary's and St. Michael's.

In 1484 Behem was placed as a scientific man on board the fleet of the celebrated navigator Diogo Cam, who was commissioned to prosecute Portuguese discovery along the west African coasts, which were then only known as far as Cape St. Catherine in 2° 30' S. lat. With that distinguished admiral the cosmographer went to Fayal and Pico, and this we believe to be the first time he ever visited the Azores. Thence, after doubling Cape Verde, they examined all the African coast from the river Gambia to the river Zaire, or Congo, the mouth of which lies in 6° S. lat. Continuing their course, they made Cape St. Augustine, and finally reached Cape Cross, or De Padrono, in 22° S. lat., which was the limit of their voyage, and no less than 19° 30' farther south than any preceding discoverer had ventured. After an absence of nineteen months Behem returned to Lisbon, where, in reward for his services, the king (John II.) conferred the honour of knighthood upon him in a public and unusually splendid manner.

Behem married at Fayal in 1486 the daughter of Job Huertar, by whom he had a son. He settled in this island, and took great pains in colonising and cultivating it. He also busied himself in making charts, and occasionally went from the Azores to Lisbon and to Madeira. In 1492, the year in which Columbus started on the expedition that ended in the discovery of the New World, Martin Behem paid a visit to his native city of Nürnberg, where, in the course of a year's residence, and at the earnest request of his countrymen, he made a terrestrial globe, some traits and guesses in which have, perhaps more than anything else, contributed to an obstinately-maintained theory. When he returned from Germany to Portugal he was employed for a short time in some diplomatic negotiations; but in 1494, retiring from all public business, Martin repaired to his estates in Fayal, where he lived tranquilly in the bosom of his family, continuing however to keep his attention awake to his old and favourite subject, and to the progress of discovery, which after Columbus's first voyage was carried on more rapidly than ever. In 1506 he was once more at Lisbon, and on the 29th day of July in the same year, full of years and honours, he died in that city, leaving no works of any kind behind him except the maps and charts he had made, and his globe.

It is admitted on all sides that Martin Behem ought to be regarded as one of the most learned geographers, and as the very best chart-maker of his age. But these, his real and great merits, have not

satisfied certain writers, who, moved by the prejudices of country or a love of contradiction and paradox, insist that Behem, and not Columbus, was the discoverer of America. Cellarius and Riccioli both say that he visited the American continent and the Strait of Magalhaens, but Stuvenius appears to have been the first to give great importance to this doctrine; asserting in his treatise, 'De vero novi Orbis Inventore,' that Behem had accurately traced on his globe preserved at Nürnberg the islands of America, and even the Strait of Magalhaens. Professor Tozen combated this assertion as far back as 1761, and for a quarter of a century the theory was laid aside as untenable. Dr. Robertson, in his 'History of America,' took some pains to rescue the fame of Columbus, but the task was then considered almost unnecessary. In 1786 however Mr. Otto, a diplomatic servant of the French government, but a German by birth, again renewed the nearly-forgotten dispute; and in a long letter to Dr. Franklin stated his reasons for believing that Martin Behem had visited America before Columbus, and that all Columbus had done after him had been in pursuance of Behem's instructions and advice.

Mr. Otto does not seem to be aware that such an opinion was ever started before. His letter was published in the second volume of the 'Transactions of the American Philosophical Society, held at Philadelphia for promoting Useful Knowledge.' After its appearance a variety of writers and compilers of cyclopedias and biographical dictionaries, without looking into the matter, took up Mr. Otto's story as something new and striking, not knowing that it was old and had been disproved. In support of his views, Mr. Otto quotes records or documents preserved in the archives of Nürnberg; but these documents, with the exception of one letter said to be written by Behem, are undated; and some of them contradict each other, and are refuted by well-known historical facts. A great deal of pains has been expended in the support, and much more in the refutation, of Mr. Otto's theory; but it may be regarded as now a settled point that Behem has no title whatever to the great discovery claimed for him. We do not think it worth while therefore to go further into the subject.

Behem's famous globe, though a remarkable performance, was of necessity in those times both defective and erroneous even in relation to the old world. It was made up from the authorities of Ptolemy, Pliny, and Strabo, and still more from the travels of Marco Polo and the semi-fabulous travels of Sir John Mandeville. From this globe it appears that his geographical information in the east did not extend beyond Japan, nor in the west beyond the Cape Verde Islands; and that all that he had dotted down on his globe beyond those islands was from mere conjecture. Of two islands which he set down between the Cape Verde group and America, neither exists in the place assigned to it. One was called St. Brandon, the other Antilia; and from the similarity of the latter name it has been supposed to be one of the Antilles or American islands discovered by Columbus. But Columbus only gave the name of a fabulous island to a real one; for, long before his time, the denomination of Antilia or Antilla had been assigned to a supposed country somewhere westward of the Azores. Andrea Bianco, a Venetian geographer who lived at the beginning of the 15th century, indulged precisely in the same speculation. Among a collection of his charts bearing the date of 1436 (that is, fifty-six years before Martin Behem made his globe), there is one in which he lays down a very large island at a great distance to the west of the Azores, and which he calls Antilia, and marks the beginning of another island which he calls La Man di Satanasso, or 'the Devil's Hand.'

BEHN, APHARA, sometimes spelt APHRA, and AFRA, a dramatist and miscellaneous writer, was of a good family in the city of Canterbury: she was born in the reign of Charles I., but in what year has not been ascertained. Her father, whose name was Johnson, was related to the Lords Willoughby, and by means of his connection obtained the post of lieutenant-general of Surinam, and its dependencies; for which place he accordingly sailed with his daughter (then very young), but died on the passage. Aphara however continued the voyage; and appears to have resided at Surinam for some length of time, though under what circumstances is not known. She there became acquainted with the famous slave Oroonoko, whom she represents to have been a prince among his own countrymen, and a man of an heroic cast of character, and who afterwards became the subject of a novel from her pen, and of a tragedy, better known, by her friend Southern. After her return to England she married Mr. Behn, a merchant of Dutch extraction; and appears to have been personally introduced to Charles II., who was so much pleased with her account of Surinam, and probably with the freedom and vivacity of her manners, that he is said to have thought her a proper person to be intrusted with the management of some affairs during the Dutch war, which occasioned her going into Flanders, and residing at Antwerp. It is supposed that by this time her husband was dead. Mrs. Behn succeeded in discovering the intention of the Dutch to sail up the Thames and Medway; but the court of Charles, with its usual levity, giving no credit to the report of its fair envoy, she is said to have renounced all further politics, out of mortification, and to have devoted the rest of her stay in Holland to amusement. She set out shortly afterwards on her return to England, narrowly escaped death (for the vessel foundered in sight of land, and the passengers were saved in boats), and became for the rest of her life an authoress by profession, and a woman of gallantry. She wrote seventeen plays, besides poems,

tales, love-letters, and translations both in prose and verse. The once celebrated letters between a nobleman and his sister-in-law (Lady Henrietta Berkeley and the infamous Lord Grey) are hers. She contributed the paraphrase of *Ænone's 'Letters to Paris,'* in the English collection of Ovid's *'Epistles,'* and translated Fontenelle's *'Plurality of Worlds,'* and the sixth book of Cowley's Latin poem on *'Plants.'* Both her opinions and her talents naturally brought her acquainted with the leading wits of the day, the wildest and the staidest, Rochester, Etherege, Charles Cotton, Dryden, Southern, &c. At one time she describes herself as having been forced to write for her bread; but during the latter part of her life she appears to have been in more easy circumstances. She died between forty and fifty years of age, and was buried in the cloisters of Westminster Abbey.

Aphara Behn is described as having been a graceful comely woman, with brown hair, and a piercing eye; something passionate, but generous; and who would sooner forgive an injury than do one. She would write in company, and at the same time take her part in the conversation. The character of Mrs. Behn's writings is that of a lively mediocrity, availing itself of all the licence of the age. She wrote some coarse but pleasing little novels, chiefly taken from the French; some clever songs and poetical translations; and a set of dramas, successful in their day, and astounding for their licentiousness.

BEHRING, VITUS, was by birth a Dane, and in his youth made many voyages to the East and West Indies; but being tempted by the great encouragement held out to able mariners by Peter the Great, he early entered the navy of Russia, and served in the Cronstadt fleet in the wars with the Swedes. He obtained the rank of lieutenant in 1707, and of captain-lieutenant in 1710. In 1732, previous to setting out on his last expedition, he was promoted to the rank of captain-commander.

The Empress Catherine being anxious to promote discovery in the north-east quarter of Asia, and to settle the then doubtful question as to the junction of Asia and America, Behring was appointed to command an expedition for that purpose. He left St. Petersburg in February 1741, and after exploring several rivers, travelled over-land by the way of Yakutsk, on the Lena, to Okhotsk, then crossed over to Bolcheretak, and arrived at Nishnei-Kamtschatka-Ostrog. Here he built a small boat, and sailed on the 20th of July 1741, coasting Kamtschatka till he reached in August (67° 18' N. lat. by his observations) a cape which, from the land beyond it trending so much to the westward, he supposed to be the north-easternmost point of Asia. In this conjecture however, as has since been proved, Behring was mistaken; the point reached by him must have been Serdze Kamen; but with this conviction on his own mind, and the approach of winter, he determined to retrace his steps, and he returned in safety to Nishnei Kamtschatka. It is pretty certain that he did not reach the strait which has since received his name. The following year he made another attempt in an opposite direction, and reached Okhotsk, having doubled the southern promontory of Kamtschatka, which peninsula was up to that time generally believed to join Japan. From Okhotsk he went to St. Petersburg, and, having obtained his promotion, in 1743 took the command of an expedition for the purposes of discovery, which was fitted out on a very large scale. After several exploratory excursions, he stationed himself at Yakutsk, directing various detachments of his officers down the rivers on different points of the Frozen Ocean. In 1740 he reached Okhotsk, where vessels had previously been built for him, in which he sailed for Awatska Bay, where he founded the settlement of Petropaulovski, and passed the winter. His discoveries to the northward being deemed sufficiently satisfactory, he was now directed to proceed to the eastward towards the American continent. He left Awatska in June 1741, steering to the south-east; but having reached the parallel of 46° without seeing land, he altered his course to the north-east, and on the 18th of July (having been forty-four days at sea) he descried very high mountains covered with snow in 58° N. lat., having made, according to his reckoning, 50 degrees of E. long. from Awatska. He now followed the coast to the northward, which was found to take a very westerly direction; but his crew suffering from sickness, and the ship being in a very disabled state from bad weather, he resolved to return to Kamtschatka, which however he never reached. Having passed several islands, his ship was wrecked on the island which now bears his name, on the 3rd of November 1741. Behring died from cold and exhaustion on the 8th of the following month.

In the following summer the survivors of his crew reached Kamtschatka in a small vessel which they built from the wreck, and thus some account of this disastrous voyage was preserved. With regard to the places that he touched at on the American shore, they must be very undefined; but the fact of the westerly trending of the coast, and the high mountains, seem to place his first landfall about Admiralty Bay, on that part of the coast now called New Norfolk. The islands mentioned by him must have been some of the Aleutian Archipelago.

(Müller, *Account of Russian Discoveries.*)

*BEKKER, IMMANUEL, was born at Berlin in 1785. He first studied at the Gray Convent in that city, under the late G. L. Spalding. Thence he removed to the University of Halle, in 1803, where he became the most distinguished scholar of the celebrated F. A. Wolf, who at a subsequent period, as the person best fitted to continue his

philological labours, named Bekker. In 1807 he was appointed professor of philology in the University of Berlin; and in May 1810 travelled to Paris to avail himself of the treasures in the Imperial Library there, and more especially to compare and collate the manuscripts of Plato, as also those of some Greek orators and grammarians. He returned to Berlin with his acquisitions in 1812. In 1815 he was elected a member of the Academy of Sciences at Berlin, and in the same year was requested by that body to repair again to Paris, in order to avail himself of the papers of Fourmont, for a projected *'Corpus Inscriptionum Græcorum,'* a task which he completed within the same year. In 1817 the Academy again commissioned him to journey to Italy, in order to unite with Göschen in deciphering the palimpsest manuscript of the Institutes of Gaius, which had been discovered at Verona by Niebuhr. He was also to collect materials for an edition of Aristotle, which he had undertaken. In pursuance of these objects, he passed two winters in Rome, where, through the introduction of Niebuhr, he was readily admitted to all the best libraries. He visited also, for similar investigations, Florence, Venice, Naples, Montecassino, Cesena, Ravenna, and Milan. In 1819 he travelled through Turin to Paris. The summer of 1820 he spent in England, chiefly in London, Oxford, and Cambridge, returning in the autumn by Leyden and Heidelberg to Berlin. His labours as an author during this period were neither few nor unimportant; and those which have succeeded them since he settled at Berlin have been equally interesting to the classical student and the philologist. His first publication—the *'Anecdota Græca,'* in 3 vols., of which the first appeared in 1814, the last not till 1821—was a favourable specimen of his industry and knowledge. Then followed editions of Plato, in 10 vols., 1816-23; of Thucydides; of the Attic orators, containing Demosthenes and other Athenian orators, in 7 vols., first published at Oxford in 1822; of Photius; of the Scholias of Homer's *'Iliad,'* 2 vols., 1825; of Aristotle, 4 vols., 1831-36; of Tacitus, 2 vols., 1831; and of Sextus Empiricus, 1842. To these must be added an active co-operation in the production of the *'Scriptores Historias Byzantinas,'* for which he prepared, among others, Cedrenus, Ducas, Glykas, Korpis, Merobaudes, &c., &c. He has also written for the Journal of the *'Akademie der Wissenschaften of Berlin,'* essays upon the Romance language, upon the romance of Aspremont, and upon Provençal poetry. (*Conversations Lexikon.*)

BELIDOR, BERNARD FOREST DE, was born in Catalonia in 1697 or 1698. He was the son of a French officer, and his father and mother dying very shortly after his birth, he was adopted by another officer, who brought him to France. Under the care of his protector's brother, who was an officer of engineers, Belidor, who had studied the elements of mathematics with attention, saw the sieges of Bouchain and Queanoy before he was sixteen years old. Shortly afterwards he was employed to assist Cassini and Lahire in their continuation of the measure of the degree. Subsequently he was appointed professor at the school of artillery of La Fère. Having lost this office he became in 1742 aide-de-camp to General Segur in Bohemia and Bavaria, and was made prisoner at Linz. By close study he became an eminent engineer, and was much employed in Germany, Italy, and Flanders. He was elected a member of the French academy in 1756; was made inspector of arsenals in 1758, and brigadier and inspector-general of mines in 1759. He died at Paris in 1761.

The works of M. Belidor have even now some authority among military engineers, and he advanced every branch of their science, particularly mining. The works of Belidor are as follows: 1725, *'Nouveau Cours de Mathématique;'* 1729, *'La Science des Ingénieurs;'* 1731, *'Bombardier Français;'* 1737 and 1739, the first two volumes of the *'Architecture Hydraulique'* (the last two volumes appeared in 1750 and 1753); 1755, *'Dictionnaire Portatif de l'Ingénieur;'* 1764 (erroneously dated on its own title 1754), posthumous work, *'Œuvres Diverses,'* &c., relating to fortification and mining. There are memoirs by M. Belidor in the *'History of the Academy of Sciences,'* from 1737 to 1756.

BELISARIUS, a general of the lower empire, under Justinian I, was born at Germania in Illyria about A.D. 505: of his parentage nothing is known. He makes his first appearance in history as one of the body-guard of Justinian, at that time heir to the throne. The Byzantine empire was then, about 525, at war with Persia, and Belisarius exercised his first command in an expedition into Persarmenia. On his return he was nominated to the government of Dara, an important fortified town in the northern part of Mesopotamia, near the frontier of Armenia, where he took into his service, as secretary, the historian Procopius, whose writings are our principal authority for the events of his life. In 527 Justinian came to the throne, and by his orders Belisarius proceeded to build a fortress at Mindon, near Dara. The Persians commanded him to desist, and on his refusal marched against him, defeated his troops, and razed the works. We may conclude however, that no blame attached to him, as shortly after we find him appointed general of the East, with the conduct of the Persian war. In the year 530 he defeated the enemy in the decisive battle of Dara; and in the following year he repulsed, by a series of skilful manoeuvres, a considerable army, which had invaded Syria on the side of the desert, and advanced so far as to threaten Antioch. Being however compelled by his troops to give battle, contrary to his own inclination, at Callinicum, a town at the junction of the rivers

Bilecha and Euphrates, he sustained a defeat, but succeeded in preventing the Persians from deriving any advantage from their victory.

Shortly afterwards peace was concluded, and Belisarius returned to Constantinople. During his residence there he married Antonina, an actress by profession, and a woman of the most dissolute character. By his energy he succeeded in suppressing a sedition which had nearly subverted the throne of Justinian. In June 533 he sailed as commander of an expedition for the recovery of those provinces of Africa which had anciently belonged to the empire, but were now possessed by the Vandals. He landed in September at Caput Vada, now Capoudia, about 150 miles south of Carthage, and advanced without opposition to Decimum, about eight miles (seventy stadia) from Carthage. Having defeated the enemy at Decimum, he immediately entered the capital, while Gelimer, the Vandal king, fled towards the deserts of Numidia, where he occupied himself in assembling an army at Bulla, four days' journey from Carthage. Belisarius suppressed a conspiracy which Gelimer had tried to organise among the Carthaginians and Huns in the Byzantine service, and he afterwards defeated the Vandal army which had advanced to Tricameron, within twenty miles of Carthage. Gelimer fled to the inaccessible mountain of Pappus, near Hippo Regius, where he was blockaded, and some time afterwards obliged to surrender. On his return to Carthage, Belisarius sent detachments which reduced Sardinia and Corsica, and the Balearic Isles; he likewise recovered the fortress of Lilybæum, in Sicily, which the Vandals had received as the dowry of a Gothic princess, and which, on their downfall, had been resumed by the Goths. He proceeded for some time in the settlement of the province, but finding that suspicions of his fidelity had been excited in the mind of Justinian, he determined to disarm them by a speedy return. He committed the government to the eunuch Solomon, and set sail for Constantinople. On his arrival he was honoured with a triumph, an honour which, since the reign of Tiberius, had been reserved for the emperors alone; a medal was struck, with the inscription "Belisarius, the glory of the Romans," and in the ensuing year (535) he was invested with the dignity of sole consul.

In that year he sailed with a very insufficient force for the conquest of Italy from the Goths: he landed at Catania in Sicily, and having rapidly reduced that island, fixed his head-quarters at Syracuse. While at Syracuse he received news of a rebellion in Africa. He immediately set out thither with only one ship and a hundred guards, and had nearly succeeded in restoring subordination, when he was recalled to Sicily by a mutiny in the army there. Some negotiations which had been in progress between the Goths and Justinian having been broken off, Belisarius crossed over to Italy; took Naples after a siege of twenty days; and at the end of the year 536 entered Rome, which was evacuated by the Gothic garrison on his approach. Early in 537 he was besieged there by Vitiges, the Gothic king, who had recently been raised to the throne on the deposition and murder of Theodatus, and now advanced from Ravenna with an army of 150,000 men. In the course of the siege Belisarius deposed the Pope Sylvester, whom he had detected in a treasonable correspondence with the enemy. Before the end of the siege he incurred much obloquy by his precipitate execution of Constantine, an officer of rank and reputation, who in an altercation with him respecting the restoration of some plunder, forgot himself so far as to draw his sword on his general; in this affair Belisarius is supposed to have acted rather in furtherance of the private revenge of Antonina, who accompanied him in his expeditions, than from any reasonable zeal for the vindication of discipline. Early in 538 the siege, which had been carried on for more than a year with great vigour, was raised, and Vitiges retired to Ravenna. Belisarius then proceeded in the reduction of the provinces of Italy, though much impeded by the factious opposition of his officers and by an invasion of the Franks; but in the beginning of the year 539, Narses, the leader of the faction, was recalled, and the Franks retreated after a short inroad. At length Ravenna was invested, but, when its surrender could no longer have been delayed, an embassy which had been sent by Vitiges to Constantinople returned with a treaty of partition, which left to him the title of king, and the provinces north of the Po. This treaty Belisarius refused, on his own responsibility, to execute, and the Goths, driven to despair, offered him their support if he would assume the title of Emperor of the West. By affecting compliance he gained possession of Ravenna, and the surrender of that city was followed by the submission of almost the whole of Italy. In the beginning of 540 he was recalled to Constantinople, whither he immediately repaired.

In the spring of 541 he was sent to conduct the war which had broken out with Persia, and after an indecisive campaign returned to Constantinople. In 542 he was again appointed to the supreme command in the Persian war, and at the close of the campaign again recalled, and on his arrival degraded from all his employments. During the campaign a rumour had prevailed of the death of Justinian, and Belisarius had used language unfavourable to the succession of Theodora. His treasures were attached, and he remained in momentary expectation of an order for his execution. A heavy fine was levied on his effects, but his life was spared, the pardon being accompanied by the injunction to be reconciled to his wife Antonina, against whom he was incensed for her infidelity.

In 544 Belisarius was again named to command in Italy, but with

the insufficient force intrusted to him he was unable to raise the siege of Rome, which had, since the beginning of 546, been blockaded by Totilas, the Gothic king, and was now reduced to the extremity of famine. In the end of 546 Rome was taken by treachery, but Totilas was diverted from his design of razing the city with the ground by the remonstrances of Belisarius. In the beginning of 547 Totilas advanced against Ravenna, and immediately on his departure Rome was re-occupied by Belisarius, and successfully defended by him against Totilas, who retraced his steps and endeavoured to retake it. But, though successful in the neighbourhood of Rome, Belisarius was unable, from the smallness of his means, to put an end to the war; and from the same cause he afterwards suffered so many reverses, that in the year 548 he requested that either the force at his disposal might be augmented, or he might be recalled; and the latter alternative was granted.

Belisarius, having escaped assassination by the discovery of a conspiracy, the chiefs of which dreaded his inflexible fidelity, lived for some time at Constantinople in the enjoyment of wealth and dignity. In 559 the Bulgarians invaded the empire, and he received the command of the army destined to oppose them. After checking their progress, he was removed from the command by the jealousy of Justinian, and was never after employed in the field.

In 563 a conspiracy against the emperor was discovered, in which he was accused of participating. Of his subsequent fate there are two accounts. The more probable is that given by Gibbon, that his life was spared, but his fortune sequestrated, and that he was confined to his own palace. His innocence was soon acknowledged, and his property and freedom restored, but he did not long survive his liberation; he died in the early part of the year 565. A tradition relates that he was deprived of his eyes, and reduced to beg his bread, but this is not countenanced by any authority older than the 11th century, and can be traced no further back than to an anonymous writer in Banduri's 'Imperium Orientale' (quoted by Lord Mahon, p. 467), and to Tzetzes, who wrote in the 12th century. Lord Mahon has sought to establish the truth of the tradition, but his arguments do not appear sufficiently strong to induce us to receive it. The story of the blindness of Belisarius was adopted by painters, as we might naturally expect; and Marmontel in his romance of Belisarius, and various other modern writers have contributed to give it a popular character. Belisarius had one daughter, Joannina, by his wife Antonina.

Belisarius is described as being of a majestic presence, brave, generous, and affable, and a strict lover of justice. His unshaken fidelity is sufficiently manifest from the whole course of his life. His talents for war appear to have been of the highest order, and we have few examples of such great effects produced with such small means. His character is degraded by base subserviency to his infamous wife, who appears to have been mainly concerned in the most objectionable passages of his career, and by the rapacity which marked the latter part of his life.

(Procopius; Jornandes, *De Reb. Get.*; Lord Mahon, *Life of Belisarius*; Schlosser, *Universal-historische Uebersicht*, th. 3, abth. 4; Gibbon, chaps. xli., xlii., and xliii.)

BELKNAP, JEREMY, was born in 1744. He took his degree at Harvard College, and from 1787 to 1787 was minister of Dover church in New Hampshire. He then removed to Boston, where he officiated until his death in 1798. He is the author of a 'History of New Hampshire,' and commenced an American biography, only two volumes of which were published. He wrote also a number of religious, political, and literary tracts, and was one of the founders of the Massachusetts Historical Society. He appears to have been distinguished by industry, research, and extent of knowledge, rather than by the possession of remarkable intellectual qualities.

BELL, ANDREW, was born at St. Andrews, Fifeshire, in 1752, and received his education in the university of that town. He was brought up for the episcopal church, and took orders. He passed some years in the British West Indies, and was then appointed chaplain at Fort St. George, and minister of St. Mary's church at Madras. Here he commenced instructing gratuitously the orphan children of the military asylum, and made the first attempt at the system of mutual instruction. So well was he satisfied with its success, that on his return to England he published in London, in 1797, 'An Experiment made at the Male Asylum at Madras, suggesting a System by which a School or Family may teach itself under the superintendance of the Master or Parent.' The pamphlet attracted but little attention, until in the following year Joseph Lancaster opened a school in Southwark for poor children, supported by subscription, and conducted upon this system. It was so successful that similar schools were established elsewhere. The education of the poor being undertaken on so large a scale by a sectarian, the subscribers being also in the main dissidents from the Church of England, caused some alarm in the leading members of that Church. Bell was opposed to Lancaster, and in 1807 was employed to establish schools where the Church doctrines would be taught, and to prepare books for them. Funds were provided, and the rivalry, by stimulating both parties to exertion, resulted in nothing but good; though the particular feature, that of mutual instruction with the help of a master only, has been found to require very material modifications. Dr. Bell, as a reward for his labours, was made a prebendary of Westminster. He died at Cheltenham, January 28, 1832, aged 80, and was buried

with much pomp at Westminster. The large fortune he had accumulated he left almost entirely for educational purposes. An estate of considerable value was left to Cupar, the capital of his native county, for the establishment of various schools. To the provost of St. Andrews, the two ministers of the town, and the professor of Greek in the university, he left 120,000*l.* of Three-per-Cent Stock, in trust, one-twelfth to be given to each of the towns of Edinburgh, Glasgow, Leith, Aberdeen, and Inverness, for founding and maintaining schools upon the Madras system. Another twelfth was given to the Royal Naval School upon the same conditions. Six-twelfths were given to St. Andrews to maintain schools, and to found and endow a college to be called the Madras College. This has been done. A quadrangular building, with a pleasing front, in the Tudor style, having a corridor round the inner court, has been erected, with houses for the principal masters. In it is taught English grammar, Greek and Latin, arithmetic and mathematics, geography, writing, drawing, French, German, and Italian languages, and church-music. Each department has a competent master, and some have assistants. Small fees are paid for each department, and the scholars usually average from 800 to 1000.

BELL, HENRY, an individual whose name is connected with the history of steam-navigation in this country, was born in Linlithgowshire in 1767. Dr. Cleland, in his work on 'Glasgow,' speaks of him as "an ingenious untutored engineer, and citizen of Glasgow," and states that it may be said, without the hazard of impropriety, that Mr. Bell 'invented' the steam-propelling system, "for he knew nothing of the principles which had been so successfully followed out by Mr. Fulton." Fulton however launched his first steam-boat on the Hudson October 3, 1807, and it was not till more than four years after this date that Bell successfully applied steam to the purposes of navigation. In 1811 he caused a boat to be constructed on a peculiar plan, which was named the 'Comet,' in consequence of the appearance of a large comet that year. He constructed the steam-engine himself, and in January 1812 the first trial of the 'Comet' took place on the Clyde. Dr. Cleland adds—"After various experiments, the 'Comet' was at length propelled on the Clyde by an engine of three-horse power, which was subsequently increased to six. Mr. Bell continued to encounter and overcome the various and indescribable difficulties incident to invention, till his ultimate success encouraged others to embark in similar undertakings."

Mr. Bell's experiments did not realise to himself those pecuniary advantages which were due to his enterprise. From the city of Glasgow he received in his latter years a small annuity in acknowledgment of his services to commerce and civilisation. He died at Helensburgh on the Clyde in 1830. A monument has been erected to his memory on a rock in the Clyde, near Bowling.

BELL, JOHN, generally called from his Scottish estate Bell of Anternony, was born in the west of Scotland in the year 1691. He was brought up to the medical profession, and passed as a physician in the 23rd year of his age. Shortly afterwards he began those travels to which alone he is indebted for his celebrity.

He says himself, in the preface to his valuable book, "In my youth I had a strong desire of seeing foreign parts; to satisfy which inclination, after having obtained from some persons of worth commendatory letters to Dr. Areskine, chief physician and privy councillor to the Czar Peter I., I embarked at London, in the month of July 1714, on board the 'Prosperity of Ramsgate,' Captain Emerson, for St. Petersburg." Russia then stood in need of and welcomed foreigners of talent and acquisitions. Bell was exceedingly well received by Peter the Great, for whom he ever afterwards entertained sentiments of veneration and singular affection. Peter was then preparing an embassy to Persia, and Dr. Areskine having introduced Bell to Artemy Petrovich Valensky, the ambassador, he was engaged to accompany the expedition in quality of surgeon and physician. On the 15th of July 1715 he left St. Petersburg. The embassy was obliged by the severity of the weather to halt at Kazan, which place it left on the 4th of June 1716. It then proceeded by Astrakhan, the Caspian Sea, and Taurus, to Ispahan, where the Persian monarch then held his court, and where Bell arrived on the 13th of March 1717. He did not return to St. Petersburg until the 30th of December 1718, having been absent in all three years and six months. His account of this long journey is exceedingly interesting. His love of travelling was soon further indulged by his being engaged on an embassy to China, under Leoff Vasilovich Ismayloff, who, with Bell and a numerous retinue, departed from St. Petersburg on the 14th of July 1719. They travelled by Moscow, Siberia, and the great Tartar deserts, to the celebrated Wall of China; and did not reach Pekin until sixteen months after their departure from the Russian capital, having undergone immense fatigue during the journey. On their return they left the Chinese capital on the 2nd of March 1721, and arrived at Moscow on the 5th of January 1722. The account of this journey, and of what he saw and learned during his residence at the court of China, is the most valuable part of Bell's book, and one of the best and most interesting relations ever written by any traveller. He fully confirms many of the almost incredible things told of the Chinese by the old Venetian traveller Marco Polo, with whose work Bell does not appear to have been acquainted.

Bell had scarcely recovered from the fatigues of his Chinese expedition, when, in May 1722, he started on a long and dangerous journey

with the Russian emperor to Derbent, a celebrated pass between the foot of the Caucasus and the Caspian Sea. This was the most original and singular expedition in which Peter the Great was ever engaged. Having concluded peace with Sweden he resolved to assist the Shah of Persia, whose territories had been invaded by the fierce and warlike Afghans; and he accordingly marched with an army, taking the empress with him. The Russians suffered severely during their return march, and even the emperor and his wife had some narrow escapes from the savage mountain-tribes who infested the rear and flanks of the retiring army. In the course of his account of this journey Bell introduces a short but good description of Tzercassia, or Daghestan (Circassia), and at the end of it he draws a fine character of Peter the Great, whose habits, both public and private, he had excellent opportunities of studying during the Derbent expedition. It appears that shortly after this journey Bell visited Scotland; and we do not hear of him again until 1737, when, on the failure of negotiations for peace between Russia and Turkey, he was sent on a confidential mission to Constantinople, which he undertook at the earnest desire of Count Osterman, the grand-chancellor of Russia, and of Mr. Rondeau, at that time British minister at St. Petersburg. Accordingly, on the 6th of December 1737, Bell once more quitted the banks of the Neva, and travelling in the midst of winter, and through countries exposed to all the horrors of a barbarous warfare, arrived at Constantinople, attended by only one servant, who understood the Turkish language. On the 17th of May 1738 he returned to St. Petersburg. (All his dates are according to the old style.)

We know very little more of this estimable man than what he tells himself in his book of travels, wherein he is far from being communicative as to his personal history. It appears however that he afterwards settled for some years as a merchant at Constantinople; that he married about the year 1746, and in the following year returned to Scotland, where he lived in ease and affluence on his estates of Anternony. He was a warm-hearted, benevolent, and sociable man, and he obtained from his friends and neighbours the appellation of 'Honest John Bell.' He died on the 1st of July 1780 in his eighty-ninth year.

Although he had so much to tell he was by no means anxious to distinguish himself as an author. For many years the only record of his travels was a simple diary, to which he occasionally referred to refresh his memory, for he was fond of talking about his journeys and adventures with his intimate associates. At length he was induced by the solicitations "of a right honourable and most honoured friend," to throw his notes together in the form of a regular narrative. The work, in two volumes 4to, was printed and published at Glasgow by subscription, in 1763, under the title of 'Travels in Asia.' It has been several times reprinted in various forms, and a French translation of it has been widely circulated on the Continent. It includes the translation of a journal kept by M. de Lange, a gentleman who accompanied Ismayloff to Pekin, and who remained in that city to finish the negotiations with the Chinese, for several months after the departure of the ambassador.

* BELL, JOHN, was born in Norfolk in 1800. Having completed the usual course of professional instruction, Mr. Bell commenced the practice of his art as a sculptor, by designing and modelling various poetic figures, chiefly of a classical character. But after a time he began to direct his thoughts towards modern literature and the Scriptures, and started on a new and more original career, by giving form and expression to the characters contained in them. His efforts have to a considerable extent been appreciated by the public, but Mr. Bell can hardly be said to have become popular with the connoisseurs or the patrons of art, and he has received no academic honours. His most celebrated classical figure is his Andromeda; but he also sculptured a Psyche, &c. In religious subjects he has executed among others statues of John the Baptist, David with the Sling, and the Madonna and Child. Among those illustrative of modern literature the most popular is the charming figure of Dorothea, which, in the form of a parian statuette, has been more widely distributed than any similar work, but his *Una* and the *Lion*, and his *Babes in the Wood*, similarly copied, have met with almost equal popularity. Of subjects not directly taken from books, the most ambitious, and one of the most admired, though, as we think, far from one of the most successful, is his *Eagle Slayer*; others are the *Child's Own Attitude*, now the property of the Queen; a *Child of Eve*; the *Dreamer*, &c. Mr. Bell has also executed for the new houses of parliament some historical portraits, as *Lord Falkland*, *Shakspeare*, and one or two more; and to the same class belongs his energetic figure of the *Maid of Saragossa*. But none of these are quite satisfactory; his great strength lies in the representation of graceful shrinking female figures, of a somewhat homely poetical character.

Besides his statues, Mr. Bell has made numerous designs for manufactures, chiefly of works to be executed in parian, bronze, and iron. He has also prepared a 'Freehand Drawing Book,' which has been published by the School of Design; and he has published some poetic sculpturesque designs in outline. Casts of most of his more popular statues are in the Crystal Palace at Sydenham.

BELL is the name of a family of which three brothers rose to a high rank in their several professions. John Bell, the grandfather, was minister of Gladsmair in East Lothian, the parish which was afterwards held by the historian of Charles V. He died at the early age of

thirty-two, with a high character for learning and virtue. The father, the Rev. William Bell, a learned scholar and eloquent preacher, was in the course of his education for the Presbyterian Church led, by a perusal of the English divines, to become a member of the Episcopal Church of Scotland. He was settled for many years in a small cure at Doune in Perthshire. His wife, the mother of the three gentlemen whose biographies follow, was of a family which, in a long descent, had furnished clergymen to the Episcopal Church of Scotland during its splendour and in its decay. She was a woman of masculine understanding, tempered with great mildness and gentleness of manners, and improved by an excellent education under the care of Bishop White, her maternal grandfather. There were eight children of the marriage, two of whom died in infancy. John, George Joseph, and Charles, became eminent in their several professions. The Rev. W. Bell died September 26, 1779.

JOHN BELL, the elder of the brothers, was born at Edinburgh, May 12, 1763. About a month before the birth of this son the father had submitted to a painful and difficult surgical operation; and his admiration of that science to which he owed his safety led him to devote to the service of mankind, in the medical profession, the talent of the son born while his heart was warm with gratitude for the relief which he had obtained.

John Bell was educated at the High School of Edinburgh, and at the usual age was entered as a pupil in surgery with the late Mr. Alexander Wood of that place. He was early remarkable for enthusiasm in his profession, and engaged with great ardour in whatever he undertook. During the time that Bell was pursuing his studies, the medical school of the University of Edinburgh stood very high, ranking among its professors Black, Cullen, and the second Monro. It was while attending the lectures of the last-mentioned professor that Bell saw the way to professional advancement. Monro was a zealous anatomist, and anatomy was well taught as the groundwork of medical science, but its application to surgery was quite neglected. This deficiency Bell was determined to supply; and in the year 1790, whilst yet a very young man, he built a theatre in Surgeon's-square, Edinburgh, where he delivered lectures on surgery and anatomy, carried on dissections, and laid the foundation of a museum.

As there was then scarcely any private teaching, or means of cultivating anatomy by private dissections, the establishment of a school naturally excited great hostility against Mr. Bell, every attempt at private teaching being considered as an encroachment on the privileges of the professors and the rights of the university. In his lectures he was wont to speak of some of Monro's anatomical opinions with less respect than the character of that great man deserved, and he made no scruple to expose many mistaken doctrines and erroneous practices recommended in the system of surgery of Mr. Benjamin Bell. The tone and spirit of these criticisms raised up a host of enemies among the friends of these two gentlemen.

In 1799 a pamphlet was published entitled 'Review of the Writings of John Bell, Esq., by Jonathan Dawplucker.' It was an affected panegyric of Mr. Bell's works, and was dedicated to him; but the real design was to criticise his first volume of 'Anatomy,' to represent him as a plagiarist, "to pluck from him all his borrowed feathers," and to vindicate Dr. Monro and Mr. Benjamin Bell from his criticisms. The author was supposed to be some near friend of Benjamin Bell's. Mr. John Bell published a second number, under the same name of J. Dawplucker, addressed to Mr. Benjamin Bell. It contained ironical remarks on this surgeon's system of surgery, and had such an effect on the popularity of his work that it soon ceased to be the text-book for students. At this time Mr. (afterwards Sir) Charles Bell was associated with his brother in teaching, the latter taking the surgical, the former the anatomical department.

The College of Surgeons in Edinburgh then presented a very anomalous condition. It was a college of surgery and a corporation, forming an integral part of the town-council of Edinburgh. The first character had fallen comparatively into neglect and oblivion, while the privileges belonging to the body in its relation to the burgh, exposed its members to the temptation of mixing in the politics of the town. This state of the college Mr. Bell was very anxious to alter; he wished to convert the college into a literary and scientific body, and to separate it from the politics of the city. It was a part of his plan that the college should resume the right, vested in them by their charter, of appointing a professorship of surgery, and take upon them their proper duty of watching over the interests of anatomy and surgery; that the examination should be placed on a more respectable footing; that the candidates should compose a thesis on some subject of surgery or anatomy, suggestions which have since been adopted, but the proposal of which at that time excited against Mr. Bell great opposition. The change which was at this time proposed in the surgical attendance at the infirmary, and which, on being ultimately carried into effect, proved fatal to Mr. Bell's prospects as a teacher, was supposed to have had its origin in this feeling. The members of the College of Surgeons were in rotation the surgeons of the establishment, and each surgeon during his attendance chose his own assistant for his operations, and those whose talents or inclinations did not lead them to take their share in the duties of the hospital devolved those duties on others, and thus the surgeons particularly qualified for this situation soon distinguished them-

selves. Mr. Bell, from his expertness as an operator, was among the number.

Dr. Gregory drew up a pleading or memorial to the managers of the infirmary against this system, and proposed that two or three ordinary surgeons, the best qualified that could be got, should be permanently appointed, with assistant and consulting surgeons. Mr. Bell, seeing that the proceedings were intended to affect his interests and his plans of teaching, made an appeal personally to the board of the infirmary, but in vain. In the end he found himself and his brother, with many other surgeons, deprived of the use of the institution. Mr. Bell brought the question before the courts of law, whether the managers had power to exclude him from the infirmary, and it was adjudged against him.

In 1798 he went to Yarmouth to visit those who had been wounded at Camperdown, and he there applied himself with the zeal and activity of the most devoted student to the proofs exhibited in the wounded of those great principles of surgery which it has been the business of his life to explain. In 1803 he made an offer to government for the embodying of a corps of young men, to be instructed in military surgery, and in the duties of the camp and hospital, in order to aid in the service of the country, then supposed to be on the eve of an invasion. This offer was first accepted, but subsequently declined.

After the loss of the infirmary, Mr. John Bell never resumed his lectures; he settled his mind to private study and professional occupation. He renewed his classical pursuits, and perused and enjoyed the authors of antiquity with his characteristic ardour. In 1805 he married a very amiable and accomplished lady, the daughter of Dr. Congalton, a physician long retired from practice, and he enjoyed in the society of Mrs. Bell and a large circle of friends twelve happy years in Edinburgh. Mr. Bell was always of a delicate constitution, and towards the end of this period his health declined so much that he was induced to visit the continent, in the hope of regaining his strength by travelling and relaxation. In the course of his travels through Italy he made notes of his observations, which, since his decease, have been published by his widow. He finally sunk at Rome, under the effects of his complaint, a confirmed dropsy, on April 15, 1820.

In 1793 Mr. Bell published the first volume of his 'Anatomy,' consisting of a description of the bones, muscles, and joints. In a short time afterwards the second volume was published, containing the anatomy of the heart and arteries. The work was afterwards completed by his brother Charles. His next work was on surgery, entitled 'Discourses on the Nature and Cure of Wounds,' in 2 vols., 8vo. The 'Principles of Surgery,' in 3 vols., 4to, was his next and most formidable undertaking; and his last production is the 'Letters on Professional Character and Education,' addressed to Dr. Gregory.

The great principle which Mr. Bell enunciated and established, and that on which his celebrity is founded, was that of free anastomosis as the foundation of the modern practice of the surgery of the arteries. The character of this celebrated man may be summed up in a few words. He was a man of varied talents, and possessed great energy and industry, great facility in communicating his ideas, and great acuteness and discrimination in availing himself of all that knowledge which is essential to perfecting surgical science; but he had little patience with the very slow retreat of ancient prejudices, and little acquaintance with the world, of which he was so much in advance. He was an entertaining and instructive writer, and a popular and eloquent teacher. As a controversialist he was acute and powerful; and as a writer pungent, even beyond his intention and desire. His work on Italy has shown that his talent for general literature, had it been exclusively cultivated, would have made him at least as eminent as his professional attainments have rendered him.

GEORGE JOSEPH BELL was born at Fountainbridge, near Edinburgh, on the 26th of March 1770, and was educated at Edinburgh. He became a member of the Faculty of Advocates in 1791. In 1804 he published in two volumes 8vo, 'A Treatise on the Laws of Bankruptcy in Scotland.' In 1810 he published an enlarged edition of the same work in 4to, with the title 'Commentaries on the Laws of Scotland and on the Principles of Mercantile Jurisprudence considered in relation to Bankruptcy, Composition of Creditors, and Imprisonment for Debt.' For the third edition of this great work in 1816, he received the rare honour of a vote of thanks from the Faculty of Advocates, conveyed to him officially by their Dean. Six editions of this work were called for, a test of merit unprecedented in a large and expensive book so exclusively professional. Mr. Bell also wrote the 'Principles of the Law of Scotland,' which has likewise gone through many editions; and 'Illustrations of the Principles of the Law of Scotland,' &c. These were designed for the instruction of his pupils in the university, but they, as well as his commentaries, soon became standard text-books in the law courts, were constantly referred to as authorities by the judges from the bench, and were quoted as conclusive in argument at the bar, not only of his own country, but of England and America.

Mr. Bell was a member of a Commission of Legal Inquiry in 1823, and in consequence of its report, he was called on by the Secretary of State, Mr. (afterwards Sir Robert) Peel, to take an active part in introducing and carrying out important changes in the administration

of civil justice in Scotland. In 1833 he was appointed by Lord Melbourne, chairman of another gratuitous royal commission, which was afterwards twice renewed, and from their investigations and reports, the recent improvements in the laws of Scotland have been derived.

In 1821 Mr. Bell was appointed Professor of the Law of Scotland in the University of Edinburgh, and in 1831 a principal Clerk of Session. He had married in 1806 Barbara, daughter of Charles Shaw, Esq., who predeceased him. He died at Park Place, Edinburgh, on the 23rd of September 1843, leaving eight children. One of his sons, George Joseph Bell, Jun., held the Radcliffe Travelling Fellowship of Oxford. He was an eminent scholar, an accomplished artist, and an M.B. of Oxford. For three years he was physician to her Britannic Majesty's mission to Persia, where he received from the Shah the order of the Lion and Sun, for his distinguished medical services. His health suffered from the climate, and on his way home he died, unmarried, at Erzerum, on the 12th of May 1847, in the thirty-seventh year of his age.

SIR CHARLES BELL was born at Edinburgh in 1774. Charles, being the youngest brother, did not receive quite the same academical advantages of education as his brothers, in consequence of the death of his father when he was very young. But as he himself said well in after-life, "My education was the example set me by my brothers;" and most gratefully he always acknowledged the lessons which his mother bestowed on him, her favourite child. At the High School of Edinburgh Charles made no marked figure. It was under the eye of his brother John, whose profession he had adopted, that he first gave evidence of his great talents. He became a first-rate anatomist, and lectured to some hundred pupils on that science while comparatively a boy. His internal consciousness of ability, however, and the ambition inseparable from it, led him to long for increased opportunities of exertion, and in the year 1804, at the age of thirty, he removed to London. Perhaps the bitter dissensions then raging in the Edinburgh Medical School, in which his brother John was deeply involved, had some effect in prompting him to this escape to a new scene.

At the outset, the prejudices then prevalent against Scotsmen, seem to have stood in the way of Charles Bell in London, but he overcame them in time, and became intimate with Sir Astley Cooper, Abernethy, and other great surgeons of the day. His work on the 'Anatomy of Expression,' published in 1806, did much to give him a name in London; and most deservedly so, that treatise being acknowledged by Wilkie, and many illustrious painters, as having deeply influenced their own studies and practice in drawing the human figure. Nevertheless, though advancing by slow yet sure degrees as an operative practitioner, Bell was forced to begin lecturing in a very humble way, having yet obtained no aid from association nor any connection with the chief medical schools. In the same year (1807) in which he entered on this course, he published the first edition of his 'System of Operative Surgery,' a work which was rendered valuable by its practical character: no single operation was described theoretically, but all from full personal experience; and it is still one of the most useful works on the subject. At this period, in some beautiful letters to his brother George Joseph Bell, he describes the dawning upon his mind of those discoveries in the nervous system, which will form his noblest monument in the judgment of posterity. But he also grieves most bitterly, in this correspondence, over the neglect with which the public, generally, treated these early speculations. We may once for all observe, regarding this series of fraternal letters, that if no other proof of the writer's genius existed, they would form in themselves satisfactory testimony to his abilities. His frequent aspirations "to be chief of his profession in character" indicate a man of no common stamp.

In 1811 he married Marion, daughter of Charles Shaw, Esq., of Ayr, a lady who brought happiness to his hearth, and several of whose relatives became eminent in their various departments. To Alexander Shaw, also a surgeon, we owe an able vindication of the just claims of Bell in the field of anatomical and physiological discovery. In the same year (1811) Bell became connected with the Hunterian School in Windmill-street; and in 1814 he was appointed surgeon to the Middlesex Hospital, an institution which he subsequently raised to the highest repute, and which he justly boasts, in 1836, of leaving "with full wards, and 120,000*l.* in the funds." It was both from his extraordinary skill as an operator, and from his style of lecturing—which, though not especially eloquent, was striking and suggestive—that his labours were crowned with success, both as regards the patients and the pupils of the Middlesex Hospital.

Bell had early distinguished himself as a scientific surgeon and adept operator. He had been much engrossed by the consideration of cases in military surgery, when our wounded troops came home from Spain. The battle of Waterloo revived his enthusiasm in this branch of his art; he visited the battle-field immediately after the battle, and was of great service to the wounded.

In 1821 Bell's first paper on the 'Nervous System' was read before the Royal Society, and published in the 'Philosophical Transactions.' It attracted immediate attention all over Europe, and the value of his discoveries being recognised, many came forward to claim them and contest their originality. It was easy to prove however that he had been in the habit of teaching these doctrines for many years to his pupils, and his views had been explained in a paper written so far

back as 1810, of which 150 copies, privately printed, were circulated among his friends.

The older anatomists believed all nerves alike capable of conveying motion and sensation—the essence of Bell's discovery was that every nerve has a distinct function according to the part of the brain or spinal marrow with which it is connected. Although sometimes as many as three different nerves are bound up together in the same sheath, for convenience of distribution to the organs they are intended to supply, and though after they have become thus united it is impossible to distinguish one fibril from another, yet at their connections with the brain and spinal marrow their several roots are quite distinct. He showed that those roots which are connected with the back part of the spinal marrow are all nerves of feeling, and incapable of giving power of motion to the muscles, in short that they are the bearers of messages from the body to the brain: whereas all the roots of nerves connected with the front, or anterior column of the spinal marrow and that portion of the brain connected with it are nerves of voluntary motion only, and the messengers of the will to the body. He farther discovered that there are nerves which arise from a portion of the brain and spinal marrow intermediate between the sensitive and the motor tract of nervous matter, whose office it is to regulate the involuntary motions connected with respiration and the expression of the passions. In like manner the nerves of the special senses, seeing, smelling, and hearing, enter distinct portions of the brain that form as much parts of the organs of these senses as the eye, nose, or ear. Such is the general outline of his discoveries, which opened up to the anatomist and the naturalist hitherto concealed avenues to knowledge, and afforded a guide, previously wanting, to the surgeon in his operations; and rescued the whole treatment of nervous disorders from the dominion of mere empiricism.

Before quitting this subject—in which Bell may be named as a discoverer equal even with Harvey—we ought to point to one of the practical inferences from his own views, which establishes the existence of a sixth sense—that by which we attain our knowledge of distance, size, weight, form, texture, and resistance of objects. Two of his essays, 'On the Nervous Circle,' and 'On the Eye,' have reference to this theory. The basis of it is, that the nerves of sensation play the part of reporters on the motor nerves, and indicate to the central seats of perception the condition of things within the influence of these nerves, thus forming the sixth or muscular sense.

Numerous were the hints which the genius of Bell threw out to the profession about this time, in lectures and short essays. The operation for the cure of squinting, for example, by division of the contracted muscle of the orbit, had occurred to him long before it was thought of by the German who now has the credit of the discovery, as letters before us fully prove. The existence of a vital attraction betwixt the solids and fluids of the body was also an idea of Bell. But his discoveries on the nerves certainly established his reputation. In 1824 the London College of Surgeons offered to him their senior chair of anatomy and surgery, which he accepted; and his lectures, which were received with great applause, formed the basis of a work entitled 'Animal Mechanics,' published in 1828-29, by the Society for the Diffusion of Useful Knowledge. Two other works, which combine high scientific knowledge with such a popularisation of the subjects as fitted them to ordinary capacities, followed soon afterwards; the one is the 'Bridgewater Treatise on the Hand,' and the other 'Illustrations of Paley's Natural Theology,' an accompaniment to Lord Brougham's work on that subject. In the meantime Bell was in the first rank of his profession, and had an ample attendance on his lectures, not only of pupils, but of men his seniors in practice. On the continent he was even more highly esteemed. Cuvier, Larrey, and other illustrious men of science, vied with one another in testifying their admiration of his talents and his labours. On the accession of William IV. he was one of those selected for the honour of knighthood with Herschel, Brewster, and others. When the London University (now University College) was established, he was offered the chair of Physiology, and he accepted the offer; but after a short period he gave in his resignation. For some time subsequently, he chiefly pursued his private professional practice, with a reputation firmly established. He had still the same ardent desire, which was the passion of his youth, to prosecute experimental physiology; and, accordingly, when an offer of the chair of Surgery in the Edinburgh University was made to him, he accepted it, though after much doubt and reluctance. His regret at quitting his London friends was great, but it was overbalanced by the hope of spending his latter years happily among those friends who had been dear to his youth, and still more so by the expectation of being again placed in a position to renew with effect his scientific studies.

Sir Charles Bell removed to Edinburgh in 1836, having been absent thirty-two years. His opening lecture as Surgical Professor was brilliantly attended by professional and non-professional men of eminence; and the conduct of his class fulfilled all the high anticipations he had formed respecting it. He had "meditated a splendid work on the Nervous System," but he did not find means for its accomplishment; and the only great work which he did finish was a new edition of his 'Anatomy of Expression,' largely increased and improved by his observations on an Italian journey undertaken by him in one of the intervals betwixt his sessions at college. In the summer of 1842 Sir Charles

set out on a journey to London. He reached the seat of Mrs. Holland, of Hallow Park, on the 27th of April, where he died on the night of his arrival. His death was not altogether unexpected. He had recently suffered much from *angina pectoris*, a disease of some standing in his case. It was aggravated, there is every reason to believe, by disappointments consequent on his settlement in Edinburgh; and also by anxieties connected with the New Medical Reform Bill, much of which he believed to be at variance with the interests of that profession and science to which he was so strongly attached.

* BELL, THOMAS, an eminent naturalist, was born on the 11th of October, 1792, at Poole, Dorsetshire, in which town his father had a large practice as a surgeon for more than fifty years. His mother came of a good family, named Gosse, resident in Hampshire. To her entirely he owed his elementary education, and his early love of natural history, she herself being warmly attached to that interesting science. He first went to school in his native town, and afterwards at Shaftesbury, where he remained until entering on his professional studies with his father. In 1814 he became a student at Guy's Hospital, and was admitted a member of the College of Surgeons, and of the Linnæan Society in the following year. In 1817 he commenced a course of professional lectures at Guy's, which he has continued without interruption to the present time. Some years later he, for the first time in London, taught comparative anatomy as a separate subject to a class which he formed in the same school.

In 1825 Mr. Bell joined with Sowerby, Children, and Vigors, in establishing the 'Zoological Journal,' of which five volumes were published, with a beneficial effect on the advancement of zoological science in this country; and conjointly with Kirby, M'Leay, and other zoologists, he originated the zoological club of the Linnæan Society, which met at the society's rooms on the Tuesday evenings not occupied by the ordinary meetings. This club was afterwards merged in the scientific department of the Zoological Society, though not without detriment to the zoological phase of the Linnæan Society.

Mr. Bell was one of the earliest fellows of the Geological and Zoological societies, and sat in the council of the latter for eleven years, the greater part of the time as vice-president. In 1836 he was appointed Professor of Zoology in King's College, London, when he ceased his lectures on comparative anatomy at Guy's. In 1827 he communicated a paper to the 'Philosophical Transactions': 'On the Structure and Use of the Submaxillary Odoriferous Gland in the genus *Crocodilus*,' in which, among the facts of the structure, he suggested a use for the gland, namely, that its secretion, being odoriferous, had the effect of attracting within reach of the animal's jaws the fish that became its prey. In 1828 he was elected a Fellow of the Royal Society; was chosen on the council in 1839-41, and again in 1847. In the following year he was elected secretary of the society, and held the office till his election as president of the Linnæan Society in 1853. This honourable post he still retains. He was elected an honorary Fellow of the College of Surgeons in 1844, and has been president of the Ray Society from its establishment.

As an author, Mr. Bell has added largely to the literature of his favourite science. Many valuable papers from his pen are to be found in the 'Zoological Journal,' and in the 'Transactions' and 'Proceedings' of the Zoological, Geological, and Linnæan societies. Of his other works the most important are—'History of British Quadrupeds,' 8vo, 1836; 'Monograph of the Testudinata,' folio, 1833; 'A History of British Reptiles,' 8vo, 1829; 'Reptiles' in the Zoology of Darwin's Voyage of the Beagle; 'A History of the British Stalk-Eyed Crustacea,' 8vo, 1853.

BELLA, STEFANO DELLA, a celebrated Italian engraver, was born at Florence in 1610. He worked until his thirteenth year in the shop of Orazio Vanni, a goldsmith, when his own inclination, and some instruction he received in painting from his master's son, Gio. Battista Vanni, and in engraving from Cantagallina, induced him to give up the intention of following the business of a goldsmith, and to follow the arts. He accordingly applied himself to painting under Cesare Dandini, but he eventually adopted etching as his profession.

Some of Della Bella's works having attracted the notice of Lorenzo de' Medici, the brother of the Grand Duke Cosmo II., that prince sent him to complete his studies in Rome, where he remained three years, and etched many views of that city. After his return from Rome he went in the suite of the Tuscan ambassador to Paris, where he remained eleven years, and executed there many of his best etchings, by which he obtained a great reputation. His subjects are battles, sieges, animals, sea-pieces, landscapes, and ornaments. They are executed with freedom, with great delicacy, and are also well drawn, and he had a fertile and happy invention. Cardinal Mazarin wished to retain him at Paris, and offered him the situation of drawing-master to Louis XIV., then a child. But he returned to Florence about 1647, and became drawing-master to the Prince Cosmo, afterwards Grand-Duke Cosmo III., a post which he held until his death in 1664. He was one of the best masters of the etching-needle, and executed about 1500 different works; and though he did so much, what he did was done well. Before his death he grew melancholy: his last works were six etchings of the *Havoc of Death*, which however he did not quite complete. There is a portrait by Della Bella in the Pitti palace of the Grand-Duke Cosmo III. His own portrait by Stocade has been engraved by Hollar.

One of his most valued etchings is a large view of Pont-Neuf, Paris, which, as originally issued in 1646, is very scarce.

(Gandellini, *Notizie Istoriche degl' Intagliatori*, &c.; Heineken, *Dictionnaire des Artistes*, &c.; Huber, *Manuel des Amateurs*, &c.)

BELLAMY, MRS. GEORGE ANN, an actress of some celebrity. Her mother, whose name was Seale, after having been the mistress of Lord Tyravley, married Captain Bellamy, and a few months after her marriage gave birth, on St. George's Day 1733, to the subject of this article: this unexpected occurrence occasioned Captain Bellamy immediately to separate from her. The daughter was educated in a convent at Boulogne till she was eleven years of age, when she returned to England. Rich, the manager of Covent Garden Theatre, overhearing her reciting the part of Othello to his children, was struck by her voice, and brought her out at the age of fourteen in the part of Monimia in the tragedy of 'The Orphan.' As an actress she drew the attention of the town for some seasons, particularly when she played Juliet with Mr. Garrick at Drury Lane, against Mrs. Cibber with Barry at Covent Garden. Her life, a memoir of which she wrote and published in 6 vols. 12mo, was a series of misfortunes and errors. She died February 15th 1788 at Edinburgh, in great distress, aged 55.

BELLAMY, JAMES, was born at Flushing of poor parents in 1757. As a boy he showed a great inclination for a military life, but being the only son of his mother, she put him to the trade of a baker, which he was still following, when in the year 1772 the second secular festival in commemoration of the foundation of the republic was celebrated throughout Holland. This event suddenly made him a poet. His first verses were effusions of patriotic feelings and love for his native country. Some wealthy citizens of Flushing were so much pleased with these first productions of the young poet that, to encourage his talent, they resolved to send him at their own expense to a university. Accordingly, after the necessary preparation for academical lectures, he went to Utrecht, with the intention of studying divinity. These studies however he soon left for the more congenial pursuits of poetry and general literature. A society of students, among whom Kleyn and Rau afterwards distinguished themselves, the first as a juriconsult, the second as an orientalist, was then formed at the university, which had for its object the cultivation and improvement of the Dutch language and poetry after the German model: at the head of this society stood our poet. It was at Utrecht also, in the year 1785, when his country was involved in war, that our poet published his 'Vaderlandsche Gezangen' (patriotic poems), which bear high testimony to his ardent imagination, superior taste, and facility in poetical composition. Previous to the year 1785 he had already published several pieces of merit, sufficient to induce the Society of Arts at the Hague to insert them in their collections. He also wrote a series of amatory poems, entitled 'Gezangen myner Jeugd' ('Songs of my Youth'). Although Bellamy died before his genius had reached its maturity, he still must be ranked among the first poets of his nation, and the restorers of modern Dutch poetry. A presentiment, which he had of his approaching death, seems to account for a morbid sentimentality which his latter works betray. He died in 1786, at the age of 28. A short account of his life, together with two of his speeches, has been published by G. Kniper.

BELLARMIN, ROBERT, CARDINAL, was born at Monte Pulciano in Tuscany, in the year 1542. He entered the order of Jesuits in 1560; was ordained priest at Ghent by the celebrated Jansenius in 1569; and elected Professor of Theology at the University of Louvain in the year after. Having filled this chair for seven years with increasing celebrity, he returned to Rome in 1576, where he gave lectures on controversial theology. The Jesuits were at the time the great defenders of the church of Rome against the doctrines of Luther and the Protestants; and to their learning, ability, zeal, and worldly wisdom that church was mainly indebted for its vigorous stand against the assaults of the divines of the Reformation. In 1590 Bellarmin, who had, says Bayle, "the best pen for controversy of any man of his age," accompanied the pope's legate into France, for the purpose of affording the papal cause the aid of a master of the controversial points of divinity. In 1599 he was made a cardinal. Three years afterwards he was created archbishop of Capua, which see he quitted in 1605 for Rome, where he resided till his death in 1621, an active member of the court of the Vatican.

The controversial works of Bellarmin are very numerous, filling three large folio volumes. Of their merits, and of the merits, intellectual and moral, of their author, a very favourable opinion has been given by the learned and candid Mosheim. A much less favourable opinion was expressed by Scaliger in a criticism which has called down the just animadversions of Bayle (note L. art. Bellarmine), who cannot well be suspected of any bias in favour of the Jesuit. Scaliger had ventured to assert that Bellarmin did not believe a word of what he wrote, and that he was at heart an atheist; but, besides the strong testimony of his life and death-bed to the contrary, such judgments are, as Bayle well remarks, a usurpation of the rights of Him who alone is the judge of hearts, and before whom there is no dissembling.

Besides the controversial works to which we have alluded, the Cologne edition, 1617, of Bellarmin's works contains three folio volumes of other works, in addition to a volume of sermons and letters.

BELLENDEN, SIR JOHN, eldest son of Thomas Bellenden, Bellenden, Ballantyne, or Bannatyne (for by all these names is this family known), of Auchinvoile, a lord of session, director of the chancery, and justice clerk of Scotland. He was some time secretary to Archibald Douglas, earl of Angus, lord chancellor and prime minister of Scotland, in the beginning of the 16th century. When Angus was, in September 1528, indicted for high treason, of the many that had previously waited on him Bellenden alone continued his friend, and, though not a lawyer, drew up the defences for him. But all his pleas and defences were overruled, and he was found guilty by the parliament, and attainted; in March 1542-43 however, the attainder was reversed, Crawford says, on the grounds taken in the defences, and Angus restored to his estates and honours.

Bellenden immediately after had the honour of knighthood conferred upon him; and on his father's death he was, in June 1547, appointed to the vacant places of a lord of session, director of the chancery, and palace-clerk. On the breaking out of the Reformation he was named by the Queen Regent one of the commissioners between her and the lords of the congregation; but he soon joined the reformers, and, in August 1560, he and Wishart of Pittarrow are mentioned in Randolph's dispatch to Cecil, as the two whom they had resolved to join in a mission to France. On Mary's arrival in Scotland he was, 6th September 1561, appointed one of the privy council. In December following he was one of those named to modify stipends to the reformed clergy—the mean allowance for whom roused the indignation of Knox. On the 23rd September 1563, he and Sir John Maxwell, the warden of the West Marches, met the English commissioners at Dumfries, where they entered into a convention for redressing the mutual trespasses on the borders. (Nicolson, 'Border Laws.') On the 31st May 1565, Sir John obtained a grant of the office of usher of the exchequer—an office which seems to have remained in his family till 1796, when, on the insolvency of the fifth lord Bellenden, it was attached, and sold by the creditors. The same year Sir John had a grant of the office of justiciar and bailie of the baronies of Canongate and Broughton, and other lands belonging to Holyrood House; and the next year the commendator made him justiciar and bailie of Calder, belonging to the same abbey.

Among the numerous reports to which the murder of Rizzio gave rise, one was, that the Bellendens were implicated in the crime; and in the despatch from Randolph and the Earl of Bedford to the privy council of England, 27th March 1566, it is said—"There were in this company two that came in with the king, the one Andrew Car of Fawdonside, whom the Queen sayth would have stricken her with a dagger, and one Patrick Balentyne, brother to the justice-clerk, who also, her grace sayth, offered a dag against her belly with the cock down;" but it is added, "We have been earnestly in hand with the Lord Ruthon to know the varietie, and he assureth us to the contraria." It would seem however that Sir John Bellenden fled from Edinburgh on the 18th March 1566, on the arrival of Mary and Darnley with an army, but he was soon restored to favour. He carried Mary's commands to Mr. John Craig, the famous fellow-minister of John Knox, to proclaim the bans between her and Bothwell. The marriage was solemnised on the 15th May 1567 by Adam, bishop of Orkney, who afterwards joined the association against Mary and Bothwell; and in July following anointed and crowned the infant James. Sir John Bellenden joined the association likewise; and also became one of the regent's privy-council. In 1573 he was employed in framing the pacification of Perth, whereby all the queen's party, except Kirkcaldy of Orange, Lethington, and those with them in Edinburgh Castle, were brought to the king's obedience. The same year he was, it seems, employed in a still more difficult affair, namely, to persuade the General Assembly on the behalf of Morton, that the civil magistrate ought to be head of the church as well as of the state. The discussion was continued for twelve days and then adjourned. (Horne, 'History of the House of Douglas.')

Sir John died some time before April 1577, leaving by his first wife two sons, on the eldest of whom, Lewis, he by his later will, dated in 1567, laid an injunction to serve the regent and the house of Angus, under the king's majesty's obedience, "as I and my forbearis haf done, in tymes bypast, befor all the world." Sir Lewis succeeded his father in his possessions, and in his place of justice-clerk.

BELLENDEN, WILLIAM, an eminent writer, concerning whose birth and education we possess no certain information except that he was of Scotch family, and became known as a writer in the commencement of the 17th century. It is stated that he filled the office of Professor of Humanity in the University of Paris in 1602, and that he was enabled to reside at that university through the favour of James VI. (James I. of England). It is certain that he resided a long time in Paris, and that the various writings which have transmitted his name down to us were published during his residence there. In 1608 he published his 'Ciceronis Princeps,' &c., "a singular work," says Dr. Bennett, bishop of Cloyne, "in which he extracted from Cicero's writings detached remarks, and compressed them into one regular body, containing the rules of monarchical government, with the line of conduct to be adopted, and the virtues proper to be encouraged by the prince himself." This treatise, which is called 'De Statu Principis,' he dedicated to Prince Henry, the eldest son of his royal patron. In 1612 he published a work of a similar character, which

he called 'Ciceronis Consul, Senator, Senatusque Romanus,' that is, 'De Statu Reipublice,' in which the nature of the consular office, and the constitution of the Roman senate are perspicuously treated. Finding these works deservedly successful, he set about a third work, 'De Statu prisci Orbis,' which was to contain a history of the progress of religion, government, and philosophy, from the times before the Flood, to their various degrees of improvement under the Hebrews, Greeks, and Romans. He had proceeded so far as to print a few copies of this work in 1615, when he resolved to unite them into one work, by republishing the two former, and entitling the whole 'Bellendenus de Statu.' With this view he recalled the few copies of his last work that were abroad, and, after a short delay, published the three treatises under their new title in 1616. A copy of the original edition of the 'De Statu prisci Orbis,' dated 1615, is in the British Museum. Unfortunately the vessel in which the whole impression of his great work was embarked was overtaken by a storm before she could reach the English coast, and foundered with all her cargo. A few copies only, which Bellenden had kept for his own use, or made presents of, were saved; and accordingly the work, from its scarcity, was hardly known to even the most curious of book collectors.

Bellenden, though naturally much concerned, was not, it seems, discouraged at his loss; but immediately set about arranging his materials in a new form. His studies had made him familiar with the works of the great Latin writers, particularly Cicero; and he designed a work with the title 'De Tribus Luminibus Romanorum,' in which he proposed to explain the character, literary merits, and philosophical opinions of Cicero, Seneca, and Pliny the elder according to some, the younger according to other critics. The first of these he finished, and was proceeding with the others when he died. The republication of the three original works above-named of 'Bellendenus de Statu' in 1787, with a preface remarkable for its Latinity, and still more, perhaps, as being the vehicle of much fierce political invective from the pen of Dr. Parr, has made Bellenden's name more familiar to the English reader than it otherwise might have been. In his preface, Parr affirms that Middleton, in his 'Life of Cicero,' borrowed largely from Bellenden, without making any mention of his name.

BELLI'NI is the name of a family of painters, a father and two sons. JACOPO BELLINI, the father, was born in Venice. He was one of the earliest practitioners in oil-painting, and an artist of considerable merit. He adorned the public edifices of Venice with a great number of pictures, the principal of which were a series of subjects from the New Testament in the church of St. John the Evangelist. He was distinguished in portrait-painting, and among many other eminent persons who sat to him were Lusignano, king of Cyprus, and the Doge Cornaro. He died about 1470.

GENTILE BELLINI was the eldest son of the preceding, and born at Venice in 1421. He studied under his father, and subsequently gained such reputation by his original works that he was employed, in conjunction with his brother, Giovanni, to decorate the great council-chamber of the Venetian senate-house. His other principal works are the Histories of the Holy Cross at San Giovanni, and the Preaching of St. Mark, painted for the college of that saint, and now in the Pinacoteca at Milan. This latter work ranks in colouring and effect among the finest of its time. But it is deficient in refinement, and disfigured by extravagant anachronisms in character and costume. His Presentation of the Infant Jesus at the Temple, in the Palazzo Barberigo, is a highly-esteemed performance. Some of Bellini's pictures were taken by commercial speculators to Constantinople, where, having been seen by the sultan, Mohammed II., that monarch sent an invitation to the artist to make a visit to his court. This proposal was accepted by Bellini; he was courteously received by the sultan, who sat to him for his portrait, and commissioned him to paint various historical works. A strange story is told by his biographers that one of his pictures, the Decollation of St. John, was greatly admired by Mohammed, but having discovered some inaccuracy in the marking of the discovered neck, in order to prove the justice of his criticism, ordered the head of a slave to be struck off in the presence of the astonished artist. From this moment it is added Bellini never enjoyed an hour's tranquillity until he had obtained leave to return to Venice. Mohammed dismissed him with many marks of favour, placing a gold chain round his neck, and giving him letters to the Venetian senate expressive of his satisfaction. During his residence in Constantinople he struck a medallion of the sultan. He was engaged in various public works after his return to Venice, for which he was requited by the republic with an honourable pension for life, and the order of St. Mark. He died in 1501, aged 80.

GIOVANNI BELLINI, the son of Jacopo, and the brother of Gentile Bellini, was born at Venice in 1422. He was the best artist of his family, and contributed more than any painter of his time to prepare the way for the grander style of art arrived at by Titian and Giorgione. Giovanni Bellini painted in the first instance in distemper, but on seeing the oil-paintings of Antonello da Messina, who settled at Venice in 1570, he recognised the superiority of the new vehicle, which he at once acquired the knowledge of, and thenceforward continued to employ. His first public works were those in the Venetian senate-house, in the decoration of which he was associated with his brother, Gentile: these were destroyed by fire in 1577. Giovanni ornamented

the public edifices and churches of Venice and other cities of Italy with a prodigious number of paintings, and continued his labours to a very advanced age. Among his most distinguished works are altar-pieces in the Sacristy of the Conventuali and at San Zaccaria at Venice; and in the monastery of the Capuchins in that city is a picture of the Infant Jesus slumbering in the lap of the Madonna and attended by angels—a work conspicuous for its grace, beauty, and expression. To these may be added a Virgin in the cathedral of Bergamo; a Baptism of our Lord at Santa Corona, at Vicenza; Christ and the Woman of Samaria at the Well, in the Schiarra Palace at Rome; and a Bacchanalian piece in the Cammucini collection in that city. In all these works the elements of a finer style are more visible than had been practised either by Perugino, Ghirlandaio, or any of his immediate contemporaries. Bellini introduced a more ample style of drapery, he generalised his colour, and gave breadth to his masses; and although he fell short of the excellence which was soon after attained by Giorgione and Titian, he claims the honour of having been the teacher of those great masters. Some of his small pictures are in England; but it is only by his large works in Italy that an adequate idea of his powers can be formed. He died at the age of ninety, in 1510. A portrait of the Doge Loredano by Giovanni Bellini is in the National Gallery.

BELLI'NI, LAURENTIO, was born at Florence September 3, 1643. After receiving in his native place the elements of a classical education, he proceeded to Pisa, to enjoy the advantages which the Grand Duke Ferdinand II. granted to those who were disposed to study the sciences. At this time the doctrines adopted in order to explain the functions of the human body were derived from the sect of mathematical physicians, who ascribed them to mechanical principles. The leader of this sect was Borelli, then professor of mechanics and anatomy at Pisa. Under him, and also under Alexander Marchetti, professor of mathematics, Bellini studied, and imbibed their opinions. The doctrines of this school were maintained for a considerable time, and were partly adopted by Boerhave; but since the writings of Haller and Hunter, they have been exploded. Bellini however made such rapid progress, that when only twenty years of age he was appointed professor of philosophy at Pisa. Shortly afterwards he was made professor of anatomy, and was frequently honoured with the attendance of the grand duke at his lectures. He continued to teach anatomy and to practise medicine at Pisa, with great success, for thirty years, when he was invited to Florence, and made chief physician to the Grand Duke Cosmo III. At the recommendation of Lancisi, physician to Pope Clement XI., he was nominated senior consulting physician to that pontiff. His reputation was also extended to foreign countries both by his writings and pupils, one of the most distinguished of whom was Dr. Archibald Pitcairn, successively professor at Leyden and Edinburgh, who introduced and maintained the doctrines of his master in these celebrated schools, where they held sway for a considerable time. Bellini died on the 8th of January 1704.

The writings of Bellini are now little read. The best is the treatise 'Gustus Organum novissime deprehensum,' Bononiae, 1665, in which he pointed out the papillae of the tongue to be the essential organ of taste. The next most important is entitled 'De Urinis, Pulsibus, Missione sanguinis, febribus,' &c., Bononiae, 1683. His works have been collected and published in two volumes, 4to, 'Opera Omnia,' Venetiis, 1708, and reprinted in 1732.

Bellini possessed a taste for music and poetry, and was the author of a poem called 'Bucchereide,' which was published after his death at Florence in 1729.

(Sprengel, *L'Histoire de la Médecine*; Haller, *Bibliotheca Medicinæ Practicæ*; Fabroni *Vita Italorum*.)

BELLINI, VINCENZO, a celebrated composer, was born in November 1802, at Catania, in Sicily, near the foot of Etna. The family were musical, and the young Bellini showed so much talent that he was sent to study at Naples, at the expense of the town of Catania. He was admitted into the Conservatorio at Naples in 1819. His first efforts at composition drew the attention of Zingarelli, the director of the institution, and he removed him into his own class. He however was disappointed, for Bellini was idle, and inattentive to the orthodox rules of harmonic combinations, though he subsequently made laudable efforts to compensate for this neglect. He dissected the quartets of Haydn and Mozart, a labour as interesting as useful to those who would penetrate the secrets of modulation, and the adjustments of parts. He also composed symphonies and psalm-tunes. In 1825 he produced an opera, 'Andelson e Salvinia,' which was performed within the walls of the Conservatorio, and which showed the germs of a genius not yet developed. A cantata, 'Ismenée,' received such applause, that Barbaja, the manager of the San Carlos theatre at Naples, confided to Bellini a libretto, 'Bianca e Gerardo,' for which he was to compose the music. It was played in March 1826, and obtained a brilliant success. He was now regularly engaged for the theatre of La Scala at Milan. In 1827 'Il Pirati' was produced there, and was warmly received. It does not however rank high as a work of art; the instrumentation poor, the harmonies faulty, but some of the melodies are delightful. 'Le Straniera' followed at Milan; 'Zaire' was brought out at Parma; and 'I Capuletti ed i Montecchi' at Venice. But 1831 saw Bellini's greatest triumph; in this year was produced 'La Sonnambula' in March, and 'Norma' in December, both of them at Milan.

They were received with enthusiasm, and quickly became popular in other parts of Europe. For a year Bellini rested, and in 1833 produced 'Beatrice di Tenda;' this was a comparative failure,—a gloomy subject, with a mournful ending, was not within the compass of Bellini's genius. The story is the fate of Anne Bullen, with Italian names. His reputation however suffered little from this check, and the Académie Royale de Musique in Paris applied to him to compose an opera for them. Bellini went to Paris, then crossed over to England to superintend the performance of one of his own operas, returned, and in 1834 produced 'I Puritani,' in which he made great advances in the knowledge and practice of his art. Shortly after this brilliant effort, while residing at a house in the country, he was attacked by a violent intestinal disorder, which carried him off in a few days. He died at Pateaux, near Paris, on the 23rd of September 1835, aged 32 years, and was buried in the cemetery of Père la Chaise, after a solemn funeral service had been performed in the church of the Invalides.

Bellini's moral character stood high, and his manners and compositions were in strict accordance;—agreeable, tender, and elegant. He rarely attempted the brilliant, and never aspired to the sublime, or even lofty, yet in most of his productions are traits of genius. A sweetness of melody, a fitness of harmony, and an adaptation of the sound to the sense, characterise all those of his works which have come under our notice. His constitutional tendencies seem to have been adverse to that vigorous exertion of mind which in a more healthy state he might have exhibited: and it may be, that had he not been cut off in almost his youth, his ambition would have led him to attempt something that might have secured to him the privilege of being heard in future times.

BELLMANN, CHARLES MICHEL, a Swedish poet, was born at Stockholm in 1741, and died in 1796. He studied at the University of Upsala, and after he had left it was enabled to devote himself entirely to his favourite pursuits of poetry and literature by the liberality of Gustavus III., who appointed him to a nominal office, with a competent income, and the title of Secretary of the Court. The king had already favourably noticed Bellmann's earliest productions, which were a metrical translation from the German of Schweidnitz's 'Evangelical Dying Thoughts' ('Evangelische Todesgedanken'), published when he was only sixteen; and a poem entitled 'Zion's Högtid' (the 'Festival of Zion'). To these, some years afterwards, were added—'Bachi Tempel' (the 'Temple of Bacchus'), the most important of his poems; Friedmann's 'Epistel og Songer;' and a Swedish translation from the German of Gellert's 'Fables.' His posthumous works—'Skaldestykker' ('Poems'), and Friedmann's 'Handskrifter' ('Manuscripts')—were published, the first at Stockholm, 2 vols, 1812, and the second at Upsala, 1813. Bellmann's poetical pictures generally represent scenes of the lowest life in Sweden; but they are so chaste, so true, so full of imagination, and their colours are so lively, that the reader forgets the scenes of vulgarity to which he is introduced, and finds himself suddenly transported from low tap-rooms to cheerful habitations of joy and song. To enter however fully into the spirit of Bellmann's lyrical productions, it is necessary, not only to read them, but also to hear them sung to the tunes which were composed expressly for them. Bellmann had a heart open to friendship, he was a cheerful companion, and bore a good moral character.

BELLOT, JOSEPH RENÉ, was born at Paris, in March 1826. His father, who was in humble circumstances, removed to Rochefort when Joseph was five years old. Joseph was placed in the elementary school of that city, and so favourably a report was made by his schoolmaster at the close of his term of instruction that the municipality at once granted him a demibourse at the College of Rochefort. Here his progress was equally satisfactory; so that when his college term ended, in his 16th year, and he proceeded to the naval school at Brest, the municipality of Rochefort continued to contribute a moiety of the expense. He was two years at the naval school, and on quitting it took rank as fifth on the list at the final examination. Having served six months in port, he received his commission as 'élève de marine' on board the corvette 'Berceau,' bound for the Isle of Bourbon. It is worthy of remark, as characteristic of Bellot's excellent disposition, that, before leaving France, out of his slender salary he assigned to his family the sum of 20 francs a month.

Bellot remained abroad somewhat over three years, returning home in November 1847. During this time, while steadily pursuing his private studies, he had, by the diligent discharge of his official duties, secured the esteem and approbation of his superior officers. M. Romain Desfossés, the commodore, to whom Bellot had acted as aide-de-camp, in his official dispatch to the minister of marine, pronounced Bellot to be "the most distinguished élève on the station, . . . and in every respect superior to his age and position." Distinguished merit in a young officer is seldom neglected by the French government. For his conduct and bravery in the expedition against Tamative, Madagascar, in July 1845, in which he had been wounded, he had been already promoted to be an élève of the first class, and, though under twenty, created a Chevalier of the Legion of Honour; and now on returning home with the high commendation of M. Desfossés, he was raised to the rank of sub-lieutenant.

The following summer Lieutenant Bellot sailed in the corvette 'Triumphante' to South America, where he remained for about two

years. His conduct here affords a fine lesson for the young officer, whatever service he may be in, and to whatever country he may belong. His strictly professional duties, and they were very onerous, were most carefully and sedulously performed, and he obtained, as before, the warmest commendations from his superiors. But his own time was carefully husbanded and admirably employed. He not only extended his knowledge, especially in hydrography and geography, but taught himself to speak English, Spanish, and German fluently; and withal, gave up much time and thought to what he had come to regard as an important part of an officer's duty—the training of his subordinates. So far indeed did he carry this, that, both here and on the African station, his biographer informs us, "he gave on board the vessel a course of lectures on geometry and navigation for all those seamen who, being intended for masters of trading vessels, would have to pass on their return the examination in theory and practice required by the rules of the marine."

Bellot's thoughts were now turned to a new sphere of operations. The search after Sir John Franklin and his gallant comrades had directed general attention to the Polar Regions. When he found that his own government would not, as he had hoped, aid in the search, he asked for and obtained permission to volunteer his services in the expedition fitting out, chiefly at the expense of Lady Franklin, under Mr. Kennedy. His services were gladly accepted, and he sailed in the schooner 'Royal Albert' in the beginning of June 1851, holding no declared rank, but really second in command, with the understanding that he was to act as chief officer in case of Captain Kennedy's death. Of this voyage Lieutenant Bellot left a full and very interesting journal, which has been published under the editorship of M. de la Roquette, along with his memoirs. The 'Royal Albert' was ice-bound in Fury Bay for 330 days, and was compelled to return without having obtained any tidings of Sir John Franklin; but the expedition was so far successful as to have ascertained that Sir John could not have proceeded in the direction indicated for their search, and every man was brought home alive and in good health.

Bellot had displayed in this, as on every previous service, the most intelligent and devoted attention to its duties, and had secured the hearty good-will of both officers and seamen. In England he was received with an amount of enthusiasm for which he was little prepared, and his own government marked its approbation by raising him a step in rank. But he was not disposed to rest on his laurels. He again obtained permission to volunteer in a new searching expedition, and in June 1853 set out in the 'Phoenix,' Captain Ingfield. They anchored safely in Erebus and Terror Bay, where they found lying the 'North Star,' but its commander, Captain Pullen, had been for a month away from his ship on an exploratory journey. Captain Ingfield resolved to set out in search of Captain Pullen, but the latter returned shortly after Ingfield's departure. It now appeared very desirable at once to forward, if possible, the despatches, which it had been a principal object of the expedition to convey, to Sir Edward Belcher. In the absence of his captain, Lieutenant Bellot volunteered to conduct this perilous undertaking. He accordingly set out with four sailors, a canoe, and a sledge. A few days later, on the 18th of August, while crossing the ice, about three miles from the shore, off Cape Bowden, they were caught in a gale, became separated, and Bellot, with two of his companions, drifted on a broken piece of ice towards mid-channel. After cheering his companions as well as he was able, Bellot crossed to the opposite side of the hummock to see how the ice was drifting. As he did not return, one of the sailors went after him; but he was not to be seen, and he was never seen again. His stick lay on the other side of a wide crack, into which he had no doubt been driven by the violence of the wind. His companions happily escaped.

Thus, at the age of twenty-six, was lost one of the most promising men who have adorned the French navy. The news of his sad end was received with general sorrow in both countries. Here a meeting was held, at which resolutions, expressive of admiration and regret, were moved and supported by the First Lord of the Admiralty, the President of the Geographical Society, and various eminent naval officers and scientific men; and a subscription was authorised for raising a testimonial to his memory. The testimonial took the form best calculated to do him honour. Out of the funds a handsome granite obelisk, bearing his name, was placed in front of the gates of Greenwich Hospital; and to each of his five sisters a sum of about 200*l.* was appropriated. The French government provided for his two brothers.

(Lemer, *Memoir of Lieutenant Joseph René Bellot, &c.*)

BELON, PIERRE, one of the fathers of natural history on the revival of letters, was born at Souletière, a village in the French province of Maine (now the department of Sarthe), somewhere about the year 1518. Deservedly great as is the fame which he acquired, nothing seems to be known concerning his family. Medicine and botany were his studies at a very early period of his life; and the bishops of Mans and of Clermont, and afterwards the cardinals of Tournon and of Lorraine, were his patrons. To them he owed his education, the means of travelling, and the opportunities of publishing the observations which he so well knew how to make.

He visited Germany, Bohemia, Italy, Greece, Egypt, Palestine, and Asia Minor, and appeared in Paris, after three years of absence, in

1550, with a fine and extensive collection, which he arranged: he then proceeded to publish his works. In 1567 he traversed Italy, Savoy, Dauphiné, and Auvergne. In 1564, when he was about forty-five years old, he was cut off in the midst of his useful career by the arm of an assassin as he was returning to Paris. The Bois de Boulogne was the scene of this murder.

It would be out of place in a work of this description to give a catalogue of his various and excellent publications. The sciences of botany, zoology, geography, and antiquity, were all enriched by his labours. Henry II. and Charles IX. of France reflected honour on themselves by the esteem which they showed for this celebrated man, who was far in advance of the age in which he lived.

BELSHAM, THOMAS, a dissenting minister of the Unitarian persuasion, was born at Bedford in April 1750. On his mother's side he was descended from the Earl of Anglesey: his father, the Rev. James Belsham, was a man of classical attainments. After studying for five years at the Dissenters' Academy at Daventry, then under Dr. Ashworth, Mr. Belsham was appointed assistant tutor in that academy, an office which he held for seven years. He was then chosen pastor of a church at Worcester, where he remained for three years, when he returned to Daventry Academy as theological tutor and head of the institution. This office he continued to fill from 1781 to 1789, and at the same time was minister of the Society of Protestant Dissenters at Daventry. His views had hitherto been Calvinistic, but he now embraced Unitarianism, and in consequence resigned his connection both with the academy and with his congregation. About this time, a new college being established at Hackney, it was placed under the direction of Mr. Belsham, but in a few years it sunk for want of funds to support it. Before this event took place he was chosen to the vacant pulpit of Dr. Priestley by the Gravel Pit congregation, where he again entered upon those exertions which were most congenial to his tastes. Eleven years afterwards, in 1805, on the death of Dr. Disney, the colleague and successor of Mr. Lindsey, Mr. Belsham removed to Essex-street chapel, London, of which he continued the pastor during the rest of his life.

From the time that Mr. Belsham avowed his conversion to the doctrines held by the Unitarians he espoused their cause with great zeal, and applied his talents and learning to its defence. One of his earliest publications was 'A Review of Mr. Wilberforce's Treatise, entitled A Practical View of the prevailing Religious System of Professed Christians,' &c., 1798, in which it was the writer's design to place the theological doctrines maintained by the author of the 'Practical View' in contrast with those professed by Unitarians. In 1811 he published a work entitled 'A Calm Inquiry into the Scripture Doctrine concerning the Person of Christ.' His single sermons, on subjects chiefly suggested by public events, would make up several volumes, and his controversial writings are numerous. There is hardly any branch of theology, or of the doctrines or evidences of revelation, on which Mr. Belsham has not published his thoughts. His 'Evidences of the Christian Revelation' is a powerfully argumentative and sometimes eloquent work, which had a large sale, and was perhaps the most popular of his performances. His last work, and that perhaps on which his reputation must rest, was 'A Translation of the Epistles of Paul the Apostle, with an Exposition and Notes.' He had been previously employed on a work of which he is now known to have been the editor, 'The Improved Version of the New Testament.' But Mr. Belsham's literary works were not exclusively theological. In 1801 he published 'Elements of the Philosophy of the Human Mind and of Moral Philosophy.' As a follower of Hartley, he resolved all mental phenomena into the association of ideas. Besides his numerous obituary sermons, he published 'Memoirs of the late Rev. Theophilus Lindsey, M.A., including a Brief Analysis of his works,' &c., 1812. Mr. Belsham died at Hampstead on November 11th, 1829. (*Memoirs of the late Rev. Thomas Belsham*, by John Williams, 8vo, 1833.)

BELSHAM, WILLIAM, an active writer on politics and history, brother of Thomas Belsham, was born in 1752, and died Nov. 17th, 1827 at Hammersmith. He resided at one period at Bedford, and was intimately acquainted with several of the most celebrated public men belonging to the Whig party, to whose politics he was strongly attached. His literary career commenced in 1789, by the publication of a series of 'Essays, Historical, Political, and Literary,' in 2 vols. 8vo. These were followed by 'Letters and Essays,' published at various periods, on the 'Test Laws,' the 'French Revolution,' the 'Distinction between the Old and New Whigs,' 'Parliamentary Reform,' and the 'Poor Laws.' In 1793 he published, in 2 vols. 8vo, 'Memoirs of the Kings of Great Britain of the House of Brunswick-Lunenburg.' In 1795 he again appeared as an historical writer, by the publication of 'Memoirs of the Reign of George III., to the Session of Parliament ending 1793,' in 4 vols. 8vo. To these were added the fifth and sixth volumes in 1801. In 1798 he published, in 2 vols. 8vo, a 'History of Great Britain from the Revolution to the Accession of the House of Hanover;' and in 1806 his historical works were published in a uniform edition in twelve 8vo volumes, under the title of 'History of Great Britain to the Conclusion of the Peace of Amiens in 1802.' He was also the author of numerous other productions of an historical and political character, none of which are now often referred to. (Watt, *Bibliotheca Britannica*.)

BELZONI, GIOVANNI, was a native of Padua, but of a family

originally from Rome, as he himself states in the preface to his work on Egypt. He passed his early youth at Rome, where he intended to enter the monastic life, but the French invasion of that city in 1798 altered his purpose, and in the year 1800 he left Italy, and visited in succession several parts of Europe. In 1803 he arrived in England, where he soon after married: and after nine years' residence in England, during part of which he gained his living by exhibiting feats of strength, he set off with his wife for Portugal and Spain, from whence he proceeded by way of Malta to Egypt, where he arrived in 1815. His object in going to Egypt was to construct an hydraulic machine to supersede the clumsy engines then used in that country for irrigation. He proposed his plan to Mehemet Ali Pasha, by whom it was approved. Belzoni constructed a machine in the pasha's garden at Zubra, near Cairo, and the experiment proved successful, but owing to the prejudices and opposing interests of the natives, it was abandoned before it was completed. Belzoni then decided upon visiting Thebes, and his intention becoming known to Mr. Burckhardt, the latter gentleman prevailed upon Mr. Salt, the British consul, to employ Belzoni to remove the colossal bust, commonly but incorrectly called the Young Memnon; which he accomplished with great ingenuity, placed it in a barge, which sailed down to Rosetta, and thence to Alexandria, where it was shipped for England. This head, now in the British Museum, is one of the finest specimens of Egyptian colossal sculpture. Belzoni, on his return to Cairo, received a present through Burckhardt, half of which was paid by Mr. Salt. Before embarking the colossus Belzoni made an excursion higher up the country, visited the great temple of Edfu, and the islands of Elephantine and of Philæ, and proceeded into Nubia as far as the second cataract. He was the first to open the great temple of Abousambul, or Ipsambul, which is cut in the side of a mountain, and the front of which was so much encumbered by the accumulated sand, that only the upper part of it was visible. In 1817 Belzoni made a second journey into Upper Egypt and Nubia, during which he made excavations at Carnak, on the eastern side of the Nile, and found there a colossal head of granite, several statues, an altar with basso-relievi, sphinxes, &c. The colossal head and an arm ten feet in length, both belonging to one colossus, are now in the British Museum. But one of the greatest discoveries of this enterprising traveller was the opening of a splendid tomb in the Beban-el-Molouk, or Valley of the Tombs of the Kings. He discovered the right entrance, which had been blocked up for many centuries, had it cleared, and at last made his way into the sepulchral chambers cut in the calcareous rock, and richly adorned with pictures in low relief, and hieroglyphics painted in the brightest colours. Belzoni made drawings of the chambers, took impressions in wax of the figures and hieroglyphics, noting carefully the various colours, and thus constructed a perfect fac-simile of this magnificent tomb, which was afterwards exhibited in London. He also brought to England a sarcophagus of arragonite, which he found in a chamber of the great tomb. Mr. Salt paid Belzoni's expenses in these undertakings, besides giving him a remuneration, and received for his share part of the antiquities which Belzoni collected, and among the rest the sarcophagus, which he subsequently sold to Mr. (afterwards Sir John) Soane the architect for 2000*l.* (See the 'Life and Correspondence of Salt,' by J. Hall.) Belzoni also opened numerous other sepulchres excavated in the ridge of rocks at Gournou, at the foot of the Libyan Mountains, near western Thebes. He gives in his 'Narrative' a most graphic and interesting account of the difficulties and labour he had to encounter in this enterprise.

Belzoni's next undertaking was the removal of an obelisk from the island of Philæ, the shaft of which was twenty-two feet long, and two feet wide at the base, which he accomplished with no other aid than poles, rotten palm ropes, and a few ignorant Arab peasants. He placed it in a boat, and contrived to pass it safely down the falls of Assouan. The obelisk was removed at the expense of Mr. William Bankes, who erected it at Kingston Hall in Dorsetshire. Belzoni discovered also the entrance into the second great pyramid of Jizeh, and penetrated into the central chamber, the existence of which was before unknown, though it appeared, from an inscription found there, that it had been entered by the Arabs.

In September 1818, he again left Cairo, went to Esné, and thence struck across the Desert to the shore of the Red sea. He there discovered the ruins of the ancient town of Berenice, and visited likewise the emerald mines of Mount Zabarrah. In the following year (1819) he went on another excursion to Lake Morris, and thence to the smaller Oasis, which lies due west of it. No European was known to have visited the spot before him. He left Egypt in September 1819, after a residence of five years, during which he made numerous and important discoveries.

Belzoni returned to Italy, and visited his native town, Padua, the citizens of which had a medal struck, with the date of that year, 1819, in commemoration of his discoveries. On his arrival in England, he published his 'Narrative of the Operations and recent Discoveries within the Pyramids, Temples, Tombs, and Excavations in Egypt and Nubia,' 4to, London, 1820, with an Atlas. In 1823 he set off once more for Africa, with the intention of penetrating to the city of Timbuctoo. He undertook this journey on his own account, unassisted by any government or society. He landed at Tangier, accompanied by his wife, and thence proceeded to the city of Fez. Messrs. Briggs of

Alexandria contributed 200*l.* towards the funds for the expedition: but the jealousy of the Moorish or Jewish traders prevented his obtaining permission from the emperor to join the great caravan, which assembled here to cross the Desert to Soudan. He then repaired to Mogadore, and embarked for Cape Coast, whence he proceeded to the Bight of Benin, which he seems to have guessed was the most direct way to reach the Niger. There he met with a negro from Kasbna, who had been a sailor on board the 'Owen Glendower' frigate, and who was returning to his own country. Belzoni and he agreed to travel together to Houssa. Belzoni was well received by the king of Benin, who gave him much useful information for his journey. Everything seemed favourable to his undertaking, when he was attacked by a dysentery, which, after a few days, terminated his life on the 3rd of December 1823, at a place called Gato, in the kingdom of Benin. He was buried there under a large tree, and a simple inscription was placed on his tomb. The day before his death he wrote to his friend Mr. Hodgson, who was on board the brig 'Swinger' in the Bight of Benin, intrusting him with some directions concerning his property, and with his last affectionate farewell to his wife. Belzoni was frank and kind-hearted, trusty and honourable, and to great simplicity of manners united intelligence, firmness, and perseverance. He was certainly one of the most enterprising and sagacious of modern explorers, but he appears to have been apt to take offence, and to have been too prone to suspect the intentions of those with whom he came in contact.

BEM, JOSEPH, was born at Jarnow, in Galicia, in 1795. After having studied in the university of Cracow, in 1810 he entered the military school at Warsaw, directed at this period by the French general Pelletier; and from this school, at the end of two years, he issued as an officer of the horse artillery. In 1812 he served as lieutenant in the army under Davoust, and subsequently under Macdonald, with whom he was during the siege of Hamburg. Russia having violated the capitulation, he was forced to return to Poland, residing with his father, who had an estate near Kielce. When the kingdom of Poland was again constituted, Bem resumed his military duties. In 1819 he was created a captain, and became aide-de-camp to General Bontemps. He was next made professor in a school of artillery newly established at Warsaw. Here he introduced into the Polish army the use of the Congreve rocket, and published a work upon this instrument of destruction. Soon afterwards he solicited to be removed from this school, but the Grand-Duke Constantine, who treated this demand as an act of insubordination, had him brought to trial before a court-martial, which condemned him to prison. He was however released, but sent to Ketzik, and placed under the surveillance of the police.

After the death of Alexander, Bem obtained his dismissal, and went to reside at Leopold in Galicia. There he devoted himself entirely to science, and commenced a work on the steam-engine. When the revolution of 1830 broke out, Bem immediately betook himself to Warsaw, where he was at once made a major in the Polish army; and shortly afterwards was appointed to the command of a battalion of horse artillery, in which capacity, in the face of a numerous enemy, he displayed all the knowledge of a tactician with the bravery of a soldier. After the defeat of the Polish army he led the remnant towards France, and here he remained for a considerable period in exile, gaining his living by teaching mechanics and mnemonics. He afterwards undertook to raise a Polish legion for Dom Pedro in his expedition to Portugal, but the attempt proved a failure. He himself repaired to Lisbon, where an attempt was made on his life; the ball aimed at him was arrested by a piece of money in his pocket.

On the commencement of the revolution in 1848, Bem at first attempted to organise the insurrection at Vienna, and afterwards joined himself to the Hungarian party. Charged with the command of an army to oppose the Austrians on the side of Transylvania, he at first experienced some checks, but in March 1849 he made himself master of Hermannstadt, took Cronstadt, and repulsed the Austrian army, though joined by that of Russia, called to its assistance in the previous February. He also compelled the Austrian general, Puchner, to abandon the Banat and Wallachia. The Austrians and Russians rallied in Transylvania; and after attempting in vain to excite the Wallachians and Moldavians to rise, he was attacked and defeated at Segesvar by a greatly superior force under Lüders, the Russian general. He however succeeded in re-assembling his forces, and on August 5, 1849, he a second time possessed himself of Hermannstadt, which however he could not retain for want of reinforcements. At the desire of Kossuth he entered Hungary, and on August 8 took part in the battle of Temesvar, in which the Hungarians were defeated.

Bem then, with others, took refuge in the Turkish territories, embraced the Mussulman faith, was favourably received by the Sultan Abdul-Medjid, and was raised to the dignity of a pasha, with a command in the Turkish army. In November 1850 he exerted himself at Aleppo, where he and several other converts had been ordered to reside, in repressing the sanguinary excesses committed by the Mussulman population on the Christian residents. On December 10 in the same year he died in that town, leaving a reputation for extraordinary ability as a general, and a valour that has seldom been surpassed.

(*Nouvelle Biographie Universelle.*)

BEMBO, PIETRO, was born at Venice in 1470. His father was a

patrician of Venice, and a man of considerable taste for elegant literature. Pietro, who showed an early disposition for learning, studied at Padua and at Ferrara, and afterwards went to Sicily, where he learned Greek from Agostino Lascaris at Messina. On his return to his native country he repaired to the little town of Asolo, near Treviso, which had become the residence of Caterina Cornaro, the widow of James Lusignano, the last king of Cyprus, who, having resigned her kingdom to the Venetian senate, was enjoying a splendid income, with the title of Queen, and holding a sort of little court in that pleasant retirement. She was a woman of elegant taste and refined education. In September 1496 she gave some splendid entertainments on the occasion of the marriage of her favourite lady in waiting, to which she invited many persons of distinction, and among others young Bembo, whose family was related to hers. According to the usages of chivalry still in fashion in that age, some of the hours of leisure between the banquets, tournaments, and other pageants, were employed in learned or witty conversations, and especially in speculative discussions on the subject of love, some praising it as the source of human happiness, others blaming it as the cause of much misery, &c. From these disquisitions Bembo derived the plan of a work, which he styled 'Gli Asolani,' from the name of the place. It purports to be a collection of what was said in those entertainments by the several disputants on the nature, qualities, and effects of love, distinguishing the pure sentiment from the grossness of the passion that goes by that name, and ending in a moral strain on the contemplation of divine love, or the love between the Creator and his creatures. The metaphysical part of the reasoning is derived from Plato's philosophy, which was in high favour at that time among the learned of Italy. This work of Bembo was received with considerable applause, and the book is still esteemed as a specimen of good Italian prose.

Bembo's father wished him to devote himself to the civil service of his country, by entering on some official employment, in which his noble birth and connections would have enabled him to aspire in course of time to the highest dignities of the republic. Bembo however preferred going to Rome, and becoming a candidate there for ecclesiastical preferment, as better suited to his taste for study. His father opposing his design, Bembo resolved to devote himself to the monastic life, and for that purpose repaired to Urbino, near which was the abbey of La Croce dell' Avellana. At Urbino Bembo was so kindly received by the then Duke Guidobaldo di Montefeltro and Elizabetha Gonzaga, his consort, that he changed his mind, and took up his residence at their court, which was distinguished both for the personal character of the sovereigns and for the encouragement which they gave to the learned. Here he began to write Italian poetry, in which he imitated the style and the harmony of Petrarch; and here also he became intimately acquainted with Giuliano de' Medici, third son of the great Lorenzo, and afterwards duke of Nemours, who was then residing at Urbino. After the death of Duke Guidobaldo, which was soon followed by that of his duchess, Bembo and Giuliano agreed to proceed to Rome.

Soon after Bembo had arrived at Rome, Cardinal de' Medici, brother to his friend Giuliano, was raised to the pontifical chair under the name of Leo X. The new pontiff appointed as his secretaries Bembo and the learned Sadoletto. The briefs, letters, and other official acts which the two secretaries wrote in the name of the pontiff, were distinguished for their classical style, carried almost to fastidiousness. Rome was at that time the seat of dissipation and licentiousness, as well as of learning. Bembo shared in the common propensity, and several of the Latin verses which he then wrote are stained by indecent images and expressions. His elegy on Galatea is one of the best specimens of his Latin poetry. After Leo's death in 1521, he went to Padua, where he fixed his residence. Leo had amply provided him with ecclesiastical benefices; and Bembo, who was now enabled to gratify his taste for literature and the arts, became a munificent patron of learning, and collected a rich library and a cabinet of rare medals. At Padua he completed his work on the Italian language, at which he had laboured assiduously for many years: 'Prose di M. Pietro Bembo, nelle quali si ragiona della Volgare Lingua, divise in tre libri,' Venezia, 1525. This work is one of the earliest works on the rules of the Italian language: it has gone through many editions, and is still much esteemed. Bembo's Italian poems were published some years after, 'Rime di M. Pietro Bembo,' Venezia, 1530. In 1530, the Council of Ten commissioned Bembo to write the history of the Venetian republic, beginning from the year 1457, where Sabellico had left it. Bembo wrote it in Latin, and carried it to the year 1513, 'Historia Veneta,' libri xii. He afterwards wrote an Italian translation of his work: 'Historia Viniziana, volgarmente scritta,' which was published after his death at Venice, in 1552, with a life of the author. This translation was long after republished, in 1790, by Morelli, the librarian of St. Mark, in 2 vols. 4to, with many corrections from Bembo's autograph, and with a fine likeness of the author, engraved by Bartolozzi from a painting by Titian.

Bembo had been for many years settled at Padua in studious retirement, after renouncing the licentiousness of his early years, as well as all prospects of ambition, when in 1539, Pope Paul III. unexpectedly sent him a cardinal's hat. More perplexed than pleased at his promotion, Bembo took time to consider whether he should accept of it; he had as yet taken only the minor orders, which are not binding for

life. He however accepted it, and at Christmas 1539, he was ordained presbyter, when he received the insignia of the cardinalship, and proceeded to Rome, where he chiefly resided for the remainder of his life. He died at Rome in 1547, in his seventy-eighth year, and was buried in the church of Santa Maria super Minervam. His friend Girolamo Quirini raised a splendid monument to his memory in the church of St. Anthony of Padua. Of Bembo's three illegitimate children, whom he had during his residence at Rome in the pontificate of Leo X., one died young; another, called Tommaso, became a churchman; his daughter Elena married Pier Gradenigo, a Venetian nobleman. Bembo was intimate with Della Casa, Castiglione, Sadoletto, and most of the Italian literati of his age. His epistolary correspondence, both Latin and Italian, was published in parts, and at different times.

(*Epistolarum Familiarum libri VI. et Epistolarum Leonis X. Pont. Max. nomine scripturarum, libri XVI.*, 8vo, Venetiis, 1552; *Bembi et Sadoleti Epistolarum liber unus*, Florentiæ, 1524; *Lettere di Pietro Bembo*, 4 vols. 8vo, Venezia, 1552.)

BENAVIDES was a native of Quirihue, in the province of Concepcion, in Chili. Himself and a younger brother entered the patriot army at the beginning of the revolution. The elder brother attained the rank of a sergeant in a Buenos Ayres battalion. In 1814 both brothers were found guilty of some capital offence, and sentenced to death. Being placed in the condemned cell, they contrived to escape, and went over to the royalists, in whose service they were the scourge of Chili for four years. At the battle of Maypo in 1818 they were made prisoners, but not being recognised till the Chilean general had offered a general amnesty to all military offenders, they escaped unpunished. The supreme director, however, desiring to rid the country of them, sent the brothers with a strong escort to the province of La Plata. Not far from Santiago the officer of the escort, discovering that the prisoners had attempted to bribe the men in charge of them to let them escape, ordered them both to be executed. The two brothers, tied together, were made to kneel on the ground, and a volley was fired upon them. The younger Benavides was shot dead; the elder was struck by two shots, and wounded by a sword-cut, but life was not extinct. The soldiers threw some loose earth and stones on the bodies, and continued their march. Benavides, when he found that his executioners had left him, with great difficulty threw off the earth and stones, and having untied the cords with which he was fastened, stripped his dead brother of his shirt, in order to bind his wounds with it. Notwithstanding the acute pain of his wounds, he was able to reach the hut of a poor old man, where, without any other cure than washing his wounds every day with water, in little more than two weeks he found himself strong enough to undertake his journey. He set out accordingly towards Santiago, and contrived to enter the city secretly. Here he obtained an interview with General San Martin, and engaged to serve in the patriot army, the general having first given him a written promise that he would keep his name secret.

San Martin sent Benavides to General Valcarce, then commanding the republican forces near Concepcion, with an order to place him on his staff, and, while keeping a sharp eye over him, to avail himself of Benavides's knowledge of the country, of his great influence over the Araucanian Indians, and of his former connection with the Spaniards. To Benavides's advice and counsel the patriots were indebted for the conquest of the district of Lajas, and of the Fort del Nacimiento. General Valcarce made Colonel Freire, then governor of Concepcion, acquainted with the secret, and that officer, in a warm discussion with Benavides, had the imprudence to tell him that a man of his character was not to be trusted. Irritated at the insult, Benavides disappeared two days after, and went over to the Spaniards. General Sanchez, who commanded the Spanish forces on the frontier of Chili near Concepcion, gave him a commission in Arauco, and from that moment Benavides commenced the most cruel and desolating war against the independent Chilians. In the space of two years, with the help of the Araucanian Indians, he committed cruelties upon the patriots too revolting to relate. In 1821 the Chilians armed an expedition against him, and Benavides, being abandoned by all his followers, sailed for Arica, with the intention of joining the Spaniards in Peru. His launch having entered a cove near Valparaiso in quest of water, one of his own men betrayed him. He was taken and executed at Santiago on the 23rd of January 1823.

(*Memoirs of General Miller.*)

BENBOW, VICE-ADMIRAL, was born in 1650. His whole life, from boyhood to his death, was spent in active service at sea; and though he was by no means a very successful or brilliant commander, he was distinguished throughout his career for his courage and professional enterprise. He early attracted the favourable notice of James II., the great reformer of our naval service; and after the revolution was much employed by King William. The service by which Benbow is best known in our naval history was his last. On the 11th of July 1702 he left Port Royal in Jamaica in quest of a French squadron commanded by M. du Casse, a brave and skilful officer. On the 19th of August Benbow came up with the French force, and though inferior in number and weight of metal, immediately attacked them. A running fight was kept up for four days, but owing to the cowardice or treachery of the officers under his command, the brunt of the engagement was thrown upon Benbow's own vessel. On the morning

of the fifth day he renewed the chase and fight, but was wounded by a chain-shot, which broke his right leg to pieces. He was carried below, but very soon ordered his cradle to be brought upon the quarter-deck, so as to command a view of the action as he lay there. The engagement lasted till it was dark; but so far from receiving any assistance from his officers, they addressed a written remonstrance to him, in which they declared the inability of the English force to contend with that under Du Casse. Thus counteracted, he sailed back to Jamaica, had the officers immediately put under an arrest, and tried by court-martial. They were condemned on the clearest evidence; two of the captains were shot, and the rest were visited with various degrees of punishment. Benbow survived just long enough to hear his own conduct vindicated and applauded. He died of the wound in his leg, on the 4th of November 1702.

BENEDICT, ANTIPOPE (*Pedro de Luna*), a native of Aragon, was made a cardinal by Gregory XI. After the death of that pope, when the great schism broke out between Urban VI. and Clement VII., De Luna attached himself to the latter. After Clement's death in Avignon in 1394, the cardinals of his party elected De Luna as his successor, in opposition to Boniface IX., who had succeeded Urban at Rome, and he assumed the name of Benedict XIII. France and several other states which had acknowledged Clement now acknowledged Benedict, with the understanding that he should renounce his dignity whenever required for the peace of the church. But De Luna had no intention of fulfilling his part of the engagement. Meantime both Boniface and his successor Innocent VII. died at Rome, and the king of France and other sovereigns were anxious to put an end to the schism. The cardinals at Rome however elected Gregory XII., and he and Benedict excommunicated each other. A council, held at Pisa in 1409, deposed both popes and elected Alexander V., who dying soon after, the conclave assembled at Bologna and elected John XXIII. John was in his turn deposed for irregularities by the council of Constance, who elected as his successor Martin V. Benedict was still acknowledged in Spain, and he continued to assert his right to the pontificate, and excommunicated his rivals. He resided at Peniscola with a few cardinals of his own appointment. At last, in 1424, Benedict died at the age of ninety. Some of his cardinals elected as his successor an obscure individual, whom they styled Benedict XIV., of whom nothing is known; while others appointed another successor, who called himself Clement VIII., but soon after made his submission to Martin V., who was at length acknowledged by the whole western church.

BENEDICT I. succeeded John III. in the see of Rome in the year 575. His name was *Bononus*, and he was a native of Rome. Little is known of him, except that he was on friendly terms with the emperor Tiberius II., and that Rome in his time was threatened both by the Longobards and by the Vandals. He died in 578, and was succeeded by Pelagius II.

BENEDICT II. succeeded Leo II. in 684. He waited nearly a year before his nomination, which took place in 683, was confirmed by the emperor Constantine IV., without which confirmation he could not be consecrated. Constantine however exempted the Roman see from the customary tribute which was paid at the election of every new bishop, and he is said also to have ordered that in future the new bishops elected by the Roman clergy and people should be ordained without waiting for the imperial confirmation. Benedict is reported to have been pious and charitable, and well learned in the Scriptures. He restored and adorned several churches at Rome, namely those of St. Peter, Santa Maria ad Martyres, &c. Benedict died in 685, and was succeeded by John V.

BENEDICT III. succeeded Leo IV. in 855. Between these two popes some writers, and Platina among the rest, have placed the famous female Pope Joan, whose story is now acknowledged by all parties to have been a fable first promulgated, not by Protestant writers, as is often imagined, but by one Martinus, a Pole, and a Cistercian monk, who was penitentiary to Pope Innocent IV. in the 13th century, and who wrote a 'Chronicon Summorum Pontificum,' and another work on the antiquities of Rome, which is full of absurdities.

The election of Benedict III. was violently opposed by a party among the clergy of the Roman provinces, who nominated Anastasius, a Roman priest. The emperor Louis II. being appealed to, sent his missi, or deputies, to inquire into the matter; but the deputies meeting first with the partisans of Anastasius decided in his favour, and Anastasius, making his solemn entrance into Rome, occupied the Lateran Palace, stripped Benedict of his pontifical garments, and put him in prison. The clergy and the people however were united in favour of Benedict, and the imperial deputies, probably better informed than at first of the merits of the question, drove Anastasius away, and confirmed the election of Benedict. During Benedict's pontificate, Rome suffered a great inundation from the river Tiber, which was followed by a destructive epidemic disease. The Saracens at the same time were ravaging Apulia and Campania. Benedict died in 858, and was succeeded by Nicholas I.

BENEDICT IV. succeeded John IX. about the year 900. The crown of Italy, after the extinction of the Carolingian dynasty, was disputed between Berengarius, duke of Friuli, and Louis, son of Boson, king of Arles or Provence. Louis, having obtained the advantage,

came to Rome in 901, and was crowned Emperor and King of Italy by Benedict; but in the following year Berengarius, who had taken refuge in Germany, returned and defeated Louis at Verona, and took him prisoner. Benedict died in 903, and was succeeded by Leo V.

BENEDICT V. was elected in 964 by the Romans, in opposition to Leo VIII., while the latter was gone to the north of Italy to ask the emperor Otho's support against his predecessor John XII., who, after being deposed by an assembly of the Roman clergy for his irregular conduct, had returned to Rome and driven Leo from his see. John, after putting to death or cruelly mutilating several of his opponents, died suddenly, and the Romans, regardless of their previous election of Leo VIII., nominated Benedict. Otho quickly appeared before Rome with an army, and reduced the city by famine. A new assembly of the clergy was convoked, Benedict's election was declared null, and Leo was reinstated in his see. Benedict was exiled by Otho to Germany, and he died soon after at Hamburg in 965. By several writers he is considered only as an intruder, but in papal chronologies recently published in Italy he is placed among the regular popes.

BENEDICT VI. succeeded John XIII. in 972. The emperor Otho I. soon after died in Germany, and the Romans, released from the fear of that powerful sovereign, broke out into their wonted tumults, and imprisoned Benedict. He was strangled in the castle of St. Angelo in 974. Cardinal Boniface, who is said by some authorities to have caused the death of Benedict, assumed the papal dignity, but was shortly afterwards expelled, and fled to Constantinople. Donus II. is mentioned by some writers as the next pope, but nothing is known of him, except that he died after a few months, and was succeeded by Benedict VII.

BENEDICT VII., of the family of Conti, was elected in 975. On being chosen pope he assembled a council and excommunicated the anti-pope Boniface. During his pontificate the emperor Otho II. came repeatedly to Rome, while he was engaged in the war against the Greeks of Apulia and the Saracens of Calabria. Otho died at Rome in 983, and was buried in the vestibule of St. Peter's church. Benedict died about the same time, and was succeeded by John XIV. The chronology of the popes in the 10th century is rather confused, and the dates are not exactly ascertained.

BENEDICT VIII., of the family of Conti, was a native of Tusculum. He was elected pope in 1012, but was driven from Rome by the adherents of Gregory, a rival candidate. Being supported by the emperor Henry II., Benedict soon returned, and in the following year (1013) Henry and his consort Kunegund came to Rome, where they received the imperial crown from the hands of the pope. In 1016 Benedict was engaged in a war with the Saracens from Sardinia, who had committed ravages in Tuscany. They were defeated, and the Saracen chief Musa escaped with difficulty, but his wife, whom the chroniclers call the queen, was killed, and the valuable jewels that adorned her head were sent by the pope to the emperor Henry. This event led to the conquest of Sardinia by the Pisans, who were urged to it by the pontiff. Benedict went to Germany to urge the emperor Henry to send an army to Italy in 1021 to oppose the Greeks. Henry did so, and obtained several successes, retaking from them Capua and Troja, and other towns of Campania and Apulia. Benedict died in 1024, and was succeeded by his brother, who assumed the name of John XIX.

BENEDICT IX. succeeded John XIX. in 1034. He was a boy at the time of his election, which was obtained through his family interest, and through a lavish expenditure of money on the part of his father Alberico, a powerful baron. Benedict was distinguished by his licentiousness and profligacy, and by the state of anarchy in which Rome was plunged during his pontificate. The Romans at last expelled him in 1044, and chose in his stead John bishop of Sabina, who took the name of Silvester III.; but six months afterwards Benedict returned at the head of a party, drove away his competitor, and excommunicated him. Perceiving however that he was held in detestation by the clergy and the people, he sold his dignity to John Gratianus, who assumed the name of Gregory VI. The emperor Henry III., in order to put an end to these scandals, assembled a council at Sutri, which deposed all the three popes. Baronius says that Gregory VI. voluntarily renounced his claims for the peace of the church, and he places him in the series of legitimate popes. (F. Hardouin, 'History of the Councils.') Henry III. having entered Rome, accompanied by the fathers of the council of Sutri, the latter, in conjunction with the clergy of Rome, elected Suidger, bishop of Bamberg, who took the name of Clement II., and was consecrated at Christmas 1046. But in October 1047 Clement fell suddenly ill and died, and, as some suspected, of poison administered to him by the deposed Benedict, who immediately after forced himself again into the papal see, where he remained till July 1048, when the emperor Henry, at the request of the Romans, sent them Poppo, bishop of Brixen, who, on arriving at Rome, was consecrated, and assumed the name of Damasus II.; but twenty-three days after his consecration he died at Palestrina, upon which the see of Rome remained vacant for more than half a year, until Bruno, bishop of Toul in Lorraine, was elected in 1049, and assumed the name of Leo IX. What became of Benedict afterwards is not clearly ascertained, nor the epoch of his death, but it is generally believed that he died in some convent. Gregory, after being deposed, went into exile to Germany, where he

died in a convent. He was accompanied by the monk Hildebrand, who became afterwards known as Gregory VII.

BENEDICT X (*John*, bishop of Velletri), a native of Capua, was elected by a faction after the death of Stephen IX. in 1058; but Hildebrand, Peter Damianus, bishop of Ostia, and other prelates, supported by the Empress Agnes, assembled a council at Siena, which nominated Gerard, bishop of Florence, who took the name of Nicholas II. Benedict did not submit till the following year, when Nicholas made his entrance into Rome. Panvinius and other writers do not place Benedict among the legitimate popes, but we find him in the chronological tables published in Italy.

BENEDICT XI. (*Nicholas*, cardinal of Ostia) was a Dominican and native of Treviso. He was elected in 1303, after the death of Boniface VIII. He excommunicated those who had laid violent hands upon Boniface at Anagni, but he soon after forgave the Colonna family, and arranged the disputes of his predecessor with Philip the Fair, king of France. He sent Cardinal di Prato to Florence, to act as mediator between the factions which distracted that city. After a pontificate of nine months, Benedict died at Perugia in 1304. The contemporary historians, and Dino Compagni in particular, speak highly of his character and virtues. He was succeeded by Clement V., after an interregnum of nearly eleven months.

BENEDICT XII. (*Jacques Pournier*, a native of France) succeeded John XXII. in 1334. The popes at that time resided at Avignon. Benedict laboured in earnest to reform the abuses and corruptions of the church, which had grown to an alarming extent under his predecessor. He was also inclined to transfer the papal see again to Rome, but was prevented by the policy of the French king, Philip de Valois, supported by the influence of the numerous French cardinals at the papal court. His strictness in enforcing discipline among the monastic orders excited many enemies against him, who endeavoured to cast aspersions upon his character. He died at Avignon in 1342, and was succeeded by Clement VI. Several biographies of Benedict XII. are found in Baluze's 'Lives of the Avignon Popes,' and in Muratori, 'Rer. Ital. Scriptores.'

BENEDICT XIII. (*Cardinal Orsini*, archbishop of Benevento) succeeded Innocent XIII. in 1724. He was simple in his habits and manners, strict in his morality, generous and charitable, and although zealous for maintaining the prerogatives of his see, yet conciliating and unwilling to resort to extremes. Unfortunately he bestowed his confidence upon Cardinal Coscia, a man of some abilities, but covetous and ambitious, and who became hateful to the Romans through his avarice and his abuse of the pope's favour. The people however knew how to distinguish between the favourite and his master. The old dispute about the bull Unigenitus still agitated the Church of France. [**CLEMENT XI.**] Benedict succeeded in reconciling in some measure the dispute by prevailing on the Cardinal de Noailles, archbishop of Paris, to accept the bull; and by issuing another bull, called Pretiosus from its first word, in which he gave an explanation of the former, and an exposition of the doctrine of grace. In this pontificate there were disputes with King John V. of Portugal, with the Tribunal de Monarchia of Sicily, with the King of Sardinia, and with Charles VI.; but Benedict did his best to settle these differences by timely concession and negotiation. He also showed himself anxious for the preservation of peace in Europe: he favoured by means of his nuncios the negotiations of Paris and Soissons in 1727-28, which led afterwards to the treaty of Seville in 1729 between France, Spain, England, and Holland, in which the successions of Tuscany and Parma were finally settled. Benedict increased the pension settled by his predecessors on the Pretender, James Stuart, who had fixed his residence at Bologna. He died at the beginning of 1730, and was succeeded by Clement XII. Benedict XIII.'s works, including sermons written by him before his exaltation, were published at Rome in 3 vols. folio, 1728.

BENEDICT XIV. (*Cardinal Prospero Lambertini* of Bologna) succeeded Clement XII. in August, 1740. He was already favourably known for his extensive learning and for the suavity of his temper and manners. He began his pontificate by finally adjusting the long dispute with the court of Sardinia concerning the nomination to several abbeys and other benefices, besides certain ecclesiastical fiefs in Piedmont, which he gave up to the house of Savoy. He restored likewise the good understanding between Rome and Portugal, and with the kingdom of the Two Sicilies, which had been interrupted under his predecessors. In his intercourse with foreign powers he assumed a tone moderate yet dignified, by which he won general confidence and respect. During the war of the Austrian succession he remained strictly neutral; and although he could not prevent the Spaniards and the Austrians, who were disputing the possession of the kingdom of Naples, from marching through his territories, on which they even fought a battle at Velletri, they stipulated not to enter his capital, and to spare, as far as it lay in the power of the respective commanders, the lives and properties of his subjects. Peace being at length restored to southern Italy, Benedict was enabled to turn his chief attention to the improvement of his own dominions. He encouraged learning, and was generous towards the learned. Rome became again in his time the seat of science and of the arts. The mathematicians Boscovich and Le Maire, the cardinals Valenti, Querini, and Passionei, the philologist Quadrio, the architects Vanvitelli and Polani, and other distinguished men, were employed or encouraged

by this pope. He embellished Rome; repaired churches, among others the splendid one of Santa Maria Maggiore; constructed magnificent fountains, that of Trevi among the rest; built the vast granaries near the Thermae of Diocletian, and dug out the obelisk of the Campus Martius, which was afterwards raised by Pius VI.; founded chairs of physics, chemistry, and mathematics in the university of Rome; added to the collection in the Capitoline Museum; established a school of drawing; enlarged the great hospital of Santa Spirito; established academies for the instruction of the prelates of his court in ecclesiastical history, in the canon law, in the knowledge of the rites and discipline of the church, &c. Nor did he neglect his native town Bologna, to whose Institute of Sciences he contributed by donations.

Benedict instituted at Rome a congregation or board for the purpose of examining the character, morals, and other qualifications of candidates for vacant sees; and he was solicitous for the maintenance of correct morals among his clergy. He found the treasury poor and encumbered, but by reductions and economy he re-established a balance in the finances of the state. During the eighteen years of his reign Rome enjoyed peace, plenty, and prosperity; and half a century after his death the pontificate of Lambertini was still remembered and spoken of at Rome as the last period of unalloyed happiness which the country had enjoyed. His tolerance was remarkable; indeed it exposed him to the censure of the rigorists among the College of Cardinals. Without exhibiting anything like indifference to the doctrines of the church of which he was the head, he showed urbanity and friendliness towards all Christians of whatever denomination, whether kings or ordinary travellers, who visited his capital; and in Germany, France, and Naples his influence was constantly exerted to discourage persecution, and to restrain the abuse of ecclesiastical power. Benedict was learned not only in theology but in history, in the classical writers, and in elegant literature, and he had a taste for the fine arts. His works were published at Rome in 12 vols. 4to. The most remarkable are his treatise, 'De Servorum Dei Beatificatione et Beatorum Canonizatione,' in four books, a work full of historical and theological learning; 'De Synodo Diocesana,' which is also much esteemed; 'Institutiones Ecclesiasticæ;' 'De Misa officio,' libri iii.; besides his 'Bullarium,' or collection of bulls issued by him, and several letters and dissertations in Italian. Benedict XIV. died on the 2nd of May 1758, being over eighty years of age, and was succeeded by Clement XIII.

BENEDICT, SAINT, the founder of the order of Benedictine monks, was born at Nursia in the dukedom of Spoleto in Italy, about the year 480. He was sent to Rome when very young, and there received the first part of his education; when fourteen years of age he removed to Sublaco, a desert place about forty miles distant, where he was concealed in a cavern, his place of retirement for a considerable time being known only to his friend St. Romanus, who is said to have descended to him by a rope, and supplied him daily with provisions. The monks of a neighbouring monastery subsequently chose him for their abbot; their manners however not agreeing with those of Benedict, he returned to his solitude, whither many persons followed him and put themselves under his direction, and in a short time he was enabled to build no fewer than twelve monasteries. About the year 528 he retired to Monte Cassino, where idolatry was still prevalent, and where a temple to Apollo yet existed. Having converted the people of the adjacent country to the true faith, he broke the statue of Apollo, overthrew the altar, and built two oratories on the mountain—one dedicated to St. Martin, the other to St. John. Here St. Benedict also founded a monastery, and instituted the order of his name which in time became so famous and extended all over Europe. It was here too that he composed his 'Regula Monachorum,' which does not however seem to have been confirmed till half a century after his death, when Pope Gregory the Great gave his sanction to it. Benedict died about the year 543, or, according to some authorities, in 547: the day stands in the calendar fixed to March 21. Gregory the Great, in the second 'Book of his Dialogues,' has written a 'Life of St. Benedict,' and has given a long detail of his supposed miracles: Dupin says that the 'Regula Monachorum' is the only genuine work of St. Benedict, but other tracts are ascribed to him.

BENGEL. The writings of few German divines have exercised so much influence upon English Christians as those of Johann Albrecht Bengel. Few have read his works, but many are influenced by their readers. John Wesley states in the preface to his explanatory notes upon the New Testament, which are one of the standards of the Methodist connexion, and to which every Wesleyan Methodist preacher has to declare his assent, "I once designed to write down barely what occurred to my own mind, consulting none but the inspired writers; but no sooner was I acquainted with that great light of the Christian world (lately gone to his reward) Bengelius, than I entirely changed my design, being thoroughly convinced it might be of more service to the cause of religion were I barely to translate his 'Gnomon Novi Testamenti,' than to write many volumes upon it. Many of his excellent notes I have therefore translated; many more I have abridged; omitting that part which was purely critical, and giving the substance of the rest." Dr. Adam Clarke, in his 'Commentary on the Bible,' passes a similar encomium upon Bengel.

Bengel was born on the 24th June 1687, at Winnenden, about fifteen miles from Stuttgart, where his father was a Lutheran clergyman

Bengel's father died of an epidemic, which raged in his native town, in the year 1693. The armies of Louis XIV. invaded the country a few months afterwards, and burned the house which his mother had bought. His father's library was destroyed in the conflagration. From this time Bengel was educated and supported by David Wendel Spindler, a friend of his father's. This gentleman kept a school in the castle at Winnenthal, but was afterwards driven from place to place, until he was appointed, in 1699, one of the masters of the grammar school at Stutgardt. He took Bengel with him wherever he went. At Stutgardt, Bengel made very satisfactory progress in the ancient and modern languages, but would have been deprived of a university education, had it not been for his mother's marriage, after ten years widowhood, with Johann Albrecht Glöckler, who was steward to the convent at Maulbronn. Bengel was received in 1703 into the theological college at Tübingen, and continued there until 1707, when he finished his academical career by a public disputation, 'De theologia mysticâ,' and then became curate in the parish of Metzingen.* In about a year he was recalled as tutor to his college. He himself states his opinion, "That it is very desirable, after having acquired in a country parish a practical turn of mind, to return to college to study divinity afresh." At this time he wrote an essay on the holiness of God, 'Syntagma de Sanctitate Dei.' Soon afterwards he was appointed preceptor of the seminary at Denkendorf, where he read especially the letters of Cicero with his pupils, among whom he maintained a mild but strict discipline. At a later period of his life he became prelate (nearly corresponding to the English bishop) in Würtemberg. Though Bengel was so weakly after his birth, that he received private baptism, nevertheless he reached the age of sixty-five years. He was several times subject to dangerous disorders, especially in the latter part of his life. It became his habit to consider life as a constant tendency to death, and he endeavoured to familiarise himself with the thoughts of death; but he did not agree with those divines who consider the whole of divinity to be nothing more than the art of dying. According to Bengel, the Christian has not so much to wait for death as for the appearance of Jesus Christ, and the most important business for every man is to come from a state of sin into a state of grace, and afterwards not to look for death, but for the Lord. Death had originally no place in the economy of God, and was only introduced afterwards. Bengel did not think highly of the artificial mode of dying, and followed his own ideas on death. He would not die with spiritual pomp, but in a common way, and was employed to the last with his proof-sheets. It was as if he was called out of his room during the hours of work.

Bengel left a numerous family, although six of his twelve children died before him. His great-grandson, J. C. F. Burk, a clergyman in the kingdom of Würtemberg, published in 1831 a 'Memoir of the Life and Writings of Bengel,' an English translation of which, by R. F. Walker, M.A., appeared in 1837, in 8vo.

The literary fame of Bengel has been principally established by his excellent edition of the Greek Testament, which excited the emulation of Wetstein, and facilitated the subsequent researches of Griesbach, Scholz, and Lachmann. His 'Novi Testamenti Græci recte cateque adornandi Prodomus' was printed at Stutgardt, 1723, 8vo, and also at Tübingen, 1734 and 1790; 'Cycclus, sive de anno magno Solis, Lunæ, Stellarum Consideratio,' Ulm, 1745, 8vo; 'Ordo Temporum, a principio per Periodos (Economicis Divinis),' Stutgardt, 1753, 1770, 8vo; 'Tractatus de Sinceritate N. Test. Græce,' Halle, 1763, 4to; 'Apparatus Criticus Novi Testamenti,' Tübingen, 1763, 4to; 'Gnomon Novi Testamenti in quo ex nativa verborum vi simplicitas, profunditas, concinnitas sensuum celestium indicatur,' the best edition was printed at Ulm, 1763, 4to, Tübingen, 1773, 4to. His 'Introduction to the Exposition of the Apocalypse' was translated by J. Robertson, M.D., Lond., 1757, 8vo. This, as well as his 'Reden über die Offenbarung Johannis,' have still their admirers, who see in the events of our days the fulfilment of Bengel's Apocalyptic predictions.

BENGER, MISS ELIZABETH OGILVY, was born at the city of Wells in 1778. She was an only child, and her father, who was a purser in the navy, dying abroad in 1796, her mother was left with very slender means. Miss Benger's early life was consequently passed amidst many privations, one of the greatest of which was her inability to gratify her ardent thirst of knowledge and love of books. In her twelfth year her mother was prevailed upon to let her attend a boys' school for the purpose of studying Latin. At thirteen she wrote a poem entitled 'The Female Geniad,' which was published; and though containing, as might be supposed, many imperfections, it exhibited the dawnings of genius. In 1802, in order to gratify her daughter's earnest wish, Mrs. Benger came to reside in London; and a lady who had previously known Miss Benger, and estimated her as she deserved, introduced her to a circle of friends which included Mrs. Barbauld, Mrs. Joanna Baillie, Mrs. Elizabeth Hamilton, Dr. Aikin, Dr. Gregory, and others. Miss Aikin was amongst the number of her warmest friends; and it is from a short account of Miss Benger's life by this lady that the information contained in the present notice is obtained.

Miss Benger's first literary efforts were directed to the drama, but in this department she did not prove successful, and she soon abandoned it. She next wrote a poem on the 'Abolition of the Slave Trade,' which, with two others, was published in 4to, with engravings. She also published two novels, to which she did not attach her name.

None of the above works can be considered as very perfect compositions. It was as a biographical writer that she obtained her first decided success, and her reputation became fully established by her historical biographies. At the period of her death, which occurred after a short illness, on the 9th of January 1827, Miss Benger was engaged in writing 'Memoirs of Henry IV. of France.' In private life she was sincerely beloved and esteemed for the warmth of her heart and disinterested character.

The following is a list of Miss Benger's biographical works:—1, 'Memoirs of Mrs. Elizabeth Hamilton,' 2 vols. small 8vo. 2, 'Memoirs of John Tobin,' 1 vol. small 8vo. 3, 'Memoirs of Klopstock and his Friends,' prefixed to a translation of their Letters from the German. 4, 'Memoirs of Anne Boleyn,' 2 vols. small 8vo. 5, 'Memoirs of Mary, Queen of Scots,' 2 vols. small 8vo. 6, 'Memoirs of Elizabeth Stuart, Queen of Bohemia,' 2 vols. small 8vo. A complete edition of Miss Benger's historical works has been published in 5 vols. small 8vo.

BENJAMIN of Tudela, a Jewish rabbi, and author of the 'Itinerary,' was the son of Jonas of Tudela, and was born in the kingdom of Navarre. He was the first European traveller who went far eastward. He penetrated from Constantinople through Alexandria in Egypt and through Persia to the frontiers of Tzin, now China. Saxius, who follows Wolfius's 'Bibliotheca Hebraica,' places the date of rabbi Benjamin's travels about 1160. They ended in the year in which he died, A.D. 1173. (Gantz, 'Tsemach David,' fol. 39, quoted by Baratier, 'Diss. I. sur R. Benj.')

The 'Itinerary' of Benjamin is no doubt a curiosity, as the production of a Jew in the 12th century; but considered in itself, it has only a small portion of real worth: for, in addition to the fabulous narrations which lead the reader to suspect him when he speaks the truth, there are many errors, omissions, and mistakes. Benjamin's principal view seems to have been to represent the number and state of his brethren in different parts of the world, and accordingly he merely mentions the names of many places to which we are to suppose he travelled, and makes no remark about them, except perhaps a brief notice of the Jews found there. When he relates anything farther, it is often trifling or erroneous.

Wolfius says, the 'Itinerary' was first printed at Constantinople, in 8vo, 1543; at Ferrara in 1556, and a third edition at Fribourg in 1583. It has been translated from the Hebrew into Latin, Dutch, and French. An English translation, with notes, was published in 8vo, Lond. 1783, by the Rev. B. Gerrans, made from the Hebrew edition published by Constantine L'Empereur at Leyden in 1633.

BENSERADE, ISAAC, a French poet, was born at Lyons-la-forêt in Upper Normandy. He was patronised by Richelieu, introduced at court, and quickly became popular by his sprightly and flattering verses. For twenty years he was employed in composing ballets, which, while Louis XIV. was young and his court brilliant, formed one of the principal diversions of the time. No other poet could so happily give a pleasing turn to the expressions placed in the mouths of his characters, which were a continued series of allusions to personages or events that were immediately recognised by all. Whether Jupiter or Danaë, Apollo or Daphne, all spoke as king, princes, lords, or ladies, distinguished by their beauty or their foibles. Molière protested against the bad taste of such pieces, and composed verses, in which, representing the king as Neptune, he has imitated Benserade's style, and exaggerated his defects. The effort was vain: Benserade retained the court favour, and composed a great variety of pieces of this description. He wrote in addition a number of sonnets, a paraphrase on some chapters of Job; and later in life paraphrases of some of the Psalms. He had then retired to Chantilly, but he returned to Paris to undergo a surgical operation, when the surgeon having severed a vein of which he was unable to stop the bleeding, became frightened and fled; and Benserade died in 1591, aged nearly seventy years according to some authorities; according to others in his eighty-second year.

BENTHAM, JAMES, author of the 'History of the Church of Ely,' was born in the year 1708. He was the fourth son of the Rev. Samuel Bentham, vicar of Witchford near Ely, and was descended from a very ancient family in Yorkshire, which had produced an uninterrupted succession of clergymen from the time of Queen Elizabeth. Having received the rudiments of classical learning in the grammar-school of Ely, he was admitted of Trinity College, Cambridge, in 1727, and took the degree of B.A. in 1730 and M.A. in 1733. His first preferment was the vicarage of Stapleford in Cambridgeshire, in 1733, which he resigned in 1736, on being made a minor canon in the church of Ely. In 1767 he was presented to the vicarage of Wymondham in Norfolk, which he resigned in the year following for the rectory of Feltwell St. Nicholas, in the same county. This he resigned in 1774 for the rectory of Northwold, which he exchanged in 1779 for a prebendal stall at Ely. In 1783 he was presented to the rectory of Bow-brick-hill in Buckinghamshire, by the Rev. Edward Guellaume.

From his first connection with the church of Ely, Mr. Bentham appears to have directed his attention to the study of church architecture, the varieties of which, from the earliest period to the time of the Reformation, were constantly within his view. After above thirty years of diligent research he published 'The History and Antiquities of the Conventual and Cathedral Church of Ely, from the foundation of the Monastery, A.D. 675, to the year 1771,' 4to, Cambridge, 1771. The 'History of the Church of Ely' was reprinted at

Norwich in 4to, 1812, by Mr. William Stevenson; who in 1817 published a 'Supplement' to the first edition in the same size. In 1769, when the dean and chapter of Ely had determined upon the general repair of their church, and the removal of the choir from the lantern to the presbytery at the east end, Mr. Bentham was requested to superintend these operations as clerk of the works. He also contributed to promote works of general utility in his neighbourhood, and rendered great assistance in the plans suggested for the improvement of the fens by draining, and the practicability of increasing the intercourse with the neighbouring counties by means of turnpike-roads, a measure till then unattempted. A letter on the discovery of the bones of the original benefactors to the monastery of Ely, and some Roman coins found near Littleport, printed in the 'Archæologia' of the Society of Antiquaries, vol. ii. p. 364; with one or two pamphlets on local improvements in Cambridgeshire, were Mr. Bentham's other publications. He died at his prebendal house in the college at Ely, on November 17th, 1794, aged eighty-six.

BENTHAM, JEREMY, was born at the residence of his father, Mr. Jeremiah Bentham, an eminent solicitor, adjacent to Aldgate church in London, on the 15th of February 1747-48. At eight years of age he entered Westminster School, and at thirteen he was admitted a member of Queen's College, Oxford, at both which places he is said to have been distinguished. The age at which he entered Oxford belongs more to the practice of former times than that of later years. At sixteen he took his degree of B.A. and at twenty that of M.A. When the time came for attaching his signature to the Thirty-nine Articles of the Church of England, he did so with considerable reluctance, as by that time he felt great scruples of conscience. The mental struggle he experienced, both before and after this event, has been vividly described by himself.

At Oxford, Bentham was one of the class who attended the lectures of Blackstone on English law. His 'Fragment on Government' shows at how early an age he began to feel dissatisfied with the arguments of that writer, and particularly with those based on the 'original contract.' Bentham, whose original opinions were strongly in favour of monarchy, and even of passive obedience, as "stamped with the seal of the Christian virtues of humility and self-denial," felt compelled to inquire where and when this original contract had been recorded. These doubts, he says, led him to the conclusion that "utility was the test and measure of all virtue, of loyalty as much as any."

Bentham's prospects of success at the bar were extremely good, his father's practice and influence as a solicitor being considerable, and his own draughts of bills in equity being distinguished for their superior execution. In one of his pamphlets ('Indications respecting Lord Eldon') he states that, having entered the profession at the desire of his father, he was so discontented with the practice, which he thought amounted almost to a fraud, of taking out unnecessary orders for hearing in order to multiply fees, that he determined to quit it, and rather to endeavour to put an end to, than to profit by, the practice.

In 1776 appeared his first publication, entitled 'A Fragment on Government.' This work, being anonymous, was ascribed to some of the most distinguished men of the day. Dr. Johnson attributed it to Mr. Dunning. In 1780 his 'Introduction to the Principles of Morals and Legislation' was first printed; but it was not published till 1789. He visited Paris in 1785, for the third time, and thence proceeded to Italy. From L'ghorn he sailed for Smyrna, in a vessel, with the master of which he had formed an engagement before leaving England. After a stay of about three weeks at Smyrna, he embarked on board a Turkish vessel for Constantinople, where he remained five or six weeks. From Constantinople Mr. Bentham made his way across Bulgaria, Wallachia, Moldavia, and through a part of Poland, to Krichoff in White Russia. At that place he stayed at his brother's, afterwards Sir Samuel Bentham, at that time lieutenant-colonel commandant of a battalion in the emperor's service, till November 1787, when his brother, who was on an excursion to Kherson, being unexpectedly detained for the defence of the country against the apprehended invasion of the Capitan Pasha, he returned to England through Poland, Germany, and the United Provinces, arriving at Harwich in February 1788.

In 1791 was published his 'Panopticon, or the Inspection House,' a valuable work on prison-discipline, part of which consists of a series of letters, written in 1787, from Krichoff in White Russia, where also he wrote his letters on the usury laws. In 1792 Mr. Bentham presented to Mr. Pitt a proposal on his Panopticon plan of management. It was embraced with enthusiasm by Mr. Pitt; Lord Dundas, home secretary; Mr. Rose, secretary of the treasury; and Mr., afterwards Sir Charles Long, who subsequently became Lord Farnborough. Notwithstanding that enthusiasm, by a cause then unknown, it was made to linger till the close of the session of 1794, when an act passed enabling the treasury to enter into a contract for the purpose. Mr. Pitt and his colleagues gave their authority in support of Mr. Bentham's plan, but years were spent in a struggle between the ministry and some secret influence, and the site of the present Penitentiary, purchased at the price of 12,000*l.* (for the half of which sum the more appropriate land at Battersea Rise might have been had), was erected, at a greater cost, and for a far less number of prisoners, than the one proposed by Mr. Bentham.

The history of such a life as Bentham's is the history of his opinions and his writings, which gave him a higher celebrity abroad than he enjoyed at home. Certain excellent treatises of his were admirably edited in French by his friend and the friend (a remarkable concurrence) of Mirabeau and Romilly, M. Dumont. From these Bentham became well known on the continent; indeed better known than in his native country, and more highly esteemed, as appears from the following incident that occurred during a visit he paid to France in 1825 for the benefit of his health. Happening on one occasion to visit one of the supreme courts, he was recognised on his entrance. The whole body of the advocates rose and paid him the highest marks of respect, and the court invited him to the seat of honour.

From about the year 1817 Mr. Bentham was a bencher of Lincoln's Inn. He died in Queen Square Place, Westminster, where he had resided nearly half a century, on the 6th of June 1832, being in the eighty-fifth year of his age. Up to extreme old age he retained, with much of the intellectual power of the prime of manhood, the simplicity and the freshness of early youth; and even in the last moments of his existence the serenity and cheerfulness of his mind did not desert him.

The leading principle of Bentham's philosophy is, that the end of all human actions and morality is happiness. By happiness Bentham means pleasure and exemption from pain; and the fundamental principle from which he starts is, that the actions of sentient beings are wholly governed by pleasure and pain. He held that happiness is the 'summum bonum,' in fact, the only thing desirable in itself; that all other things are desirable solely as means to that end; that therefore the production of the greatest possible amount of happiness is the only fit object of all human exertion; and consequently of all morals and legislation. In expounding his doctrines, Mr. Bentham has laid them open to the cavils of many disingenuous minds, and prejudiced against them many generous and honest minds, chiefly, as it appears to us, from not having himself sufficiently entered into the metaphysical grounds of them. His system has been branded with the name of 'cold-blooded,' 'calculating,' 'selfish.' It may be shown however that what Bentham termed 'selfish,' would in ordinary language frequently be termed, in the highest and purest degree, disinterested and benevolent.

Dr. Southwood Smith, in his 'Lecture,' has pointed out some of those peculiarities which probably narrowed the sphere of Bentham's usefulness, certainly lowered the degree of his greatness. We allude to the circumstance of his "surrounding himself only with persons whose sympathies were like his own." Bentham secluded himself too much. The greatest political and legislative philosophers in all ages have mingled, at least occasionally, in the business of men, if not testing, at least relieving their abstruser meditations, by the study of man as engaged in action. Those too among them, who have exercised most influence over the minds of mankind, have been content, however far their thinking departed from theirs, in the general, at least to 'speak with the vulgar.' But Bentham, from the time when he embarked in original speculation, not only secluded himself from the general converse of his contemporaries, but occupied himself very little in studying the ideas of others, who like himself had devoted their lives to thinking. The effect of the first was to render his style inaccessible to the mass of his countrymen; of the other to produce what has been aptly termed one-sidedness of mind. His appears, indeed, from all the evidence that we have collected concerning it, to have been an understanding which, though singularly acute and original, had no great facility in apprehending the thoughts of others. Now, such an understanding, though vastly superior to that large class of passive understandings which are able to store themselves with the thoughts of other men, but there stop, is almost necessarily excluded from the first order of great minds, which possess an equal power in mastering the ideas of others, and striking out new ones of their own. Without this power, a man, however original, will waste much of his energy in making discoveries that have been made long before he was born. His theories, too, will be apt to be wanting in comprehensiveness. And this is a fault which no painstaking, which no acuteness ever can remedy.

Bentham appears, from the number of tables scattered through his works, to have been particularly fond of tabularising; and, like many other makers of tables, as well as other things, he does not show, to our apprehension, any extraordinary excellence in this favourite pursuit. He was fond of heaping division upon division in almost endless extent; and very frequently his classes are distinguishable by no logical 'differentia' that we have ever been able to discover; but form that species of division which has received the name of a distinction without a difference.

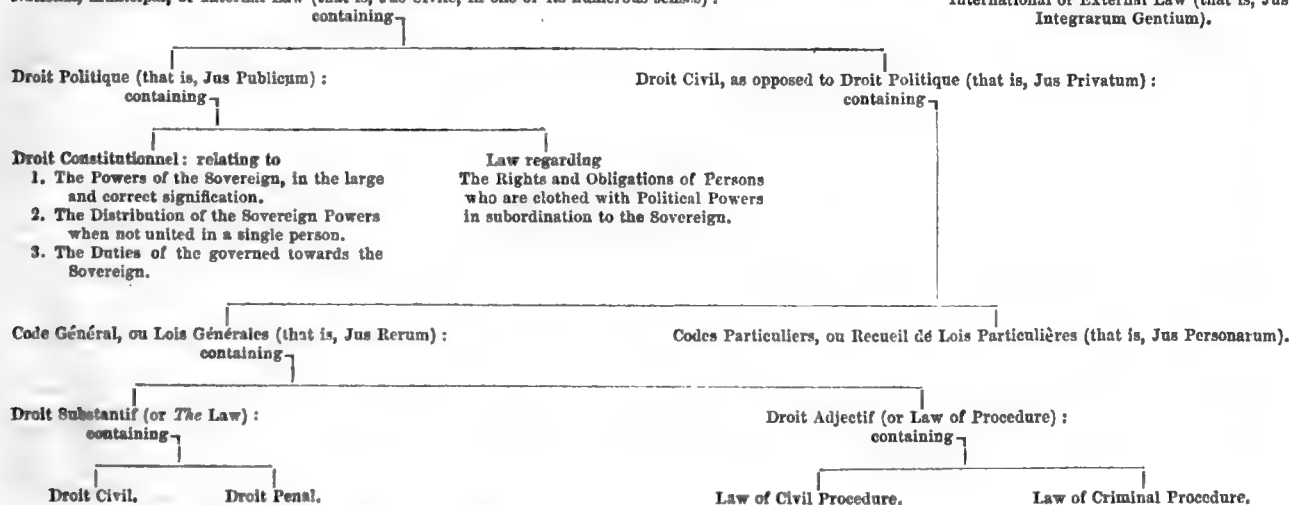

From the general character of Bentham's tabularisation however, we would except the division which seems to have been conceived by him of the field of law. Among some valuable tables which Professor Austin drew up for the use of his class in the London University, was one exhibiting the 'Corpus Juris' ('Corps complet de Droit'), arranged in the order which seems to have been conceived by Mr. Bentham, as expounded in his 'Traité de Législation,' more particularly in the 'Vue générale d'un Corps complet de Droit.' It is particularly worthy of remark that, in the table of which we subjoin

an outline, Bentham, without intending it, has formed a corpus juris very nearly similar to that of the Roman classical jurists.

particularly by exposing the viciousness of the existing language of jurisprudence; and by what he has done towards enforcing the expe-

National, Municipal, or Internal Law (that is, Jus Civile, in one of its numerous senses):

International or External Law (that is, Jus Integrarum Gentium).

Bentham's great merit, and that probably by which his name will be most remembered, was as a philosophical jurist, and writer on legislation. His excellence in this department mainly consisted in substituting rational principles as rules of law in the place of the time-honoured maxims which hardly anyone before his time had dared to dispute. It has been said, indeed, and said truly, that the doctrine of utility, as the foundation of virtue, is as old as the earliest Greek philosophers (see the 'Protagoras' of Plato; also the 'Memorabilia' of Xenophon); and has divided the philosophic world, in every age of philosophy, since their time. But the definitions of natural law, natural justice, and the like, which pervade all the writers on legislation and law from Ulpian down to Montesquieu and Blackstone, show how little progress had been made, previously to Mr. Bentham, in the application of this great principle to the field of law. For his services in this department Bentham deserves, and we doubt not will receive, the admiration and the gratitude of all ages.

It is impossible to know what the philosophy of jurisprudence and legislation owes to Bentham, without knowing what was the condition of it when he began his labours. No system of law then established, least of all that of the country of his birth, exhibited in its construction a comprehensive adaptation of means to ends. The age to which the English law owed its foundations may have produced some works in architecture deserving of admiration, but it has certainly produced no such fabric of law, notwithstanding the loud eulogies of the English lawyers. And that fabric, faulty from its foundations, was rendered still more so by the patch-work manner in which additions were made to it.

The English people had contrived to persuade themselves that the English law, as it was when Mr. Bentham found it, was the perfection of reason. It was a fabric reared by the most powerful and exalted intellects, by wisdom little and only short of divine. To utter a word therefore that might tend to impugn such a system was the height of arrogance and presumption; to raise a hand against it was absolute profanation, nay, the most atrocious sacrilege. Accordingly, when Mr. Bentham commenced his attack, he was at first looked upon as a sort of harmless lunatic. By and by however he began to be regarded in a more serious light—as a madman, who might be dangerous if not put under some restraint. He was assailed from all sides with all sorts of weapons, from the stately contempt of the dignified man of office down to the ridicule and scurrility of the small wits and critics. Nevertheless he did not slacken in the work he had begun, but continued it with unwearied and reiterated efforts.

Mr. Bentham fought this battle for nearly sixty years, and the greater part of that time he fought it alone: for a long time too almost without making a single convert to his opinions. Latterly, M. Dumont gave him considerable assistance by putting his ideas into French. At length his energy and perseverance were rewarded with some degree of success. Some of the leaders of public opinion became convinced, and they in their turn convinced or persuaded others. Mr. Bentham has not been merely a destroyer. Indeed, he considered it a positive duty never to assail what is established without having a clear view of what ought to be substituted. In some most important branches of the science of law, which were in a more wretched state than almost any of the others when he took them in hand, he seems to have left nothing to be sought by future inquirers; we mean the departments of procedure, evidence, and the judicial establishment. He has done almost all that remained to perfect the theory of punishment. It is with regard to the civil code, that he has done least, and left most to be done. Yet even here his services have been very great,

diency of a code, that is, of a complete and systematic body of law. The Law Amendment Society, now containing the most eminent lawyers of the age, have adopted, and are enforcing, many of his views.

One of the excellences of Mr. Bentham's early writings is the ease and elegance, the force and raciness of their style. This remark may surprise those who take their idea of Bentham from the specimens presented by those of his critics, whose object was to depreciate by turning him into ridicule. Certainly, he gave some occasion for this by some peculiarities which he contracted in the latter period of his life; but for the truth of our remarks above, any reader may satisfy himself by referring to Mr. Bentham's earlier works; we would particularise the 'Fragment on Government,' the 'Defence of Usury,' the 'Plan of a Judicial Establishment,' or even the 'Panopticon.' In the style of this work there is a vigour, a freshness, a vivacity, a playfulness, a felicity of expression, that renders the perusal perfectly delightful. Indeed, of these qualities instances abound, even in some of his works that are reckoned most unreadable; for example, in the 'Rationale of Judicial Evidence.' This makes us the more regret Bentham's seclusion, to which we have before alluded, inasmuch as its tendency was to make him less cultivate the above qualities of writing.

Mr. Bentham's principal works are the 'Introduction to the Principles of Morals and Legislation,' the 'Fragment on Government,' the 'Rationale of Judicial Evidence,' in 5 vols., including a very full examination of the procedure of the English courts; the 'Book of Fallacies;' the 'Plan of a Judicial Establishment,' one of his most finished productions, printed in 1792, but never regularly published; his 'Defence of Usury;' 'Panopticon,' an admirable work on prison discipline; 'Constitutional Code,' and many others; besides the treatises so well edited in French by M. Dumont, from the above works and various unpublished manuscripts, which contain all his most important doctrines. A collected edition of his works, in 11 vols., has been recently published by Sir John Bowring, with an introductory volume by J. H. Burton, Esq.

BENTINCK, LORD WILLIAM CHARLES CAVENDISH, was the second surviving son of William Henry, third duke of Portland, and was born September 14, 1774. He entered the army, served in Flanders, Russia, and Egypt, rapidly attained high rank, and as early as 1803 he became governor of Madras. Here he distinguished himself by the advocacy of many useful reforms, but one which he supported though it did not originate with him—that of prescribing or prohibiting various forms for the beards, the moustaches, and the turbans of the sepoys, and the wearing of ear-rings when on duty—led to the violent and dangerous mutiny and massacre of Vellore, in 1805. The consequence of this was Lord W. Bentinck's recall. On his return he filled some slight diplomatic appointments, and afterwards had the command of a brigade in Spain for a short time. In 1810 he went as plenipotentiary and commander-in-chief of the English troops sent to the assistance of Ferdinand, king of Sicily, but gave so little satisfaction to the queen, Caroline (probably from his advocacy of reforms in the government of that island), that in 1811 she repaired to Vienna to court the alliance of Bonaparte. Bentinck took advantage of her absence to induce Sicily to accept the protection of Great Britain, and in 1812 bestowed on the island a liberal constitution, that has proved of small benefit to it, and which has been more than once the cause of civil discord between the king and his subjects. In 1813 he conducted an expedition from Sicily to Catalonia, to operate in the rear of the French armies, but he failed of success, and was forced to

retire precipitately to Sicily. In 1814 he conducted another more successfully in Italy, when Genoa revolted from the French, and was taken possession of by him, although it was subsequently given up to Piedmont, in spite of the opposition of the inhabitants, who claimed (according to the terms of the convention) the establishment of the old republic under the protection of England. Lord William, on this result taking place, indignantly threw up his situation, returned home, and was returned to Parliament for Nottingham. He next became ambassador to Rome, and in 1827, under the ministry of Canning, he was named Governor-General of India. He had been instructed to administer the government on principles of strict economy, and his first step was to reduce the batta, half-batta, &c. (allowances made for marching in the Indian army), greatly to the dissatisfaction of the soldiers. His next step was to abolish flogging among the native troops, as to the effect of which there is much discordant opinion. His next and most important reform—one as to which there is no difference of opinion—was the abolition of the suttee, or the practice of the widow burning herself on the same pile with her dead husband, which was declared illegal December 14, 1829. This of course he could only do in the provinces immediately subject to the British government, and in these the practice had greatly decreased, indeed in some had been discontinued under the restrictive regulations of preceding governors. Another of his reforms, carried in opposition to the government and the company, was the permission for Englishmen to settle in India, though belonging neither to the army nor the civil service. He systematically patronised the native population, and promoted the liberty of the press. In 1834, in consequence of the atrocities committed and the disturbances occasioned to the public peace, he made war on the Rajah of Coorg, and annexed the territory, granting a pension to the deposed rajah, who came in and implored mercy. Shortly after, in 1835, his lordship, finding his health failing, resigned his office, and left Calcutta in March. The native population of Calcutta held a public meeting to express their regret at his departure, and caused an equestrian statue of him to be erected. On his arrival in England, the court of directors also lamented "that the state of his health should have deprived the company of his valuable services." After his return to Europe, he was elected in 1836 member of parliament for Glasgow, for which place he sat until a few days before his death, when he resigned. He died at Paris, June 17, 1839. (*Genl. Mag.*; *Macfarlane, Our Indian Empire.*)

BENTINCK, LORD WILLIAM GEORGE FREDERICK CAVENDISH, commonly known as Lord George Bentinck, was the third son of William Henry, fourth duke of Portland, by Henrietta, daughter and co-heiress of Major-General Scott, whose sister was married to the late George Canning. He was born on February 27, 1802, and though only a younger son, inherited a fortune from his mother that placed him above the necessity of adopting a profession. He however entered the army, and gradually attained the rank of major; but a period of profound peace was not calculated to open the way to any ambitious aspirations in that direction. He therefore, when his uncle Canning became secretary for foreign affairs in 1826, became his private secretary, for which he displayed an extraordinary capacity, was treated with great cordiality, had unbounded confidence reposed in him, and it was thought a brilliant political career was opening before him. In 1827, while his uncle was first lord of the treasury, he entered parliament as member for the borough of King's Lynn, and for that borough he sat till the close of his life. He however did not distinguish himself in parliament at this time, except by a very sedulous attendance: he spoke very seldom, and then not well; but he voted steadily on the side of what were known as moderate Whigs. He voted for Catholic Emancipation, but was not very warm in its favour. On Canning's death in 1827, Lord George gave an independent support (this means opposing them occasionally) to Lord Goderich's cabinet, in which his father was president of the council; but he declined voting in favour of Lord Ebrington's motion that defeated the Wellington cabinet. He however continued to support Lord Grey's government till the secession of Lord Ripon, Sir James Graham, and Lord Stanley (now Earl of Derby), to the latter of whom he was strongly united by the consonance of political opinions and the similarity of pursuits; both being strongly attached to the turf. On the accession of Sir Robert Peel in December 1834, he formed one of the small party nicknamed by O'Connell as the Derby Dilly, "carrying six insiders." He however vehemently denounced the "Litchfield House treaty," by which it was asserted the adhesion of the Irish members was bargained for by the Whigs, and which ultimately led to the resignation of Sir Robert Peel in 1836, and the accession of Viscount Melbourne. From that time until 1841, when Sir Robert Peel again assumed the direction of the government, Lord Bentinck was one of his warmest supporters. On this occasion Sir Robert made him an offer of office, which he declined; but he was most unwearied in his support. It is related that after a late debate, he would travel by rail to Andover to hunt, and return in time to attend the sittings of the house in the evening; throwing a wrapping overcoat of some kind over his scarlet hunting-coat, and exercising indefatigably the office of 'whipper-in' in the house, that is, bringing up the members to a division. But in 1843 the free-trade measures began to alienate many of Sir R. Peel's supporters, and when in 1846 he wholly repealed the Corn Laws, Lord George went into the most violent and personal opposition. Sir R.

Peel resigned, but Lord George abated but little of his animosity, although he opposed the Whig free-traders who had succeeded him. The country party, as it was termed, had been taken by surprise, and knew not where to look for a leader. At length they selected Lord George, who very unwillingly accepted the post, but having accepted it, he threw himself into the part with his accustomed energy in whatever he undertook. He commenced studying statistics, he spoke on every possible occasion, he inspired his adherents with boldness, he impeded the administration in their measures. But though clever, ardent, indefatigable, and too often unscrupulous, free-trade continued its march in spite of his efforts, seconded by those of his principal ally, Mr. B. Disraeli. He had during all these political avocations continued his attention to racing and race-horses, declaring on one occasion that the winning of the Derby was the 'blue-ribbon' of the turf. On the prorogation of the house in August 1848, he retired to Welbeck Abbey for relaxation; he however attended Doncaster races four times in one week, at which a horse of his own breeding won the St. Leger stakes, to his great gratification. On September 21 he left the house on foot soon after four o'clock in the afternoon to visit Lord Mauvers, at Thoresby Park, and sent his servants with a gig to meet him at an appointed place. He appeared not; the servants became alarmed; search was made for him; but it was not till eleven at night that he was found quite dead, lying on a footpath in a meadow about a mile from the house. At the coroner's inquest it was proved that the cause of death had been spasms of the heart. A lengthy life of Lord George has been written by his friend and follower, Mr. B. Disraeli, in 8vo, 1851. (*Gentleman's Magazine*; *Miss Martineau, History of the Thirty Years' Peace*; *B. Disraeli, Life of Lord George Bentinck.*)

BENTIVOGLIO, GIOVANNI, was son of Annibale Bentivoglio, who, after being for some years at the head of the commonwealth of Bologna, was murdered by a rival faction in 1445. Giovanni was then a boy six years of age. In 1462 he was made 'Principe del Senato' of Bologna, and by degrees engrossed the sole authority of the republic. The Melvezi family conspired against him in 1488, but were detected, and cruelly proscribed. About twenty individuals of that family, or its adherents, fell by the hand of the executioner, and the rest were banished. Giovanni showed himself stern and unforgiving, and he hired bravos who executed his mandates in various parts of Italy. At the same time, like his more illustrious contemporary Lorenzo de' Medici, he was the patron of the arts and of learning; he adorned Bologna with fine buildings, and made collections of statues and paintings, and manuscripts. Pope Julius II., having determined to reduce Bologna under the direct dominion of the papal see, marched an army against that city in 1506, and Bentivoglio, after forty-four years' dominion, was obliged to escape with his family into the Milanese territory, where he died two years after, at the age of 70. His two sons were replaced by the French in 1511 at the head of the government of Bologna; but in the next year the French being obliged to leave Italy, Bologna surrendered again to the Pope in June 1512, and the Bentivoglios emigrated to Ferrara, where they settled under the protection of the Duke d'Este.

BENTIVOGLIO, ERCOLE, grandson of Giovanni, was born at Bologna in 1506. He accompanied his father in his emigration to Ferrara, where Duke Alfonso had married his aunt. He was employed by the house of Este in several important missions, during one of which he died at Venice in 1573. Ercole wrote some 'Satires,' which are considered next in merit to those of Ariosto; and several 'Comedies,' which were much applauded at the time: he was also a lyric poet of some celebrity.

BENTIVOGLIO, GUIDO, born at Ferrara in 1579, was a descendant of the Bentivoglios, who had been rulers of Bologna in the preceding century. He studied at Padua, and returned to Ferrara in 1597, when the court of Rome took possession of that duchy, in disregard of the claims of Cesare d'Este, the collateral heir of Alfonso II., the last duke. Ippolito Bentivoglio, Guido's elder brother, had shown himself attached to the Duke Cesare, to whom he was related, and had thereby incurred the displeasure of Cardinal Aldobrandino, the papal legate. Guido contrived to effect a reconciliation between them, and also between Cesare himself, who took the title of Duke of Modena, and Pope Clement VIII. When the pope soon after came to Ferrara he took particular notice of young Guido, and when Guido in 1601 proceeded to Rome he was made a prelate of the papal court. After the death of Clement in 1605, his successor Paul V. sent Guido as nuncio to Flanders, although he was only twenty-six years of age, to endeavour to re-establish concord between the various parties in that long-distracted country, and to bring them again into submission to the papal spiritual authority. It was during his residence in Flanders that he wrote his historical work on the insurrection of that country against the Spaniards in 1568, and the subsequent wars between the Duke of Alba and the other generals of Philip II. and the Hollanders ('*Della Guerra di Fiandra*,' in three parts, 3 vols. 4to, Cologne, 1682-89.) He brings his narrative down to the year 1607. The work is written in the spirit of an advocate of the Church of Rome and of the Spanish authority, but as such displays considerable fairness, and the style is grave and dignified.

In 1616 Bentivoglio was sent nuncio to France, where he won the favour of Louis XIII. and his court by the mildness and courteousness

of his manners, and his prudence and tact in diplomatic affairs. In 1621 he was made a cardinal, and he became afterwards the friend and confidant of Pope Urban VIII. In 1641 Bentivoglio was made Bishop of Terracina. When Urban VIII. died in 1644 it was the general opinion that Bentivoglio would be his successor in the papal chair, which probably he expected himself; but he fell ill and died, at the age of 65, before the cardinals in conclave assembled had time to make their choice. The works of Bentivoglio, besides that mentioned above, are—'Relazioni fatte in tempo delle Nunziature di Fiandra e di Francia,' 4to, Cologne, 1630, in which he describes the manners and character of the nations among whom he lived, and the remarkable incidents of his time: it was translated into English by Henry, earl of Monmouth, folio, London, 1652; 'Memorie con le quali descrive la sua Vita,' 8vo, Amsterdam, 1648, a sort of diary of his life, published after his death; and 'Lettere,' 8vo, Roma, 1654. This last work is held in much estimation for the correctness of the language and fluency and ease of the style, and is therefore often put into the hands of students of Italian.

BENTLEY, RICHARD, born January 27, 1662, was the son of a small farmer or yeoman resident at Oulton, in the parish of Rothwell, near Wakefield in Yorkshire. He was educated at the grammar school of Wakefield, and at St. John's College, Cambridge, of which he was admitted a sizar, May 24, 1676. No fellowship falling vacant to which he was eligible, he accepted the mastership of the grammar school of Spalding in Lincolnshire early in 1682. After holding that office for a year he resigned it to become private tutor to the son of Dr. Stillingfleet, afterwards bishop of Worcester. He accompanied his pupil to Oxford, where he was admitted to the same degree of M.A. as he held at Cambridge. His residence at Oxford contributed to advance both his reputation and learning; he had access to the manuscript treasures of the Bodleian library, and became intimate with several distinguished members of the university, especially Mill, the celebrated editor of the Greek Testament, and Bernard, then Savilian professor. A series of his letters to and from the latter is published in the 'Museum Criticum,' vol. ii., p. 533. At this time he meditated two very laborious undertakings—a complete collection of 'Fragments of the Greek Poets,' and an edition of the three principal Greek lexicographers, Hesychius, Suidas, and the 'Etymologicum Magnum,' to be printed in parallel columns in the same page. Neither scheme however was carried into effect. To the edition of 'Callimachus,' published by Grævius in 1697, Bentley contributed a collection of the fragments of that poet. But his reputation for scholarship was established by a performance of a much more confined nature—a dissertation on an obscure chronicler, named Malala, which was published as an Appendix to Chilmead and Mill's edition of the author in 1691. [MALALA.] This showed such an intimate acquaintance with Greek literature, especially the drama, that it drew the eyes of foreign as well as British scholars upon him, and obtained a warm tribute of admiration from the great critics, Grævius and Spanheim, to this new and brilliant star of British literature.

Bentley was ordained deacon in March 1690. In 1692 having obtained the first nomination to the lectureship newly founded under the will of Mr. Boyle, in defence of religion, natural and revealed [BOYLE, ROBERT], he spared no labour to improve this opportunity of establishing his reputation as a divine. He chose for his subject the confutation of atheism—directing his arguments more especially against the system of Hobbes, while the latter portion of the course was devoted to prove the existence of a Creator, from the evidences of design in the constitution of the universe, as explained by Newton; whose great discoveries, published in the 'Principia,' about six years before, were slowly received by the learned, and continued a sealed book to the world at large. These lectures were received with great applause, and established the author's reputation as a preacher. In October 1692 he was rewarded with a stall at Worcester, and in the following year was appointed keeper of the King's Library. In 1694 he was re-appointed Boyle Lecturer, and followed up his refutation of atheism by a defence of Christianity against the attacks of infidels; but this second series of sermons was never published. In 1696 he took the degree of D.D. at Cambridge; and on this occasion, in his public exercise (or in academical language, his act), he appeared again as a defender of revealed religion.

Bentley's appointment to the office of King's Librarian was the accidental cause of his writing the celebrated 'Dissertation on the Epistles of Phalaris.' The once famous controversy between Boyle and Bentley arose out of an alleged want of courtesy on the part of Bentley relative to the loan of a manuscript from the King's Library to the Hon. C. Boyle, an undergraduate of Christ's Church, Oxford, of promising talents, who had undertaken to edit the 'Epistles' [BOYLE, CHARLES], and who resented the supposed slight in a pettish passage in the Preface (January 1, 1695). On seeing this, Bentley addressed to Boyle a courteous explanation of his conduct, expecting the offensive passage to be cancelled or retracted: but he obtained no satisfaction, and was told he might seek his redress in any method he pleased. Two years elapsed before he took public notice of the insult. Bentley had made up his mind that the 'Epistles' ascribed to Phalaris were spurious, before this quarrel occurred; and in 1697 he was called on by his friend, the learned Wotton, to fulfil a promise he had made, and to state the grounds on which he came to that conclusion.

This he did in an Appendix to the second edition of Wotton's 'Reflections on Ancient and Modern Learning.' At the end of it he notices the unjust charge made against him by Boyle, whose performance he criticises with much asperity. This work created a great sensation, especially among the Christchurch men, who chose to consider it as an insult to the whole society. A knot of the best scholars and wits of the college accordingly united their pens in Boyle's name to punish Bentley, not by fair argument, but by every artifice which wit and malice could devise. Not only his learning, but his character, literary, moral, and personal, were attacked. The joint-work, in which the celebrated Atterbury was the chief performer, appeared in March 1698, and was entitled 'Dr. Bentley's Dissertations on the Epistles of Phalaris and the Fables of Æsop examined,' by the Hon. Charles Boyle, Esq. It obtained such a degree of popularity, as gives some reason for supposing that Bentley had already made himself known and disliked for that presumptuous arrogance which he displayed so remarkably in after-life. It has been so long and so generally acknowledged that in this controversy Bentley was triumphantly victorious, that many may be surprised to hear of the extremely favourable reception which the Oxford rejoinder obtained; the blow was commonly thought fatal to Bentley's reputation as a scholar.

A number of lampoons and attacks of various sorts were made upon him, of which Swift's 'Battle of the Books' is the only one which has obtained celebrity. Bentley was in no hurry to reply to the storm of ridicule and abuse which assailed him on all sides: it was his maxim, he said, that no man was ever written out of reputation, except by himself. He therefore took time to mature his answer, and in the beginning of 1699 published his enlarged 'Dissertations on the Epistles of Phalaris,' which has finally set at rest the question in dispute. This however is the least part of the merits of the work. Professedly controversial, it embodies a mass of accurate information relative to historical facts, antiquities, chronology, and philology, such as we may safely say, has rarely been collected in the same space: and the reader cannot fail to admire the ingenuity with which things apparently trifling, or foreign to the point in question, are made effective in illustrating or proving the author's views. Nothing shows so well how thoroughly digested and familiar was the vast stock of reading which Bentley possessed. The banter and ridicule of his opponents are returned with interest, and the reader is reconciled to what might seem to savour too much of arrogance and the bitterness of controversy, by a sense of the strong provocation given to the author. The Oxford champions expressed their intention to reply, but they probably felt their ground to be cut from under their feet, for they published no answer; nor was Bentley again called into the field by any worthy antagonist.

At the end of the 'Dissertation on Phalaris,' Bentley examines and denies the authenticity of the epistles ascribed to Themistocles, Socrates, Euripides, and others. He also denies the genuineness of the fables which bear Æsop's name (as to their form, entirely, as to their substance, in a great measure), and traces the Æsopian Fables through a number of hands down to the comparatively modern and corrupt prose version now extant. [ÆSOP; BABRIUS.]

On the 1st of February 1700, Bentley, by the gift of the crown, was instituted Master of Trinity College, Cambridge, and resigned his stall at Worcester in consequence of that appointment. In the following year, June 24, he was admitted Archdeacon of Ely. Subsequently he was appointed Chaplain both to William III. and to Queen Anne. In January 1701, he married Joanna, daughter of Sir John Bernard of Brampton, in Huntingdonshire, a lady of amiable temper and cultivated mind, with whom he lived in harmony and happiness throughout their union.

His new situation was admirably suited to meet and gratify the wishes of a scholar; and as a supporter and encourager of literature, Bentley's conduct is deserving of much praise. He took an active part in re-modelling and rendering useful the University press; he gave his countenance and assistance to Kuster, who undertook a new edition of Suidas to be printed at that press; he undertook his edition of Horace, published afterwards in 1711; he wrote his 'Critical Epistles to Kuster' on the 'Plutus' and 'Clouds' of Aristophanes, two of which, written in 1708, are published in the 'Museum Criticum,' vol. ii., 403, &c., together with a 'Letter to Barnes on the Epistles ascribed to Euripides,' dated February 22, 1692-93. A series of emendations, previously unpublished, of the same plays, will be found in the 'Museum Criticum' (vol. ii., p. 126.) He also transmitted in 1708 a long and valuable letter to Hemsterhuis, devoted principally to the correction of the fragments of comic authors in the 10th book of 'Julius Pollux,' of whose 'Onomasticon' that eminent critic had recently published an edition. He made an important improvement in the system of college examinations for fellowships and scholarships, by substituting for the old and loose method of oral examination, that system of written exercises which is still pursued, and which has contributed perhaps as much as any one cause, to the high reputation which the college has long maintained for purity of election as well as for the talents of its members; and he laboured with success for the improvement of the college library. Bentley's conduct in other collegiate affairs was far from praiseworthy. He showed almost from the first a domineering, arbitrary, and selfish, almost a sordid temper, which disgusted the best members of the society, and, in the end,

involved him in a protracted lawsuit, much obloquy, and much unceasiness.

The fellows seem soon to have made up their minds that their new master (who was likely to be less favourably regarded from his being educated not in their own body, but at St. John's) was a grasping arbitrary man; and the bickerings between him and the senior fellows of the college grew frequent. The most objectionable of his acts appears to have been that of intruding fellows into the body, not by the regular and statutable course of election, but by what he termed presumption, by which candidates were chosen to future vacancies; and as the mode was unjustifiable, so his choice of persons to benefit by it was bad. Towards the close of 1709 an open rupture took place between the master and the seniors; and it was followed by a long series of ruinous litigation, by which the college suffered grievously in purse, discipline, and reputation. The seniors appealed against the master to the visitor. Unfortunately a doubt existed whether the Bishop of Ely or the crown was the visitor; and Bentley, supported by a party among the junior fellows, succeeded, by every artifice which legal ingenuity and indomitable pride and obstinacy could suggest, in delaying the decision of this question till 1733, when the House of Lords finally decided that the bishop was visitor. Bishop Greene immediately summoned Bentley to appear before him, and in 1734 pronounced sentence of deprivation against him. But Bentley's obstinacy and fertility of expedients supported him even in this extremity. Availing himself of what appears to have been a blunder in transcribing the statutes, he refused to vacate his office until the vice-master had carried the sentence of the visitor into effect; which, as the vice-master was one of his most devoted followers, was equivalent to annulling the visitor's decision. He thus resisted, for four years, the utmost efforts of his adversaries to procure execution of the sentence, until the death of Bishop Greene, in May 1738, put an end to the suit. We have not attempted to give even an abstract of these proceedings, for an abstract could not well be made intelligible. To those who have leisure for such by-gone points of curious discussion, Dr. Monk's minute account of the whole suit will be full of interesting information.

In 1717 Bentley procured himself to be elected Regius Professor of Divinity. He chose for the subject of his probationary lecture a discussion of the celebrated text 1 St. John, v. 7, on the three Heavenly Witnesses, in which, maintaining the doctrine of the Trinity, he gave a history of the verse, which he decidedly rejected. This work has never been printed, and Dr. Monk has not been able to discover it. Not content with being at variance with the college, he placed himself in the same position with respect to the whole university, in the very first year of office, by an attempt to extort from those persons who were to be created doctors of divinity a larger fee than it had been usual to pay. Like most of Bentley's actions, the claim was prosecuted in a violent and offensive manner, and a warm dispute arose out of this paltry beginning; in the course of which the Master of Trinity and Regius Professor of Divinity, one of the first dignitaries of the university, was, by a grace of the senate, passed by a majority of more than two to one, degraded and deprived of all his degrees, October 17, 1718. Against this sentence Bentley petitioned the king. The matter was referred to the Privy Council, and carried thence into the Court of King's Bench, which, after more than five years of undignified altercation, issued a mandamus, February 7, to the university to restore Richard Bentley to all his degrees, and to every other right and privilege of which they had deprived him.

It shows in a strong light the remarkable activity and energy of Bentley's mind, that these harassing quarrels, which must have occupied a large portion of his time and attention, interfered so little with his critical pursuits. Some of his works, performed during this long period of disturbance, we have already noticed; we have to add a large and valuable body of notes and corrections of Cicero's 'Tusculan Questions,' published in Davis's edition of that work in 1709 ('Richardii Bentleyii Emendationes in Ciceronis Tusculanas'). In 1710 he wrote his 'Emendations' on the comic poets, Menander and Philemon, suggested by Le Clerc's edition of the fragments of those authors. The task was one for which Le Clerc was utterly unfit; and it is said that motives of personal hostility had some influence in inducing Bentley to demonstrate that he was so, which he did with no sparing hand. The work was anonymously printed in Holland ('Emendationes in Menandri et Philemonis Reliquias, ex nupera editione Joannis Clerici; ubi multa Grotii et aliorum, plurima vero Clerici, errata castigantur'), under the signature of Phileleutherus Lipsiensis; but Bentley was universally known to be the author. Under the same name he again appeared in 1713, as a defender of revealed religion ('Remarks on the Discourse of Free-thinking') in his reply to Anthony Collins's 'Defence of Free-thinking.' His answer to the sophistry and fallacies pervading that book was judicious and effective; and for the eminent service done to the church and clergy of England by 'refuting the objections and exposing the ignorance,' to use the words of the University Grace, of the writers calling themselves Free-thinkers, Bentley received the thanks of the University of Cambridge by a vote of the Senate, January 4, 1715. He also did no small service to science, by effecting the publication of a new and improved edition of Newton's 'Principia,' which was intrusted, in 1709, by the venerable author to the management of the eminent mathematician, Roger

Cotes. It appears also from Jurin's preface to his edition of the 'Geography of Varenus' (Cambridge, 1712), that he was induced to undertake that work by Bentley. In 1716 Bentley announced a plan for publishing a new critical edition of the 'Greek Testament,' and explained his views on this subject in a letter to Archbishop Wake, printed in Dr. Monk's 'Life,' chap. xii. For four years he meditated over this design, upon which he spared neither labour nor expense. He made fresh collations of the celebrated Alexandrine and Beza manuscripts, and of other less important manuscripts in England; and he had the assistance of the eminent biblical critic Wetstein and other scholars, in collating manuscripts on the continent. In 1720 he published proposals and a specimen of the intended work, which was to be published by subscription. A large number of subscribers was obtained, but from some unexplained cause, the work was never carried into publication. Many persons ascribed this to the attacks made on the author by Conyers Middleton, the historian of Cicero, a violent and implacable enemy of Bentley. From this opinion Dr. Monk dissents; and it is discountenanced by the well-known hardihood of Bentley's character, and his habitual contempt for all his adversaries.

We have still to go back to notice a work which, perhaps with the exception of the 'Dissertations on Phalaris,' is the most remarkable of Bentley's labours, his edition of Horace, undertaken in 1701, but not completed till 1711. In the progress of this work he involved himself in needless difficulties; for, contrary to the usual practice of scholars, he introduced his emendations (between 700 and 800 in all) into the text, and still more unusually, caused the text to be printed off in 1706, long before the notes were ready. Many of the alterations, it may be supposed, his mature judgment would disallow; for in the preface he expresses his regret for more than twenty of them; and it is probable that he stretched his ingenuity to defend many others which he did not really approve. Many of them have been adopted by the best subsequent editors; but the bulk of them are now rejected as unnecessary, harsh, or prosaic. Nevertheless, Bentley's Horace is a noble monument of the author's learning, critical skill, and acquaintance with the Latin language.

We can do no more than notice, and refer to Dr. Monk's 'Life,' for an account of some of Bentley's minor labours, of which the most important perhaps was an edition of 'Terence,' published in 1726, which deserves notice as being one of the most honourable and unexceptionable of the author's performances. The text professes to be corrected in no less than a thousand places, and the reasons for almost every change are given in the notes. It is especially remarkable for the nicety of care in accentuation, and for the metrical skill which it displays; and contains a valuable dissertation upon the metres of Terence.

In 1731 Bentley, much to the detriment of his reputation, undertook to publish an edition of 'Paradise Lost.' He proceeded on a supposition, first started by Elijah Fenton, that Milton, by his blindness, being obliged to employ an amanuensis, his poem might reasonably be supposed to have been much corrupted, between its delivery from his own lips and its issue from the press. But Bentley pushed the theory beyond all reasonable bounds; for he created an ideal friend, whom he supposed to have filled the office of editor, and to whom he ascribes not only the numerous verbal errors, which he professes to detect, but the introduction of whole lines, and even passages of many verses. In whatever point of view this work is regarded, the editor's presumption is intolerable; and his self-confidence and flippant tone of criticism is equally offensive, especially when directed against a man of genius so different from his own. Bentley does not appear to have had much poetic feeling. His criticisms of Horace have been condemned as prosaic, and his criticisms on Milton display the same fault in a more eminent degree. Nor was he qualified by taste or study to appreciate the store of Italian and romantic learning which Milton in his poem has interwoven with his classical reading. His work—unlike the emendations or restorations made in our own day by a far less skillful and equally prosaic hand in the text of a greater English poet than even Milton—excited almost universal dissatisfaction; resentment on the part of the admirers of Milton; distress and regret on the part of those who wished well to the editor. Nevertheless, like everything else of Bentley's, it displays much critical acumen; and the ingenuity of the commentator might have been admired, if it had been united with a decent share of modesty.

The publication of Bentley's edition of Homer was an important event for the student of the Greek language, since the characteristic feature of it is an attempt to restore the prosody of Homer by the insertion of the long-forgotten Digamma. This was a great undertaking for a man turned of seventy, for he did not begin it till the year 1732, though his opinion relative to the Digamma seems to have been made up several years before. The task was difficult; for even supposing that his views of the lost letter were strictly correct, yet the changes of orthography and language introduced in the course of many ages so complicated the question, that often where the metre was before correct the insertion of the Digamma rendered it unprosodial. Bentley did much, though he was not altogether successful. Payne Knight has more recently renewed the attempt, but, to say the least, without its meeting with the general acceptance of scholars. Bentley's intended work was broken off in 1739, when he had not completed the notes on the sixth book, by a paralytic stroke. Shortly before he had published

his edition of Manilius, which had been prepared for the press no less than forty-five years.

Bentley's literary career ends here. He recovered sufficiently to be able to amuse himself, and the concluding years of his life were spent in the tranquil enjoyment of the society of his family and of a few attached friends. Mrs. Bentley died in 1740, and Bentley survived her little more than two years. He died July 14, 1742, and was interred in the college chapel. His library passed into the hands of his son, Dr. Richard Bentley, a man of learning and talent, but of too desultory habits to obtain eminence in any pursuit. The books were purchased after his death by the house of Lackington, from which they were repurchased by the British Museum, it is said, without any advance of price.

(Monk, *Life of Bentley*.)

BENYOWSKY, MAURITIUS AUGUSTUS, COUNT DE, Magnate of Hungary and of Poland, was born at Werbuena, or Verbowna, the hereditary lordship of his family, in the county of Nitria, in the kingdom of Hungary, at the beginning of the year 1741. He was son of Samuel, count de Benyowsky, a general of cavalry in the Emperor of Austria's service, and of Rosa, baroness of Revay, lady and hereditary countess of Thurock. The young count was educated at Vienna and about the court, and at the early age of fourteen, as the fashion was in those days, he entered the Austrian army. The Seven Years' War was then on the point of breaking out.

In 1756 Benyowsky fought under the celebrated Marshal Braun in the battle of Lowowitz, where the Austrians were defeated by the great Frederic in person. In 1757 he was engaged in the desperate battle of Prague, and in the following year he fought at Schweidnitz and Darmstadt. Though now only sixteen years of age, his courage and decision of character were remarkable.

In the year 1761 he was invited by an uncle, who was a magnate of Poland and starost in Lithuania, to join him in Lithuania. While absent in Lithuania the count's father died, on which his brothers-in-law took possession of all the Hungarian estates, which constituted the main part of his hereditary property. After having in vain summoned them to surrender the land, Benyowsky determined to take the law into his own hands, and do himself right by force. He suddenly appeared in Hungary, and arming the vassals and peasantry on the estates, who were much attached to him, he began to make war on his brothers-in-law, whom he would soon have dispossessed had not the empress and the authorities of the Hungarian diet interfered, and finally obliged him to retire to Lithuania. He repeatedly forwarded memorials to the empress on these affairs, but his appeals were fruitless. It is probable that his rights were not quite so clear to the Austrian government as they seemed to himself. Soon tiring of an inactive life, Benyowsky repaired to the maritime city of Danzig, and made several voyages to Hamburg, and in 1766 sailed from Hamburg to Amsterdam, whence he came to Plymouth. Being in England in 1767, he received letters from certain of the magnates and senators of Poland, engaging him to return and join, in his quality of Polish nobleman, the confederation which was then forming to resist the encroachments of the Russians and the Empress Catherine, who had succeeded three years before in securing the elective crown of Poland to her former lover, Stanislaus Poniatowsky. Count Benyowsky set out for Warsaw, where he arrived in July 1767, and took the oath required by the confederating nobles. As the moment of action had not yet arrived, he employed his leisure in making a journey to Vienna, and once more pressed his right to the Hungarian estates on the Austrian court; but his representations were useless, and he departed for Poland with a determination never again to set his foot in Austria, Hungary, or any part of Maria Theresa's dominions. On his way back, while passing through the county of Zips in Hungary, he fell sick of a fever, and was laid up for several weeks in the house of a gentleman of distinction named Hensky. During his sickness and convalescence Benyowsky made love to one of this gentleman's daughters, whom he married shortly after.

In the beginning of 1768, only two or three months after his marriage, the Polish confederation, known under the name of the Confederation of Barr, took up arms against Russia, on which Benyowsky, without mentioning his intention to his bride, went and joined them in the field, as he was bound to do by the oath he had taken the preceding year. At the opening of the campaign he was appointed general of cavalry. For some time the Polish confederates were everywhere successful, and the Count contributed to most of the victories. But in the unfortunate battle of Szuka, after being dreadfully wounded, he was made prisoner by the Muscovites, who treated him not as a brave and honourable enemy, but as a revolted subject or a brigand. The Russians loaded him with chains, and threw him, with eighty of his comrades, into the dungeon of a fortress, that had no light or air except a little that straggled through a chink which opened upon the casements. From this dreadful confinement Benyowsky was marched with a large body of Polish prisoners to Kiew, and thence to Kazan, in the interior of Russia. While in the latter city, some Russian noblemen, who had organised an extensive conspiracy against the Empress Catherine, seeing the influence he possessed over the minds of the Polish prisoners, who far outnumbered the Muscovite garrison of the place, treated privately with Benyowsky in order to induce him to join in their plots. The count had many interviews with the

conspirators, among whom were many of the Russian clergy, and engaged to join his arms to theirs in case they should be successful in their first rising at Kazan, and should give him and his Poles the necessary weapons, ammunition, and appointments. These facts certainly go far to account for Catherine's implacable enmity towards him, though they neither excuse her brutality, nor, considering the position in which he stood, cast any moral stain on his character. The plot however was betrayed to the governor of Kazan. Benyowsky was accused, but escaped at midnight. A major of the Polish army was the companion of his flight, which Benyowsky managed throughout with wonderful address and talent. Instead of attempting to hide himself in the provinces, he determined to go straight on to the crowded capital, where he fancied he could lie concealed until some foreign vessel should be found to carry him out of Russia. After many curious adventures he reached St. Petersburg, where he hired apartments in a hotel, making his companion, the major, pass himself off as his valet-de-chambre. The system of espionage established by the Empress Catherine was almost perfect, yet Benyowsky was well nigh mocking all its vigilance. He made the acquaintance of a German apothecary, who negotiated a passage for him and his friend with the master of a Dutch vessel then at St. Petersburg. The Dutchman agreed to receive them on board and smuggle them out of the harbour, and as he said he was ready to sail early the following day, he appointed to meet the count and his friend on the bridge of Neva at midnight, and did meet them, as agreed, but only to deliver them into the hands of a party of twenty Russian soldiers. Benyowsky and his friend were carried to the lieutenant-general of police, who, well knowing who they were, subjected them to a long and brutal examination. Eventually however he was given to understand, that by engaging never more to enter her imperial majesty's dominions, and never again to bear arms against her or any of her allies, he should be permitted to leave the country. Having signed a solemn engagement to this effect, he was put into a rude carriage, which set off under a strong escort of Cossaks. At first he was given to understand that he was being carried to Siberia, but he eventually found that his destination was the still more savage country of Kamtchatka. On the 16th of October 1770, the exiles reached Okhotsk, where they embarked to perform the remainder of the journey by water. During the voyage across the ocean the count's exertions and nautical skill saved the ship from wreck. They did not arrive in Kamtchatka until the 2nd of December, and they were no sooner there than Benyowsky, who had conferred with many other exiles during the journey, and obtained some geographical information, resolved to attempt his escape by way of Japan or China. His plans were facilitated by the unsuspecting Russian governor, who engaged him to teach the Latin, French, and German languages in his family. After a number of adventures and narrow chances of failure, having repaired the vessel in which they arrived, and sailed twenty-two bears for sea-stock, on the 11th of May 1771, Benyowsky set sail from Kamtchatka with eighty-five men, who were nearly all exiles, and some few of them people of rank like himself. In the month of September in the same year, the ship arrived at Macao in China. The voyage had been very disastrous; for two months they had suffered hunger and thirst; only sixty-two of those who had embarked were alive, and of the sixty-two only some ten or a dozen could stand upon deck. In China Benyowsky found two ships of the French East India Company, in which he embarked with all his people, having determined to seek employment at the court of France.

During the homeward voyage he spent a fortnight at the island of Madagascar, and this circumstance influenced the rest of his life. In the month of August 1772, he reached France. At the end of the same year the French government engaged him to form an establishment in Madagascar, and on the 14th of February 1774, he arrived in that island, where he soon ingratiated himself with the natives in the neighbourhood of the bay of Anton-Gil, on which he fixed his little colony. He however imprudently engaged with these allies in their wars with some of the other people of Madagascar, and seems to have abandoned his plan of forming merely a commercial settlement for the more ambitious project of making conquests in the island. Certain it is, that M. de Kerguelen, a naval commander, landed the crews of his ships; that a destructive and barbarous warfare was carried on against the blacks of Madagascar; and that almost as soon as the ships withdrew, the blacks drove Benyowsky and his companions from the island, and destroyed his establishment, which had existed for nearly five years.

Disgusted with the French, he quitted their service, and again accepted a command in the Austrian army. But the visions of wealth and absolute freedom and independence in the great African island still pursued him, and on December 25, 1783, he presented proposals to the British government to found a colony in Madagascar on their account. His project was not adopted by the government, but having obtained some co-operation and credit in England, Benyowsky, with his family and a few associates, sailed for Maryland, in the United States, on the 14th of April 1784. At Baltimore he induced a mercantile firm to enter into his views and supply him with a ship of 450 tons burden, well provided with stores and a trading cargo, but furnished also with twenty 6-pounders and twelve swivels. This ship, which was called the 'Intrepid,' sailed from Baltimore for the harbour

of St. Augustine, on the east coast of Madagascar, on the 25th of October 1784. The voyage, from the beginning, was a slow and unlucky one. In the early part of January 1785 the 'Intrepid' made the coast of Brazil, whence Benyowsky wrote the last letter his friends ever received. About a month afterwards the ship ran aground at the island of Juan Gonzalez, and it was not before April that she was got off and made sea-worthy. Benyowsky then stood across the Southern Atlantic for the African continent. He doubled the Cape of Good Hope, without putting into port there, and after touching and resting for a short time at Sofala, he at last (on the 7th of July 1785) cast anchor at Madagascar, in the Bay of Antangara, 10 leagues to the south-west of the Bay of St. Augustine. It is then stated that Lamboin, king of Northern Madagascar, whom he had known on his former visit, came to pay his respects, and that a body of the race, or tribe, called Seclaves, under their chief or king, came also and encamped near to Benyowsky; that the count proposed to enter into the solemn compact or oath of blood with the Seclaves, and that their chief declined on the pretext of being much fatigued by his journey. According to the protest of the master of the American ship, it should seem that Benyowsky met his death at the hands of the savages on the 1st of August, but as the contrary is known beyond a doubt, entire discredit is thrown on the ship-master's evidence. The American master certainly abandoned him, sailed away, and sold the ship and cargo at Oibo.

But though thus abandoned, the resources of this extraordinary man did not fail him. He put himself at the head of an armed force of the natives, and seized the magazines and warehouses of the French, who, to the annoyance of the Madagascar savages, had formed more than one establishment on the island. In consequence of these and other hostilities, the governor of the Isle of France sent a ship to Madagascar with sixty French soldiers, who landed and attacked the count on the morning of the 23rd of May 1786. Benyowsky awaited their approach in a small redoubt he had thrown up. The blacks fled at the first fire of the French, and the count having received a ball in his right breast, fell behind the parapet, and expired a few minutes after, in the forty-fifth year of his age.

(*Memoirs and Travels of M. A. Count de Benyowsky, written by himself.*)

* BÉRANGER, PIERRE JEAN DE, was born in Paris August 19, 1780, of humble parentage, and in his earliest years was brought up by his grandfather, a tailor. He witnessed the taking of the Bastille in 1789, and was then removed to the care of an aunt, who kept an inn at Peronne. Here he first learnt to read. At fourteen he was apprenticed to a printer in Peronne. Somewhat later he attended a primary school founded at the same place. At sixteen he returned to his father at Paris, and having attended some theatrical representations, he resolved to attempt a comedy, and produced 'Les Hermaphrodites.' At eighteen he projected the writing of an epic, to be called 'Clovis;' this he proposed as the task of the succeeding twelve years. He also produced verses on sacred subjects, some of which have been given in the edition of his works edited by M. Perrotin, and published in 1834. These performances did not improve his fortunes; and, reduced to great distress, he thought of proceeding to Egypt, where Bonaparte then was, and whose first successes had excited extravagant visions of glory and prosperity among the French population. The return however of some members of the expedition dissipated Béranger's dream, and he remained in Paris. It was at this period, when suffering from his disappointed hopes, and even actual indigence, that he seems to have resolved to be gay if he could not be happy, and he produced his 'Roger Boncompagni,' 'Le Grenier,' 'Les Gueux,' and 'Le Vieil Habit.' They were not immediately successful; but in 1803 he sent some of his poems to Lucien Bonaparte, who promised to ameliorate his situation. Lucien was suddenly called to Rome. Béranger thought himself forgotten; when a letter came from Lucien, assigning to Béranger his income as a member of the Institute. He next obtained some employment as an editor, and in 1809 was appointed a clerk in the secretary's department of the Academy. His songs were now becoming popular in every quarter. During the 'hundred days' of Bonaparte, Béranger refused the lucrative office of censor. In 1815, when he published his first collection of songs, which were popular throughout France, he was informed that it would occasion his dismission from the office he held in the Academy. He wavered not, and was retained; but in 1821, when the second collection was published, he was at once discharged. He wrote more and more poignant satires upon the government; he was prosecuted, and sentenced to three months' imprisonment and a fine of 500 francs. In 1828 he published his third collection. For this he was again prosecuted, and was condemned to nine months' imprisonment and a fine of 10,000 francs. Confined more strictly in the prison of La Force, the undaunted poet continued his attacks on the faults and follies of the government, and these remarkable lyrics aided not a little in accelerating the fall of the Bourbons.

In 1830 the revolution of July would have acted favourably on Béranger's fortunes if he would have given up his beloved independence. He says, "I was treated with as one of the great powers;" "nearly all my friends have become ministers;" "unfortunately I have no love of sinecures, and all compulsory labour has become insupportable." Béranger was convinced that France was not fitted at this time for a republican government, and he supported the establishment of a limited monarchy. In 1833 he published his fifth and last collection

of songs, containing some of his most striking pieces. After the revolution he was elected in April a representative of the department of the Seine in the constituent assembly, by more than 200,000 votes; but in May he sent in his resignation. It was unanimously refused, but a week afterwards he renewed it, and it was accepted.

Béranger continues to write, but does not publish. He is known to have a large collection of songs, and he employs himself also with a 'Biographie des Contemporains.'

The songs of Béranger have deservedly attained a high reputation, not only in France but throughout Europe. One charm is their complete nationality. The delicate wit, the subtle satire, the indignant denunciation, the vivid and correct pictures, the frequent comicality of situation—are all truly and exclusively French; and so are the faults that are sprinkled rather too frequently through them. His command of language is marvellous, and in the most difficult rhythms the words always seem to drop naturally into their places; but this is understood to be attained by him only with great labour.

The whole career of Béranger is very remarkable. He had become a real power in the state under the first Napoleon. Although he felt that there was no hope for the national freedom of his country while that despotism endured, he had a sincere admiration of the emperor's genius. Consequently there were no personal attacks in his early songs; and when a little gentle raillery upon externals was ventured—as in 'Le Roi d'Yvetot' and 'Le Sénateur'—it was laughed at and applauded even at court. Béranger is considered by his countrymen as a religious poet: this is not the impression which an Englishman would receive. But he certainly does not shock by impiety, however he may offend by levity and want of reverence. The songs for which he was prosecuted were not attacks on religion, but on its false assumption. Fined and imprisoned under the Bourbons, he still remained the conqueror. Béranger has little resemblance to our own song-writers. He has none of the deep passionate love depicted by Burns. He never contemplates the happiness of

"Loving and being loved by one;"

but—

"Takes, forsakes, retakes Lisette"

in a fashion that jars on English feelings of delicacy. The passion he describes indeed is rather that which has become appropriated in English to the French word "amour." His contrast to our patriotic singer, Dibdin, is also striking. Dibdin holds out few incentives to the sailors he addressed beyond a sense of duty, prize-money, a picture of domestic happiness with their Nancy, and Greenwich Hospital. Such encouragements find no place with Béranger. The glory of France is the most prominent inducement to fight and to die. To our other lyrical poet, Moore, he has somewhat more resemblance.

(*Nouvelle Biographie Universelle.*)

BERCHTOLD, LEOPOLD, COUNT, a native of Germany, born in 1758, is celebrated for his philanthropic exertions, having spent thirteen years in travelling throughout Europe, and four years in Asia and Africa, with a view of mitigating human sufferings, to which object indeed the whole of his life was devoted. In 1797 he published at Vienna directions for the cure and prevention of the plague, having travelled two years throughout Asiatic and European Turkey for the purpose of investigating its symptoms and determining its character. The Royal Academy of Sciences at Lisbon ordered these directions to be translated into Arabic, French, and Portuguese. Count Berchtold attempted to effect reforms in the state of European police, and wrote some pamphlets on the subject, which were printed and distributed by him gratuitously in different countries. Some of his plans he laid before the French National Assembly, and he submitted to that body observations on the necessity of making swimming and diving a branch of national education. Possessed of an ample fortune, he offered prizes for essays on various subjects connected with his philanthropic plans: among others, one of a thousand florins for the best treatise on Benevolent Institutions; and not content with this, he was also the founder of several such establishments. He was also active in making known the advantages of vaccination. During a famine in Germany in 1805-06, he procured for the poor supplies of food from districts in which famine did not prevail; and in the course of the revolutionary war he converted the palace of Buchlowitz, on his estate in Moravia, into an hospital for the sick and wounded. At this place he died, July 26, 1809, of a contagious nervous fever.

The results of the experience and observations of Count Berchtold, as a traveller, will be found in the following work, which was dedicated to Arthur Young, and published in London in 2 vols. 12mo:—'An Essay to direct and extend the Inquiries of patriotic Travellers; with further Observations on the means of preserving the Life, Health, and Property of the inexperienced in their Journeys by Sea and Land; also a series of Questions interesting to Society and Humanity, necessary to be proposed for solution to men of all ranks and employments, and of all nations and governments, composing the most serious points relative to the objects of all Travels.'

BERENGER, one of the most learned divines of the 11th century, was a native of Tours. He was made treasurer of the church of St. Martin in that city, and afterwards became archdeacon of Angers. Berenger, Lanfranc, and Anselm, were the restorers of logic and metaphysical studies in Europe, with the assistance of Aristotle's works,

which were about that time imported into France from the Arabian schools of Spain. Berenger was one of the first who employed logical reasoning in the study of the Scriptures, which had till then been interpreted according to tradition and the authority of the fathers. They were, if not the founders, at least the promulgators of the scholastic theology which became so common in the schools during the middle ages. Berenger maintained the doctrine of Scotus, that "the bread and wine used in the sacrament of the Eucharist were not transformed into the body and blood of Christ, but preserved their natural and essential qualities, and were only to be considered as external symbols of the body and blood of the Saviour." Pope Leo IX. procured the condemnation of Berenger's doctrine by the councils of Rome and Vercelli, 1049-50, and the book of Scotus was also committed to the flames. Henri I. of France assembled a council at Paris for the same purpose, when Berenger was again condemned and threatened with temporal punishment. Pope Victor II. summoned a council at Tours in 1054, at which the monk Hildebrand, afterwards Gregory VII., appeared as the pope's legate. Berenger was induced by denunciations and threats to retract his doctrines concerning the Eucharist and to make his peace with the church. We find him soon after again maintaining his former tenets, upon which Nicholas II. summoned him to Rome in 1058, and the council assembled in that city in the following year drew up a confession of faith on the subject of the Eucharist, stating "that the bread and wine after the priest's consecration were not only a sacrament, but the real body and blood of Christ, and consumed as such by the faithful." Berenger signed this confession, but soon after returning to France abjured it again publicly. At last, Hildebrand, who professed a high esteem for Berenger, having become Pope under the title of Gregory VII., summoned him to Rome in 1078, when another council was held, before which Berenger drew up a new confession of his doctrine, in which he professed to believe that the bread and wine after consecration became the true body and blood of Christ. Berenger's enemies, not thinking this declaration sufficiently explicit, another council was held in 1079, and Berenger was induced to declare that bread and wine were, by the mysterious influence of the words of the Redeemer, "substantially changed into the true, proper, and vivifying body and blood of Christ, not only in the qualities of external signs and sacramental representations, but in their essential properties and in substantial reality." This is the famous doctrine of transubstantiation; Berenger, in his confession of the year before, seems to have attested only his belief of the real presence. Such is the opinion of Mabillon and of some other theologians, both Catholic and Lutheran, concerning Berenger's doctrine.

After the last declaration of Berenger, Gregory VII. showed him great kindness and esteem, and allowed him to return to France; but Berenger once more retracted this his declaration of 1079. Gregory VII. took no further notice of the dispute, nor of Berenger's retraction. Gregory seems to have been for adhering to the words of the Scriptures, "Hoc est corpus meum" (Matt. xxvi. 26), and not inquiring further into the nature of the mysterious presence.

Berenger, fatigued and grieved with this long controversy, retired to St. Cosme, near Tours, where he spent the last years of his life in religious and ascetic exercises until 1088, when he died.

(Lanfranc's works; Berenger's letters in the *Thesaurus Anecdotorum*; Lessing, *Berengarius Turonensis*, Brunswick, 1770.)

BERENICE (1), one of the four wives of Ptolemæus I., the founder of the dynasty of the Lagidæ in Egypt, and the mother of Ptolemæus II., called Philadelphus. Berenice had a son, Magas, by a former husband, who was afterwards king of Cyrene.

Copper. British Museum. Weight 308 grains.

The head on the above coin is said to be that of Berenice, the wife of the first Ptolemæus: the inscription on the other side is 'King Ptolemæus.'

BERENICE (2), a daughter of Ptolemæus Philadelphus by Arsinoë the daughter of Lysimachus. She was the sister of Ptolemæus III., Euergetes, and was given in marriage B.C. 252 by her father to Antiochus II., king of Syria, called Theus or God, who divorced his wife Laodice on the occasion. After the death of Philadelphus, Antiochus divorced Berenice and took back Laodice, who poisoned her husband and put Berenice to death together with a son whom she had by Antiochus. To avenge his sister's death, Ptolemæus III., Euergetes, invaded Syria, put to death Laodice, and overran the empire of the Seleucidæ. [PTOLEMÆUS.]

BERENICE (3), the wife (about B.C. 248) of Ptolemæus III.,

Euergetes; but her parentage is doubtful. She was the daughter of Magas, who was king of Cyrene and half-brother of Ptolemæus Philadelphus on the mother's side.

This Berenice is said to have made a vow of her hair during her husband's wars in Asia. Conformably to the vow, the hair was placed in the temple of Venus, from which it was stolen, but Conon of Samos declared that it had been taken up to the skies and placed among the seven stars in the lion's tail. Callimachus wrote a poem on the occasion which is now only known from the beautiful translation by Catullus—'De Coma Berenice.' The name of Berenice occurs in the fifth line of the Greek part of the Rosetta inscription, now in the British Museum, with the feminine form of her husband's appellation, Euergetes, 'the benefactress.' Berenice was put to death by her son Ptolemæus IV., Philopator, and his infamous minister Sosibius.

BERENICE (4), otherwise called Cleopatra, the only legitimate child of Ptolemæus VIII. (Soter II.), reigned six months, the last nineteen days of them in concert with her husband Alexander II., who, according to Appian and Porphyry, murdered her nineteen days after the marriage, B.C. 81. It appears from Appian that Sulla determined that this Alexander, who had long been an exile from Egypt, should return and share the sovereign power with Berenice.

This coin may probably belong to this Berenice; the inscription is 'Queen Berenice.' Mionet assigns it to Berenice (3). The portraits of Alexander II. and this Berenice appear frequently on the great wall of sandstone which incloses the temple of Edfu, and the portrait of Berenice is always the same. See Rosellini, plate xxii., figs. 80, 81; and xxiii. 29, which is a full-length portrait of Berenice. Figs. 80, 81, represent respectively the heads of Alexander and Berenice, which are distinguished by the handsome features that appear to have characterised the descendants of the first Ptolemæus. It would seem that the great sculptures of the inclosure wall of Edfu, which cover it on both sides, were executed in the joint reigns of Alexander II. and Berenice, from which fact Rosellini infers that a longer period must be assigned to their joint reign than the nineteen days given by the chronologers. The Athenians made a bronze statue of this Berenice. (Pausan. i. 9.)

BERENICE (5), a daughter of Ptolemæus IX., Auletes, who began to reign in Egypt B.C. 81, and sister of the celebrated Cleopatra. During the absence of her father at Rome Berenice was made regent, which office she held from about B.C. 58 to B.C. 55. Gabinius, about the close of B.C. 55, came to Egypt with an army and restored Auletes, who put his daughter to death. Berenice first married Seleucus, the pretended son of Antiochus Eusebes, a feeble man, whom, it is said, she caused to be strangled; and afterwards Archelaus, who was also put to death on the restoration of Auletes.

BERENICE (6), a daughter of Herodes Agrippa I., the grandson of Herod the Great. (Acts xii.; Matthew ii.) She was the sister of Herodes Agrippa II., before whom Paul preached A.D. 63 (Acts xxv. 13), and the wife of Herodes of Chalcis, who seems to have been her uncle, and left her a young widow. Titus, the son of Vespasian, fell in love with Berenice, who had taken an active part at the time when Syria declared in favour of Vespasian against Vitellius. (Tacit. 'Hist.')

Berenice was then a young and handsome woman. After the capture of Jerusalem she came to Rome (A.D. 75), and Titus is said to have been so much attached to her that he promised to marry her; but on the death of his father he sent Berenice from Rome, much against his will and hers, when he found that the proposed match was disagreeable to the people. Racine has written a tragedy on the subject of Titus and Berenice.

BERESFORD, WILLIAM CARR, VISCOUNT, the natural son of the first Marquis of Waterford, was born on October 2, 1768. He entered the army early, and while serving in Nova Scotia lost the sight of an eye from the accidental shot of a brother officer in 1786. He served at Toulon, at Bastia, at Calvi, and in the West Indies under Abercromby, and in Egypt under Baird. In 1806, having attained the rank of brigadier-general, he commanded the land forces in the expedition against Buenos Ayres, and was taken prisoner, together with his corps, but he contrived to escape shortly afterwards. In 1807 he commanded the force which obtained possession of Madeira. In 1808 he arrived in Portugal with the English forces, and to him was confided the organisation of the Portuguese army, including the militia. This he effected so completely, that the Portuguese troops, throughout the Peninsular war, showed themselves worthy of fighting by the side of their British allies. On May 4, 1811, he invested the fortress at Badajoz, and on the 16th defeated Soult at Albuera. At the battle of Salamanca, in 1812, he was wounded. He then commanded a division under Wellington, and took a distinguished share in the battles of Vittoria and Bayonne. On the 10th of April 1814 he attacked and carried the heights before Toulouse with great skill and bravery. For his services he had been created a Portuguese field-marshal, Duke of Elvas, and Marquis of Santo Campo; and he was now created a British peer by the title of Baron Beresford. In the same year (1814) he was sent on a mission to Brazil: he returned in 1815, and after a short visit to Portugal he repaired to Brazil again. On his return he resumed the command of the army of Portugal, at the request of the Portuguese government, but resigned it at the end of a few years, not approving of the efforts there being

made to establish a constitutional government. On his return to England in 1823 he was created Viscount Beresford. From 1823 to 1830 he was master-general of the ordnance. He continued to take an active part in politics, being strongly attached to the Tory party; and in 1826, in consequence of assisting in forwarding English troops for the support of Don Miguel, he was deprived of his rank as Portuguese field-marshal. In 1832 he had married Louisa, his cousin, the daughter of the archbishop of Tuam, and the wealthy widow of Thomas Hope the banker, but left no issue. He died at Bedgebury Park, Kent, on January 8, 1854. At the time of his death he was governor of the Royal Military Academy at Woolwich, and governor of the island of Jersey. (*Gentleman's Magazine; Pictorial History of England.*)

BERGHAUS, HEINRICH, was born on May 3, 1797, at Cleves, in Rhenish Prussia. After studying at Münster, Marburg, and Berlin, when only fourteen years old, and acting in the royal corps for the management of highways and bridges, he found frequent opportunities of increasing and displaying his geodesical knowledge. In 1815 he accompanied the German army under General Tauenzin, as a volunteer, into France as far as Brittany. Of this opportunity he availed himself so sedulously, that in 1824 he published an oro-hydrographic map of France, which is justly allowed to be the most perfect hitherto compiled. After his return he occupied himself partly by map constructing at Weimar, partly by surveying and measuring the heights in Franconia and Thuringia, of which the results have been since made public. In 1816 he received an appointment as geographical engineer in the war department at Berlin, and from this time till 1821 he was occupied with the great trigonometrical survey of the Prussian kingdom. He also took part in several important undertakings, as in Weiland's Map of the Netherlands and Reyman's Map of Germany. In 1824 he was appointed professor in the Berlin Academy, and received permission to reside at Potsdam. Berghaus's industry and productiveness is extraordinary. He has produced, among many others, a Map of Africa, in 18 sheets; a most precise map of Asia, in 60 sheets; a Physical Atlas, of which he was one of the first to give an example; a collection of hydro-physical sheets for the use of the Prussian marines. As an author also he is equally fertile; in union with Hoffmann he issued the 'Hertha,' a collection of valuable geographical essays, from 1825 to 1829; 'Universal Geography,' in several volumes, and 'Principles of Geography,' in five books. (*Conversations-Lexikon.*)

BERGHEM, NICHOLAS, whose family name was Van Haerlem, was born at Haerlem in 1624. He received his first instructions from his father, a painter of still life, of no remarkable talent. Afterwards he became the pupil successively of Van Goyen, Jan Wils, and Weenix. During his early practice he frequently painted sea-ports and shipping, and his works of that period bear a strong resemblance to those of Weenix; but subsequently he devoted himself almost exclusively to landscape. The works of Berghem evince great liveliness of fancy, a judicious taste in selection, and a mastery in pencilling which has not often been equalled. His landscapes are usually enriched with architectural ruins and picturesque groups of figures and cattle; and these compositions, although evidently made up of materials selected at different times and from various sources, have such an air of truth, that it is difficult to believe they were not copied directly from nature. Berghem had an executive power which never missed its aim; his touch is equally free and discriminating, whether expressing the breadth and richness of masses of foliage, the lightness and buoyancy of clouds, the solidity of rocks and buildings, or the transparency of water; his distances are graduated, both in relation to lines and tints, with admirable truth of perspective; and he frequently gave great grandeur to his effects by broad masses of shadow, whose negative quality he perfectly understood and expressed. He painted with extraordinary dispatch, but his works betray no traces of negligence; his finishing stops at the point which unites accuracy with freedom.

Berghem was indefatigable in the practice of his art, usually painting, even during the summer months, from sunrise till sunset; yet such was his reputation that he found it difficult, even by this unwearied diligence, to satisfy the demand for his pictures. He died in 1683, aged fifty-nine. Descamps, in his lives of the Flemish painters, gives a long list of Berghem's pictures; there is a prodigious number of them in Holland, and they are frequent in English collections. Some fine specimens are in her Majesty's collection and at Dulwich College, but there is no specimen in the National Gallery. Many of his works have been finely engraved by Vischer.

Berghem's own etchings and drawings were exceedingly beautiful, and are eagerly sought after. A descriptive catalogue of them was published by Henry de Winter at Amsterdam in 1767.

BERGLER, JOSEPH, a distinguished historical painter, born at Kalzburg in 1753. He was instructed by his father, and gave such early evidence of talent, that he was sent in 1776 to complete his studies in Italy, by the prince-bishop Cardinal Firmian of Passau. In Italy he studied oil and fresco five years with Martin Knoller at Milan; in Rome, where he remained altogether six years, he was acquainted with Mengs, Canova, and Gavin Hamilton; and Camuccini, Tischbein, and Volpato were his contemporary students there. During this period however he visited Parma, and obtained the great

prize of the Academy in 1784 for a picture of Samson delivered by Delilah to the Philistines. He returned to Germany and settled in Passau in 1786, when he was appointed painter to the prince-bishop Cardinal Auersperg. During his stay at Passau until 1800, he painted several excellent altar-pieces for the churches of neighbouring towns. In 1800 Bergler was made director of the Academy of Prague, and his ability and activity combined enabled him to educate several very able scholars, who adorned the Bohemian capital with their works; and he himself furnished altar-pieces for many of the churches of Prague and its vicinity: one of his principal works at this time was a large picture of Hermann and Thunelda, from Klopstock's 'Hermannschlacht.' He died at Prague in 1829. He had great facility of execution, but his chief excellence consisted in a general effective style and composition of colour. He has also etched many of his own designs with great ability. (*Dlabacz, Künstler-Lexicon für Böhmen; Nagler, Neues Allgemeines Künstler-Lexicon; Göthe, Winckelmann und sein Jahrhundert.*)

BERGMAN, TORBERN OLOF, a distinguished chemist, was born on the 9th of March 1735, at Catherinberg in West Gothland, of which district his father, Berthold Bergman, was receiver of the revenues. After acquiring at school some knowledge of languages, botany, and natural history, he was sent at seventeen years of age to the university of Upsala, and was intended by his father for the church or the bar. He soon however manifested his dislike for both these professions, and after some opposition he was permitted to pursue the studies for which he had a decided preference, and he eventually devoted his time to mathematics, physics, and natural history.

He paid very considerable attention to botany, and especially to grasses and mosses; he studied entomology with success, and having collected several insects previously unknown in Sweden, and some even quite new, he sent specimens of them to Linnæus at Upsala, who was much gratified with the present. The first paper which he wrote, and which was printed in the Memoirs of the academy of Stockholm for 1756, contained a discovery of considerable importance. In some ponds not far from Upsala a substance was observed, to which the name of *Coccus Aquaticus* was given, but its nature was unknown; Linnæus conjectured that it might be the ovarium of some insect. Bergman ascertained that it was the ovum of a species of leech, and that it contained from ten to twelve young animals.

Although mathematics and natural history occupied the greater part of his time, he continued to prosecute the study of natural history as an amusement. In 1758 he took his Master's degree, taking 'Astronomical Interpolation' for the subject of his thesis; and soon after he was appointed Magister Docens in the university of Upsala, and while in this situation he wrote several ingenious papers on the aurora borealis, the rainbow, twilight, &c. In 1761 he was appointed Adjunct in mathematics and physics, and his name is among the astronomical observers of the first transit of Venus over the sun in 1761, whose results deserve the greatest confidence: he also made some important observations on the electricity of the tourmaline.

In 1767 Wallerius resigned the professorship of chemistry in the university of Upsala. Bergman immediately offered himself as a candidate, and to prove his fitness for the place, he published two dissertations on the manufacture of alum; and ultimately succeeded. After his appointment he was assiduously occupied with the duties of his office, and he frequently published dissertations on important branches of chemistry. In 1776 Frederick of Prussia endeavoured to prevail upon him to become a member of the Berlin Academy of Sciences and to settle at Berlin. The offer was highly advantageous, but the king of Sweden, who had been his benefactor, was unwilling to part with him; on this occasion he was knighted and received a pension of 150 rix-dollars. The health of Bergman appears always to have been delicate, and it was permanently injured by his intense application to study when he first went to Upsala; in summer he occasionally repaired to the waters of Medevi, a mineral spring which is celebrated in Sweden, and there, on the 8th of July 1784, he died.

It is impossible to give an account of all the writings of Bergman, for they amount to 106; they are all collected into six octavo volumes, entitled 'Opuscula Torberni Bergman Physica et Chemica,' excepting a few of the less important.

The first chemical memoir which he published was 'On the Aërial Acid,' and printed in 1774; he shows that this gaseous body, now called carbonic acid, possesses acid properties, and is capable of combining with bases and forming salts with them. It is to be observed that he makes no mention of the previous labours of Dr. Black on this subject. In 1778 appeared his paper 'On the Analysis of Mineral Waters.' In this memoir he adverts to many circumstances connected with their general character and sources, and points out the principal re-agents and precipitants used in their examination; the results of his analysis were not accurate, but they were better than those which had previously appeared. His paper on alum has already been mentioned; and although he was well-acquainted with the process of manufacturing it in Sweden, he was unacquainted with the true nature of the salt. In his dissertation on emetic tartar he gives a full historical detail of the modes of preparing it, and its uses; but being unacquainted with the nature of the different oxides of antimony, his ideas as to the antimonial preparations best fitted to form it are not accurate. His memoir on the forms of crystals contains the germ of

the theory of crystallisation afterwards developed by Haüy; he made a considerable number of experiments on silver, and his analyses of the precious stones, though far from accurate, were among the first attempts to ascertain the composition of these bodies.

In 1775 Bergman published his important 'Essay on Elective Attractions'; it was improved and augmented in the third volume of his 'Opuscula,' published 1783, and was translated into English by Dr. Beddoe. In this treatise Bergman considers every substance as possessed of a peculiar attractive force for every other substance with which it unites, a force capable of being represented numerically: he also considered decomposition as complete; that is, whenever a third body c , is added to a compound $a b$, for one of the constituents of which it has a stronger attraction than that which exists between the two, the compound body will be decomposed, and the whole of one of its elements transferred to the body added. Thus, suppose the attraction of a for b to be represented by 1, and of a for c by 2, then the addition of c to $a b$ will produce the compound $a c$, and b will be separated: thus, when lime-water is added to muriate of magnesia, the magnesia is precipitated and a solution of muriate of lime is obtained; and hence when muriatic acid is poured upon a mixture of lime and magnesia, it dissolves the lime and leaves the magnesia. From these and numerous similar facts Bergman called this kind of attraction or affinity 'elective.' This work contains a vast number of experiments; and though the accuracy of his researches and opinions have been called in question, and in many cases upon good ground, the work will long remain a monument of his sagacity and industry.

BERKELEY, GEORGE, son of William, of Thomastown, in the county of Kilkenny, was born at Kilerin, near Thomastown, on the 12th of March, 1684. He received his early education at Kilkenny school under Dr. Hinton, was admitted a pensioner of Trinity College, Dublin, at the age of fifteen, and having stood successfully an examination, he was admitted a Fellow on the 9th of June, 1707. In the same year he published his first work, 'Arithmetica absque Algebra aut Euclide demonstrata,' written before he was twenty years of age, and chiefly remarkable as showing the early bent of his mind and studies. His next work, published in 1709, was 'The Theory of Vision;' in the following year 'The Principles of Human Knowledge' appeared. The perusal of Locke's two treatises on government having turned the attention of Berkeley to the doctrine of passive obedience, he published in 1712 a discourse in favour of it, being the substance of three sermons delivered by him in that year in the college chapel, which passed through several editions. In order to publish his 'Dialogues between Hylas and Philonous,' he left Ireland in 1713 and went to London, where he was introduced to literary and fashionable society by two men very opposite in their political principles—Sir Richard Steele and Dr. Swift. He wrote several papers in the 'Guardian' for the former, and in his house formed a friendship with Pope, which continued during the remainder of his life. Berkeley was recommended by Swift to the celebrated Earl of Peterborough, with whom he set out as chaplain and secretary, in November 1713, on his embassy to Sicily. His lordship however left his chaplain and part of his retinue at Leghorn, and proceeded on his embassy. After his return to England, in August 1714, with Lord Peterborough, he became companion to Mr. Ashe, son of Dr. St. George Ashe, bishop of Clogher, on a tour through Europe, which occupied more than four years. At Paris he visited Malebranche, and entered into a discussion with him on the ideal theory, which was conducted with so much heat that the excitement is said to have hastened the death of the French philosopher. When in Sicily he compiled materials for a natural history of the island, but these papers, together with his journal, were lost during his journey to Naples. On his way home he wrote his tract 'De Motu,' at Lyon, sent it to the Royal Society of Paris, and printed it in London in 1721. Seeing the misery produced about this time by the South Sea scheme, he published 'An Essay towards preventing the Ruin of Great Britain.'

He was now received into the first society. Pope introduced him to Lord Burlington, by whom he was recommended to the Duke of Grafton, lord-lieutenant of Ireland. On becoming chaplain to this nobleman he took the degrees of Bachelor and Doctor in Divinity of Trinity College, Dublin.

About this time his fortune was unexpectedly enlarged. On his first visit to London, Swift had introduced him to Mrs. Esther Vanhomrigh, the celebrated 'Vanessa.' When this lady became dissatisfied with Swift, she altered her will, and left the 8000*l.* which she intended for him, to Mr. Marshal and Dr. Berkeley, her executors. Berkeley did not however publish her correspondence with Swift, though she left this injunction in her will, but committed the letters to the flames. In 1724 Dr. Berkeley was made dean of Derry—a place worth 1100*l.*—and he resigned his fellowship in consequence.

Ever since Berkeley's return to England he had occupied himself with a scheme for the conversion of the North American savages by means of a missionary college to be erected in the Bermudas. He published his plan in London in 1725, and offered to resign his preferment and dedicate his life to this benevolent project on an income of 100*l.* a year. Having prevailed on three junior fellows of Trinity College, Dublin, to accompany him on incomes amounting to 40*l.* per annum, and obtained, by showing the political advantages likely to result from his scheme, a charter for his college, and a promise of

20,000*l.* from the minister, he resisted the temptation of an English mitre offered him by Queen Caroline; and though he married in August 1728, Anne, eldest daughter of Mr. Forster, the Speaker of the Irish House of Commons, he sailed in the middle of the ensuing month for Rhode Island with his wife, a Miss Hancock, two gentlemen of the names of James and Dalton, a valuable library of books, and a large sum of his own property. He took up his residence at Newport, in Rhode Island, and for nearly two years devoted himself indefatigably to his pastoral labours. The government however disappointed him, and he was compelled, after spending much of his fortune and seven years of the prime of his life on forwarding his scheme at home and in America, to leave the scene of his philanthropic enterprise and return to England. Before he left, however, he presented his books to the clergy of the province, and on reaching London took the whole loss upon himself by returning all the subscriptions which he had received. In February 1732, he preached before the Society for the Propagation of the Gospel in Foreign Parts. The same year he published his 'Minute Philosopher,' a series of dialogues on the model of Plato. Of this work Bishop Sherlock of London presented a copy to Queen Caroline, with whom Berkeley had many interviews after his return, and by whose patronage he was promoted on the 17th of March 1734 to the vacant bishopric of Cloyne, a see to which he was consecrated by the Archbishop of Cashel on the 19th of May following. He repaired immediately to the residence at Cloyne, and to the exemplary discharge of all his episcopal duties. Hearing from Addison that their common friend Dr. Garth on his death-bed attributed his infidelity to the opinions of Dr. Halley, whose mathematical education had much influenced Garth, the bishop was induced to write the 'Analyst,' a work addressed "to an infidel mathematician," which excited a good deal of controversy. In 1735 appeared his 'Queries,' proposed for the good of Ireland, and next year his 'Discourse addressed to Magistrates.'

Having received benefit from the use of tar-water when ill with the colic, he published in 1744 'Siris,' a work on the virtues of tar-water, on which he said he had bestowed more pains than on any other of his productions: he published a second edition with emendations and additions in 1747. During the Scotch rebellion in 1745 he addressed a letter to the Roman Catholics of his diocese, and in 1749 another to the clergy of that persuasion in Ireland, entitled 'A Word to the Wise,' distinguished by so much good sense, candour, and moderation, that he received the thanks of the parties whom he addressed. When Lord Chesterfield, in 1745, offered him the see of Clogher, worth twice as much as the one he held, he refused it because he had already enough to satisfy his wishes. His 'Maxims concerning Patriotism' appeared in 1750. His last work was 'Further Thoughts on Tar-Water,' published in 1752. In July this year he determined on going with his family to Oxford, to superintend the education of his son and enjoy the learned retirement to which he was attached. He was however so impressed with the evils of non-residence that he actually petitioned the king for leave to resign his see, but his Majesty was determined he should die a bishop in spite of himself, and refused his application, giving him at the same time permission to reside wherever he pleased.

In July 1752 he removed to Oxford, where he was treated with great respect. On Sunday evening, January 14, 1753, he was seized with what his physicians called a palsy of the heart, and expired so suddenly and quietly that it was only when his daughter went to give him a cup of tea that she perceived he was quite dead. His remains were interred in Christ church, Oxford, and an elegant monument was erected to his memory by his widow. He had three sons and a daughter. Besides the works already mentioned he wrote some smaller pieces, which appeared in a collection printed in Dublin in 1752 under the title of 'Miscellanies.'

The writings of Berkeley, which contain his peculiar opinions, consist in an attack upon the anti-Christian tenets which began to prevail before his time. To look upon his literary labours as a whole, it will be necessary to remember—1, the consequences of the court of Charles II.; 2, the shock which had been given to all prevailing notions of mental philosophy by the introduction of the writings of Locke; 3, the new view of the power of natural philosophy consequent upon the mathematical discoveries of Newton; 4, the extensive remnants of the old philosophy, which insinuated themselves more or less into the newly cultivated branches of science. The 'Minute Philosopher' is addressed to the infidel man of pleasure; the 'Analyst' to the infidel mathematician; the 'Principles of Human Knowledge,' and the 'Dialogues of Hylas and Philonous,' to the infidel metaphysician. We shall take them in order of publication:—

'Principles of Human Knowledge;' 'Dialogues of Hylas and Philonous.'—The prevailing notion of matter, from the earliest ages downwards, had been that of a substance possessing an existence independent of faculties capable of perceiving it. The atheism of several ancient sects was entirely based upon a notion that matter might exist without a God, or in conjunction with, though independently of, a God. The argument of Berkeley may be divided into two parts: in the first he attacks the common notion of matter by the assertion that there is no proof of its existence anywhere but in our own perceptions; in the second he asserts the impossibility of any such independent existence. The first point is, and always will be, mis-

understood by those who do not pay the closest attention to the meaning of his terms. For instance, Dr. Samuel Johnson, who was frequently happy in perceiving verbal distinctions, said he refuted Berkeley's theory by stamping with his foot upon the ground. That is, he imagined that Berkeley denied the existence of the perception of solidity, which of course was not the case.

To the believer in an intelligent Creator (and it is only to such that the negative part of Berkeley's argument applies) the case may be thus put:—You admit that your existence and your power of perceiving, as well as the perceptions by which the second makes you know the first, are ultimately (whatever may be the intermediate steps) to be traced to the will of the Creator. You cannot figure to yourself the uniform nature of the perceptions which you receive as coming directly from the Creator, but you suppose a power of imparting them to be made inherent in a certain 'substratum' (this is Berkeley's word) which you call matter! But if you admit that it is in the power of the Creator to furnish you directly with those ideas of space, figure, colour, &c., which to you constitute the material world, without any intervention of which you can form a positive conception; how do you know that he has not done so? The answer must be that there is no such knowledge; and this is the point on which Berkeley has never been, and it is not too bold an assertion to say never can be, refuted.

The positive part of Berkeley's theory, in which he asserts the impossibility of matter, lays him open to precisely the same answer which those may receive who actually assert its existence. We cannot in our limits show the several grounds on which he supposes he has established his point. He has a notion that what he calls an 'idea' (we should say 'perception') cannot be imparted unless there be something resembling the idea in that which communicates. It is very difficult to abbreviate an argument which handles the nature of ideas; but the leading notions seem to us to be contained in the following quotation ('Works,' v. i. p. 26), with which we shall close this part. The reader will observe that axioms are assumed as doubtful at least, and by no means so convenient as that of the existence of matter; also that the first paragraph assumes the point in question:—

"Some truths there are so near and obvious to the mind that a man need only open his eyes to see them. Such I take this important one to be, to wit, that all the choir of heaven and furniture of the earth, in a word, all those bodies which compose the mighty frame of the world, have not any subsistence without a mind; that their being is to be perceived or known; that consequently so long as they are not actually perceived by me, or do not exist in my mind or that of any other created spirit, they must either have no existence at all, or else subsist in the mind of some eternal spirit.

"There is not any other substance than spirit, or that which perceives. . . . For an idea to exist in an unperceiving thing is a manifest contradiction; for to have an idea is all one as to perceive; that therefore wherein colour, figure, and the like qualities exist, must perceive them; hence it is clear there can be no unthinking substance or substratum of these ideas."

"But, say you, though the ideas themselves do not exist without the mind, yet there may be things like them whereof they are copies or resemblances, which things exist without the mind, in an unthinking substance. I answer, an idea can be nothing but an idea; a colour or figure can be like nothing but another colour or figure."

'Alciphron, or the Minute Philosopher.'—This is a series of dialogues between two atheists and two Christian theists. The former are of the class of 'good company' philosophers who have disappeared with 'wit' and 'veritas.'

'The Analyst' and 'Defence of Freethinking in Mathematics.'—The object of these tracts (the second of which is a rejoinder to a reply to the first) is, by pointing out the difficulties in the subject of fluxions, then almost newly invented, to show one of two things: either that mathematicians were not such masters of reasoning as to make their opinions on religious subjects more valuable than those of other people; or else that there were, in the science of fluxions, incomprehensible points as difficult as those of religion, and yet logically established. It was a very dangerous use of analogy, considered with reference to the interests of the cause it was meant to serve; but it is by no means the only instance of an attempt to place mathematical on a similar footing with moral difficulties. The points on which Berkeley insisted have since been cleared up, and the publication of the 'Analyst' was the immediate cause of the work of Maclaurin on the subject.

The style of Berkeley is very clear, and his bold method of thinking, and absence of all adhesion to great authorities, make his works even now valuable to the student. These same qualities make them difficult to describe, and the peculiar nature of the subjects which he treated has caused them to be misrepresented, so that their true scope is less understood than that of any other writings of his day.

(See his 'Life,' prefixed to his works published in 2 vols. 4to in 1784, written by the Rev. Dr. Stock from particulars furnished by Berkeley's brother, and first published anonymously in 1776. An edition of his works has been since published in 3 vols. 8vo.)

BERKENHOUT, DR. JOHN, the son of a Dutch merchant, was born at Leeds about the year 1730. He was educated partly at the grammar school of that town and partly in Germany, and he afterwards

made the tour of Europe in company with one or more English noblemen. He then entered the Prussian service as a cadet, and rose to the rank of captain. When the war broke out between England and France in 1756, he quitted the Prussian and obtained a company in the English service. On the conclusion of peace in 1760 he left the army, and commenced the study of physic at Edinburgh. During his residence there he wrote a work entitled 'Clavis Anglica Linguae Botanicae, or a Botanical Lexicon, in which the terms of botany, particularly those which occur in the works of Linnaeus and other modern writers, are applied, derived, explained, contrasted, and exemplified,' London, 1764, small 8vo. It is a useful little work, and perhaps the first of its kind published.

Berkenhout took the degree of Doctor of Physic at Leyden in 1765, on which occasion he published his 'Dissertatio Medica Inauguralis de Podagra,' dedicated to his relation Baron de Bielfeld (4to, pp. 28). On returning to England, Dr. Berkenhout settled at Isleworth in Middlesex; and until his death, which took place in 1791, employed a great part of his time in writing on an immense variety of subjects. In 1766 his 'Pharmacopoeia Medici' appeared, which reached a third edition in 1782. His 'Outlines of the Natural History of Great Britain and Ireland' came out by a volume at a time in 1769-71. The copy at the British Museum is bound up with a short treatise entitled the 'Naturalist's and Traveller's Companion' (London, 1772, 8vo, pp. 69). It has no name, but is probably by the same indefatigable author.

In 1771 he published 'Dr. Cadogan's Dissertation on the Gout examined and refuted,' and in 1777 'Biographia Literaria, or a Biographical History of Literature, containing the Lives of English, Scottish, and Irish authors, from the dawn of Letters in these kingdoms to the present time, chronologically and classically arranged,' London, 1771, 4to, pp. 537. This volume contains the authors who lived from the beginning of the 5th to the end of the 16th century. In a very long preface, dated from Richmond in Surrey, the author promises his readers a second, third, and fourth volume, but they never made their appearance.

Dr. Berkenhout's next work was 'A Treatise on Hysterical Diseases, translated from the French.' In 1778 he was sent with certain commissioners appointed to treat with America, and on his return obtained a pension in consideration of his political services, and the loss sustained by him in giving up his practice for a time. In 1780 he published 'Lucubrations on Ways and Means, inscribed to Lord North.' His next work was an 'Essay on a Bite of a Mad Dog,' and in the following year he published his 'Symptomatology.' In 1788 appeared Dr. Berkenhout's 'First Lines of the Theory and Practice of Philosophical Chemistry,' never a very valuable and now an utterly useless work.

In 1779 he published a continuation of Campbell's 'Lives of the Admirals,' 4 vols. 8vo. His last publication, according to the writer of his life, was 'Letters on Education, to his Son at Oxford,' 1791, 2 vols. 12mo. Probably this is a mistake. We have seen a similar work entitled 'A Volume of Letters from Dr. Berkenhout to his Son at the University,' but it is in one octavo volume (of 374 pages), is printed in 1790, and addressed to a son at the University of Cambridge. It is a very poor production. Dr. Berkenhout, though certainly undeserving of the lavish panegyrics of his friends, was an active, energetic, and indefatigable writer; and though he has no claim to the rare praise of creating knowledge, it would be unjust to deny him the credit due to those who acquire and diffuse it.

BERLICHINGEN, GOETZ VON, a German knight, a petty feudal lord of Suabia, notorious in the history of the middle ages for his bravery and his lawless turbulence. He lived during the reign of the Emperor Maximilian I., the predecessor of Charles V. Goetz was called Iron-Handed, because, having lost his right hand in battle, he had a steel one made with springs, by means of which, it is said, he could still handle his lance. He was often at war with his neighbours, and at times took the part of the peasantry against the nobles. In 1513 he declared war against the free imperial town of Nürnberg. With 170 men he waylaid the merchants returning from Leipzig, plundered them of all they had, and consigned many to his dungeons, in order to exact a ransom for them. Upon this the emperor put him under the ban of the empire, and sentenced him to pay 14,000 florins. The money was collected after some difficulty, and the offender was restored to his civil rights. Having again offended the emperor, he was at last besieged in a castle by the imperial troops, where he defended himself desperately, but was wounded, and died. Göthe has taken him for the subject of one of his dramas, 'Goetz von Berlichingen,' still very popular in Germany, as being a picture of the manners and social state of the latter part of the middle ages, before the imperial authority was thoroughly enforced through the country by means of standing armies, well disciplined, and provided with artillery. Göthe's drama has been translated by Sir Walter Scott.

*BERLIOZ, HECTOR, was born at Côte-St.-André, in the department of Isère, in France, on December 11, 1803. His father, a physician, desirous of bringing him up to that profession, resolutely refused the supplications of the son to be allowed to devote himself to music, to which he was profoundly attached, and wherein he felt he could distinguish himself. He was however allowed to study music in his leisure hours. When he had attained the age of twenty he was sent to Paris to complete his medical studies; but he soon deserted the lectures of the faculty; entered the Conservatoire de

Musique, studied composition at first under Lesueur, and finally under Reicha. In 1828 he won the second prize, in 1830 the first prize at the Conservatoire by his cantata of 'Sardanapalus.' This gave him the privilege of visiting Italy as a pensionary of the Academy of Fine Arts. In Italy he remained eighteen months, displaying a fantastic, irregular, but rich musical taste. On his return he produced at the Conservatoire an overture to 'King Lear;' and 'Harold,' a symphony, was also performed there about 1833. In 1837 he produced a Requiem, performed in the church of the Invalides at the funeral of General Damrémont, with marvellous effect. This was followed by 'Benvenuto Cellini,' an opera in two acts, represented on September 3, 1838. It did not succeed: it had abandoned the old rules of art, and it gave rise to a war of words, in which the very fundamental principles of the art had to be discussed, and during which passion gave little opportunity of judging impartially either the merits or defects of the work. In November 1839 the grand dramatic symphony of 'Romeo and Juliet' was performed at the Conservatoire, and produced a vivid sensation. Shortly afterwards Berlioz was decorated with the cross of the Legion of Honour. The 'Symphonie funèbre et triomphale,' written in 1840, for the inauguration of the column in the Place de la Bastille, added considerably to his reputation. He has greatly distinguished himself as the conductor of an orchestra, and it was to him that the great reunion of 1200 musicians was owing, which, in 1840, under his conduct, performed the Hymn to France, which he had written for the occasion. He has since that date conducted numerous concerts in Germany, Russia, and in England.

Though there may be various opinions of M. Berlioz's rank as a musician, all must agree that his compositions have a style and an individuality which must tend to increase the sphere of the art. M. Berlioz is also well known as an accomplished musical critic, having been the recognised contributor in that capacity to the 'Journal des Débats.' He is at present librarian to the Conservatoire de Musique. We have not attempted to give a catalogue of his works: they are very numerous, and constantly increasing.

(*Conversations-Lexikon; Nouvelle Biographie Universelle.*)

BERNARD, EDWARD, was born May 2, 1638, at Pauler's Perry, near Towcester, in Northamptonshire, of which place his father was rector. He was educated first at Northampton, and afterwards at the Merchant Tailors' school, London, under Dugard. In June 1655 he was elected scholar of St. John's College, Oxford. Here he turned his attention to the Hebrew, Syriac, Arabic, and Coptic languages, in addition to the pursuits of the place, and also to mathematics, which he studied under Wallis. In 1658 he was made Fellow of his college, B.A. in 1659, M.A. in 1662, B.D. in 1667, and D.D. in 1684. In 1668 he went to Leyden to consult manuscripts, and brought home the three books of Apollonius, which Golius had brought from the east. About 1669, Christopher Wren being appointed architect to the king, obtained leave to have a deputy for the duties of the Savilian professorship of astronomy, and he appointed Bernard. The latter obtained at the same time a living and a chaplaincy; but these he resigned in 1673, when Wren finally resigned his professorship. The Savilian professors are not allowed to hold any church preferment, and Bernard at this time desired to succeed Wren. This he did against the advice of friends, who were unwilling that he should quit the road of preferment. The design which was then formed, and afterwards executed, of reprinting all the old mathematicians at Oxford, seems to have been his great inducement. In 1676 he went to France as tutor to the dukes of Grafton and Northumberland, the sons of Charles II. by the Duchess of Cleveland. He staid only a year, not being satisfied (Dr. Smith hints) with the treatment he received. In 1683 he went to Holland, to be present at the sale of the library of Heinsius; and being now disgusted with his situation at Oxford, would have remained at Leyden if he could have obtained the professorship of Oriental languages. He was however unable to obtain any means of extricating himself till the year 1691, when Mewes, bishop of Winchester, gave him the rectory of Brightwell in Berkshire. He was succeeded in the professorship by David Gregory, and subsequently by Halley. Under these two the reprints of the old mathematicians were made which distinguished the Oxford press of that period; and the labours of Dr. Bernard, who passed his life in searching for and collating manuscripts, were of the greatest preliminary service. In 1693 he married; in 1696 he went again to Holland, to be present at the sale of the library of Golius. He died at Oxford soon after his return, January 1697, having lived a most industrious and useful life. He left behind him a large number of papers, some of them unfinished. Of his printed works, the most important was 'Of the Ancient Weights and Measures,' published at the end of Pococke's Commentary on Hosea, Oxford, 1685; reprinted with large additions, Oxford, 1688, in Latin, under the title of 'De Mensuris et Ponderibus Antiquis libri tres.' It contains a good index, and an appended letter by Hyde, on the Chinese weights and measures. This is a work of learning, and one of the best which remain on the subject. Arbutnot, in his work on ancient weights and measures, never cites it, and does not seem to be aware of its existence, which, considering the nature of the subject, very much adds to the utility of both works for the purposes of comparison, unless the second work be taken from the first, of which we do not see any very obvious signs. The work of Aristarchus, as published by Wallis, was collated

by Bernard, and the result of his collation of the text of Euclid may be said to be published in Gregory's celebrated edition. A life of Bernard was published in 1704 by Dr. J. Smith, in which a catalogue of both his unpublished papers and his printed works will be found.

BERNARD, ST., abbot of Clairvaux, was born at Fontaine, in Burgundy, in the year 1091. His father was Teclinius, a nobleman and a soldier: his mother's name was Aleth. Both his parents were persons of great piety, according to the notions of that age. Bernard was the third of seven children. From his infancy he was devoted to religion and study, and after having been educated at the university of Paris, at that time one of the most celebrated seats of learning in Europe, at the age of twenty two he entered the Cistercian monastery of Cîteaux, near Dijon in Burgundy. His influence on the minds of others, even at that early age, is shown by his inducing upwards of thirty of his companions, including his five brothers, to accompany him in his retreat. The Cistercian order was at that time the strictest in France, and Bernard so recommended himself by the most rigorous practice of its austerities, that in the year 1115 he was selected as head of the colony which founded the abbey of Clairvaux in Champagne. For some time he practised such severities as to injure his health, but he afterwards acknowledged his error, and relaxed his discipline, both with respect to himself and others.

His reputation soon rose so high, that in 1128 he was employed by the grand master of the Templars to draw up the statutes of that order. Such was his influence, that he prevailed on the king, clergy, and nobility of France assembled at Étampes, near Paris, to acknowledge Innocent II. as legitimate pope, in opposition to his competitor Anacleto ('L'Art de vérifier les Dates,' Concilium Stampense and Innocent II.), and afterwards succeeded in obtaining the same acknowledgment from Henry I. of England. Some time after he was offered the archbishopric of Milan by the clergy of that city, which he refused. In the course of his life he also refused the archbishoprics of Genoa and Rheims, as well as many other ecclesiastical dignities. Having condemned as heretical some propositions in the works of the celebrated Abelard, he was challenged by him to a public controversy. At first he wished to decline the challenge, but at last accepted it, at the pressing instances of his friends. In the year 1140 they met at the council of Sens in Champagne, but before the discussion was completed, Abelard appealed to the pope; the council agreed with Bernard in condemning the propositions, and by order of the Pope, Abelard was confined in the monastery of Cluni, in Burgundy.

At the council of Vézelay, on the confines of Burgundy and Nivernois, in the year 1146, Bernard persuaded the king and nobility of France to enter on a crusade. On this occasion he went so far as to claim inspiration, and to prophesy the success of the undertaking. This is the most reprehensible part of his career, and he attempted to cover the failure of his prophecy by a poor quibble. In the same year a council was held at Chartres, where the crusaders offered St. Bernard the command of the army, which he refused. In 1147, at the council of Paris, he attacked the doctrine of Gilbert de la Porrée, bishop of Poitiers, on the Trinity; and in the following year, at the council of Rheims, procured its condemnation. During the course of his life he successfully combated several other heresies. The last act of his career was his mediation between the people of Mentz and some neighbouring princes. On his return to his convent he fell ill and died in 1153. He was canonised in the year 1174, by Pope Alexander III., and the Roman Church celebrates his festival on the 20th of August. His works, which have procured for him from Roman Catholic writers the honourable appellation of the last of the fathers, have been repeatedly published. The best edition is that by Mabillon, 2 vols. folio, Paris, 1719, which, besides his undoubted works, contains several productions attributed to him on less authority.

(Miltre, *History of the Church*; Waddington, *History of the Church*; Mosheim, *Ecclesiastical History*; Neander, *St. Bernard and his Times*.)

BERNERS, JOHN BOURCHIER, LORD, was born about the year 1474. He was the eldest son of Sir Humphrey Bouchier, who was the son of Sir John Bouchier, the fourth son of the Earl of Ewe by his wife Anne, daughter of Thomas, duke of Gloucester, the youngest son of Edward III. This Sir John was created Lord Berners in honour of the family of his wife Margery, who was the daughter and heiress of Richard Lord Berners, the father, as it is supposed, of Juliana Berners, the authoress of part of the famous book on field-sports. Admitting the presumptive evidence in favour of Juliana's connection with this family, it is pleasant to find two persons in it, of different sexes, so honourably distinguished.

The Bouchier family adhered to the house of York during the war of the Roses; and Sir Humphrey Bouchier was killed at the battle of Barnet in 1471 in support of its cause, being, according to Hall, the only person of rank on Edward's side who was slain in the action. His son, the subject of the present notice, succeeded his grandfather when he was only seven years of age, and when he was only eleven the Order of the Bath was given him by Edward IV. Lord Berners was sent to Oxford at an early age, as was then the custom, and Wood believes, but is not certain, that he was educated at Balliol College, and adds, "after he had left the university he travelled into divers countries, and returned a master of several languages and a complete gentleman." His youth and absence prevented him from taking any

part in public affairs until Henry VII. had established himself on the throne. It seems however that the usurpation of Richard III. made the Bouchier family favourable to Henry. They supported him, and he was ultimately crowned by Cardinal Bouchier, the grand-uncle of Lord Berners.

Lord Berners was first called to parliament in the 11th of Henry VII. by the style of John Bourchier, lord of Berners; and it seems that he had previously attended the king at the siege of Boulogne in the year 1492. He first acquired personal distinction and the favourable regard of the king by the active part he took in putting down the insurrection which in 1497 broke out in Cornwall, headed by Michael Joseph, a blacksmith, and a lawyer named Flammoek, and afterwards supported by Lord Audley. He appears to have become a favourite of Henry VIII. very soon after his accession, and he had the rare fortune of retaining his favour to the last. About 1515 he was appointed Chancellor of the Exchequer for life; and about the same time was one of the splendid train of nobles, knights, and ladies appointed to escort to Abbeville the Lady Mary, the king's sister, who by the peace of 1514 was to be married to Louis XII. of France. In the year 1518 Lord Berners was associated with John Kite, archbishop of Armagh, in an embassy to Spain, in the hope of detaching the young king of Spain from the interests of the French king Francis, and of bringing him over to the views of Wolsey, the pope, and the emperor. After his return his age and growing infirmities occasioned him to live much in retirement in his government at Calais, to which important office he appears to have been appointed soon afterwards. He remained in this situation until his death, on the 19th of March 1532, devoting his leisure to those literary undertakings for which alone he is now remembered.

His great work, the translation of Froissart's 'Chronicles,' was undertaken by the king's command; the first volume was printed by Pynson in the year 1523, and the second volume in 1525. For common use this translation has been supplanted by the modern one of Mr. Johnes; but Lord Berners's translation was reprinted in 1812, under the direction of Mr. Utterson, who very properly considered that it was still of great value for the appropriate colours with which it portrays the manners and customs of our ancestors. Sir Walter Scott justly remarked in reviewing Johnes' translation, that Berners had the advantage of using in his version a language in which the terms of chivalry were still in use, while its feelings and principles, and even its practice, were still fresh in recollection. The old translation therefore, though somewhat antique in style, is far the most picturesque. Others of his works were a whimsical medley of translations from French, Italian, and Spanish novels, which seem to have been the mode then; and he wrote a comedy called, 'Ite in vineam meam,' which was usually acted in the great church of Calais after vespers. Neither of the two last-named works was printed, and it is not known whether the comedy was in Latin or English.

(Preface to Utterson's edition of Lord Berners' translation; Wood, *Athenæ Oxonienses*, by Bliss; Walpole's *Royal and Noble Authors*, &c.)
BERNERS, JULYANS, or JULIANA, otherwise BARNERS or BARNES, one of the earliest female writers in England, is supposed to have been born towards the latter end of the 14th century at Roding Berners, in the hundred of Dunmow, and county of Essex. The received report is, that she was daughter of Sir James Berners, of Roding Berners, knight, whose son Richard (created Lord Berners in the reign of Henry IV.) was the father of the translator of Froissart; and that she was once prioress of Sopewell Nunnery in Hertfordshire. It seems that she was alive in 1460. Hollingshed places her at the close of the reign of Edward IV., calling her "Julian Bemes, a gentlewoman endued with excellent giftes bothe of body and minde, [who] wrote certain treatises of hawking and hunting, delighting greatly herself in those exercises and pastimes. She wrote also a booke of the laws of armes and knowledge apperteyning to heraldea." This seems the amount of all the information concerning this lady which can now be traced, and even these scanty particulars have in some instances been doubted.

The following is the collected title of the treatises attributed to Juliana Berners, as printed together by Wynkyn de Worde in 1486. 'The Treatyses perteynyng to Hawkyng, Huntynge, and Fysshynge with an Angle: and also a right noble Treatyse of the Lygnage of Cot Armours, endynge with a Treatise which specyfeth of Blawynge of Armys.' From the researches of Mr. Hazlewood, it would seem Juliana herself wrote only a small portion of the treatise on hawking, the whole of the treatise upon hunting, a short list of the beasts of the chase, and another short list of persons, beasts, fowls, &c. The great interest attached to the subjects of this work occasioned the treatises to be among the very first that were put to press on the introduction of printing into this country, when they were printed at the Abbey of St. Albans, on which the nunnery of Sopewell was dependent. The first edition is said to have been printed in 1481, and it is certain that one was printed in 1486. The colophon to the treatise on fishing (which is the best of the four), states that it was introduced in order that it might be better known than it would be if "enprynted alone by itself and put in a lityll plaunflet." The colophon to the treatise on heraldry also describes it as translated and compiled at St. Albans. The 'Treatise on Hunting,' which is the undoubted work of Juliana Berners, describes the manner in which various animals are to be

hunted, and explains the terms employed in venery. The information is hitched into rhyme, but, as Mr. Ellis remarks, "has no resemblance to poetry." All the other treatises are in plain prose. A fac-simile reprint of the whole of Wynkyn de Worde's edition, was made in 1810, under the direction of Mr. Hazlewood, whose prefixed dissertations seem to have exhausted every source of information.

(Dibden's continuation of Ames's *Typographical Antiquities*; Warton, *History of English Poetry*.)

BERNI, FRANCESCO, was born about 1490 at Lamporecchio, a village of the Val di Nievole in Tuscany, of a noble but poor family. He studied for the church, and became a priest. Having gone to Rome to try his fortune, he entered the service of Cardinal Divizio da Bibbiena, his countryman and relative, who was in great favour with Leo X. After the cardinal's death, he passed into the service of the cardinal's nephew, Angelo Divizio, a prelate of the court of Rome. His next employment was as secretary to Ghiberti, who was datario to Pope Clement VII., and also bishop of Verona; but, according to his own confession, he found himself little qualified for his office. He remained with Ghiberti for seven years, during which he accompanied his master, or was sent by him on business, to several parts of Italy. He was present at the plunder of Rome by the Spaniards and Germans in 1527, of which he speaks in his 'Orlando Innamorato.' (See canto xiv.) About the year 1530, or 1531, he left Ghiberti and went to Florence, where he was made a canon of the cathedral, a preferment which enabled him to live in a sort of affluence for the rest of his days. His facetiousness and social conviviality recommended him to the Duke Alessandro, as well as to his cousin, Cardinal Ippolito de' Medici, the son of Giuliano, and nephew of Leo X., and a story became current some years after his death, that having been requested by each of the cousins to poison the other, he had refused, and had been consequently poisoned himself by one of them. But Berni survived Ippolito a year, when neither the cardinal could any longer poison him, nor the duke stood any more in need of Berni's instrumentality. Accordingly, Mazzuchelli and other critics have utterly discarded the story as having no foundation in truth. The date of Berni's death has been long a matter of dispute: some place it in 1543, but Molini, in the introduction to his edition of the 'Orlando,' fixes it on the 26th of May 1536, on the authority of Salvino Salvini's chronological register of the canons of the cathedral.

Berni is the principal writer of Italian jocose poetry, which has ever since retained the name of 'Poesia Bernesca.' Burchiello, Pucci, Bellincioni, and others, had introduced this style of poetry before him, but Berni gave it a variety of forms, and carried it to a perfection which has seldom been equalled by any one since. Berni was well acquainted with the Latin and Italian writers, and he often alludes to them for the purpose of contrasting some of their lofty images with others which are trivial. His satire is generally of the milder sort, but at times it rises to a most bitter strain of invective. Such, for instance, in his 'Capitolo' against Pope Adrian VI., whose very virtues made him unpopular with the Romans. Berni's humour may be said to be untranslatable, for it depends on the genius of the Italian language, the constitution of the Italian mind, and the habits and associations of the Italian people. Berni's expressions are carefully and happily selected for effect, and although he speaks of the haste in which he wrote, it is proved by the manuscripts of his burlesque poems that he corrected and recorrected every line. His language is choice Tuscan. The worst feature in Berni's humorous poems is his frequent licentious allusions and equivocations, which, although clothed in decent language, are well understood by Italian readers.

Berni's poems were not collected till after his death, with the exception of one or two published in his lifetime. The first edition of part of his poems was made at Ferrara in 1537. Grazzini published one volume of Berni's 'Poesie Burlesche,' together with those of Mauro, Varchi, Della Casa, &c., in 1548. A second volume appeared in 1555; a third volume was published at Naples with the date of Florence, in 1723. There is also an edition of the 'Poesie Burlesche' in two vols. 8vo, London, 1721-24, with notes by Salvini.

Berni is also known for his 'Rifacimento,' or recasting of Bojardo's poem 'Orlando Innamorato.' Berni altered the diction of the poem into purer Italian, but he left the narrative exactly as it was from beginning to end. He also added some introductory stanzas, moral or satirical, to most of the cantos, in imitation of Ariosto's practice, and also a few episodic sketches in the body of the poem, the principal of which is that in canto 67, where he describes himself and his habits of life. It cannot be maintained that Berni has turned Bojardo's serious poem into burlesque: he merely steps in as a third person, after the fashion of the old story-tellers, between the original poet and the audience, moralising upon what he relates, or reverting, from the errors and follies of his heroes, to the vices and follies of men in the every-day world. The sincerity and simplicity of his practical moralising strain contrasts with the prodigious and absurd magnificence of the romantic narrative, which Berni however relates with all the appearance of credulity. Some of Berni's openings to the various cantos are remarkably fine, and perhaps superior to those in Ariosto's poem. With regard to his alterations of Bojardo's text, it is generally allowed that he has improved it in many parts, though not in every instance. It appears also that several parts of the 'Rifacimento,' such as we have it, and which are very inferior to the rest,

were either not written by Berni, or have not received from the author the last correction and polish.

Berni wrote some Latin poems, which were published in Florence in 1562, in the Collection 'Carmina quinque Etruscorum Poetarum.' He wrote also 'La Catrina' and 'Il Mogliazzo,' which are dramatic scenes in 'lingua rustica,' or idiom of the Florentine peasantry (Florence, 1537-67).

Berni is an author who ought to be attentively studied by Italian scholars. His mastery over his language, and the ease and purity of his diction, have been seldom equalled. His humour, though often broad, is not low: it is sharp and clever. His skill is not easily appreciated, because it is clothed with the appearance of extreme simplicity.

There was another Francesco Berni, of Ferrara, who lived in the 17th century, and wrote several poetical works.

(Mazzuchelli, *Scrittori d'Italia*; Stewart Rose, *Life of Berni*, prefixed to his *Analysis of the Innamorato*; Panizzi, *Life of Bojardo*.)

BERNIER, FRANÇOIS. This "most curious traveller," as he is styled by our historian Gibbon, was born at Angers, then the capital of the province of Anjou. The year of his birth has not been ascertained, and very little appears to be known about him, until after his return from the East, and the first publication of his travels. Voltaire supposes that he was born in the year 1625. But it seems quite as probable that he was born eight or ten years later. He studied medicine as a profession, and after taking his degree of Doctor at Montpellier, being, as he tells us himself in the first page of his book of travels, excited by the desire of seeing the world, he went over to Palestine and thence into Egypt. This was in the year 1654. He lived more than a year at Cairo; caught the plague, and had the rare good fortune of recovering from that fearful disease. Being in Egypt he became very desirous of visiting and examining the Red Sea; and, while on the shores of the Red Sea, a favourable opportunity presented itself for going into the East Indies. In all the countries of the East a medical practitioner may travel very well, and live as well as the best, without any money. Bernier's purse seems always to have been very light. He lived twelve years in India, and during eight of these years he resided chiefly at Delhi as physician to the great Mogul emperor of Hindustan, Aurungzebe, who took him along with him when he marched to the conquest of Cashmere. Bernier has left us the best accounts of that war, of the march of this immense army, and of the beautiful country which it subdued. The correctness of Bernier's description of the country has been recognised and praised by every European traveller that has visited Cashmere since his time.

Returning to France, his native country, Bernier began to publish. His first work, entitled 'History of the last Revolution of the States of the Great Mogul,' appeared at Paris in the year 1670, in two very humble 12mo vols. This was followed by 'Continuation of Memoirs of the Empire of the Great Mogul,' which was published at Paris in the year 1671 in one vol. 12mo. The books contained a vast deal of information that was altogether new to Europe at that time, and they were written with great spirit, and with that admirable brevity and simplicity which distinguished many of the old French travellers. They at once made him famous in Paris, and they soon became universally known. They were quickly reprinted, as one work, under the altered title of 'Travels of François Bernier, Doctor in Medicine of the Faculty of Montpellier, containing the description of the States of the Great Mogul, of Hindustan, of the Kingdom of Cashmere,' &c. These travels have been rather frequently reprinted, and have been translated into most European languages. The English translation by Mr. Irving Brock appears to be carefully and correctly done. It is in two vols. 8vo, and was published in London in the year 1826. There is a modern French edition of the original in two vols. 8vo, Paris, 1830.

Bernier's travels contain much valuable history: they describe the causes of that important revolution which raised Aurungzebe to the throne of Hindustan; and as the author was personally engaged in the scene of action, and an eye-witness of many of the principal events, which he relates in such simple and interesting language, the narrative is the more valuable and trustworthy. Major Rennell ('Memoir for Illustrating the Map of Hindustan') calls Bernier "the most instructive of all East India travellers."

Although it was what some call the golden age of Louis XIV., Bernier does not appear to have tasted of the patronage and bounty of the court. His philosophical treatises have long been neglected or forgotten. It is said that he took to writing them for the instruction and amusement of Madame de la Sablière, who dabbled in geometry, astronomy, and the natural sciences, as well as in the belles-lettres. Gassendi's philosophy was then in vogue; but his works were rather too difficult and too voluminous for ladies and wits. In 1674-75 Bernier published an abridgment of the philosophy of Gassendi. In the second part of this abridgment he treats of the systems of Ptolemaeus, Copernicus, and Tycho Brahe, and gives a refutation of judiciary astronomy. This work was much read or very much praised at the time. He wrote a memoir on the quietism of the Indians, which was inserted in the 'Histoire des Ouvrages des Savants,' 1688. His other things seem mostly mere jeux-d'esprit. His jokes against the Aristotelian philosophy ('Ariet donné en la Grande Chambre du Parnasse

pour le Maintien de la Philosophie d'Aristote') are given in the 'Ménagiana.' Bernier visited England in 1685, and died at Paris on the 22nd of September 1688.

(*Biographie Universelle*; Bernier's own Works and Prefaces.)

BERNINI, GIOVANNI LORENZO, born at Naples in 1598, was the son of Pietro Bernini, a Florentine painter and sculptor. While young Bernini was still a child, his father removed with his family to Rome, being commissioned by Pope Paul V. to work at the Borghese Chapel in Santa Maria Maggiore. Young Bernini showed a remarkable disposition for sculpture; and at ten years of age having made a head in marble, which was generally admired, the pope sent for him, and recommended him to the care of Cardinal Maffeo Barberini. At seventeen years of age Bernini made the fine group of Apollo and Daphne, which was afterwards placed in the Villa Borghese. He studied architecture at the same time, as well as sculpture. Gregory XV., who succeeded Paul V., employed him in several works, bestowed on him pensions, and made him a knight. After Gregory's death, when Cardinal Barberini was elected pope under the name of Urban VIII., Bernini became his favourite architect and sculptor, and then executed the great works which have established his fame, of which the following are the principal:—The Confession of St. Peter's, that is, the bronze columns and canopy under the dome, at which he worked for nine years, and for which he received 10,000 scudi, besides a pension and two livings for his brothers; the palace Barberini and the fountain in the square before it; the front of the College de Propaganda Fide. He constructed besides several other fountains in Rome, and various works and ornaments in the interior of St. Peter's; among others the niches and staircases in the piers which support the cupola. Among his other works Bernini made a head of Charles I. of England, for which he was handsomely remunerated. Cardinal Mazarin invited him to France, and offered him a rich pension, but Pope Urban would not permit him to leave Rome, nor was Bernini himself inclined to leave a city where he was the acknowledged arbiter of public taste. When forty years of age Bernini married Caterina Fezi, the daughter of a respectable citizen of Rome. His life from that time became extremely regular; he lived frugally, worked hard, and assiduously, being sometimes for seven hours together at his chisel. He did not interrupt his work for any strangers who came to visit his study, whether princes or cardinals; they stepped softly in, and sat down to look at him in silence. Under the pontificate of Innocent X., who succeeded Urban VIII., Bernini made the great fountain in the Piazza Navona, and he also began the palace of Monte Citorio. By Alexander VII. he was commissioned to execute the great work of the piazza before St. Peter's; he made the splendid colonnade and also the great staircase leading from the portico of the church to the Vatican palace. He next made the Cattedra, or great chair of St. Peter's, of gilt bronze. The elegant church of Sant' Andrea à Monte Cavallo is likewise by him.

Bernini visited Paris in 1665, on the urgent invitation of Louis XIV. His journey was a triumphal procession: he made his public entrance into Florence, and was received by the grand duke with the greatest honours. At Turin, at Lyon, and every where on the road, he was received with similar honours. He remained for about eight months in Paris, and was employed in several works of sculpture, among others a bust of Louis XIV., for which he was splendidly remunerated; but he declined to interfere with the designs of Claude Perrault, who was then engaged on the Louvre, and indeed did nothing at Paris in the way of architecture. On his return to Rome, in token of gratitude, he made an equestrian statue of Louis XIV., which was afterwards placed at Versailles. When eighty years of age, Bernini executed a Christ in marble, and presented it to Queen Christina of Sweden, who had been his constant patroness, but she declined to accept it, saying that she was not rich enough to pay for it as it deserved. Bernini however bequeathed the statue to her by his will. He died at Rome in 1680, eighty-two years of age, honoured and regretted by all, and was buried in the church of Santa Maria Maggiore. He left a property of about 400,000 scudi, nearly 100,000£ sterling. He was one of the most successful and best remunerated artists that has ever lived. But his subsequent fame, though great, is much less than that he enjoyed during life.

Bernini was a painter as well as a sculptor, and left about 150 paintings, most of which were purchased for the galleries of Barberini and Ghigi. Of his works of sculpture and architecture, which are very numerous, Milizia gives a list in his life of Bernini. (Milizia, 'Vite degli Architetti'.)

BERNSTORF, JOHANN HARTWIG ERNST, COUNT VON, a younger son of Joachim Engelke, Baron Von Bernstorf, chamberlain to the elector of Hanover, was born at Hanover May 13, 1712. His education was conducted by the learned Keysler, and in his company he travelled through the principal states of Europe. Having visited Denmark, he obtained from Christian VI., in 1732, the appointment of minister at the court of Augustus II., elector of Saxony and king of Poland. In 1737 he became envoy from Denmark to the Germanic diet at Ratisbon, and from 1744 to 1750 resided in France as Danish ambassador. In 1751 Frederic V. appointed him minister for foreign affairs, which office he filled till the ascendancy of Struensee in 1770, when he was dismissed, and retired to Hamburg, where he died, February 18, 1772. He was created a count in 1767 by Christian VII,

whom he accompanied on his travels in 1768. The principal event of his ministry was the accommodation of the differences between Denmark and Russia on the subject of Holstein-Gottorp. In 1762 war was threatened by Peter III. of Russia, but his death having averted the immediate danger, a treaty was negotiated by Bernstorff, which was finally concluded in 1773, by which Russia resigned all pretensions to Holstein, and received in exchange Oldenburg. It was by Bernstorff's advice that Fredric V. purchased the property of the Danish West India Company, and opened the trade in 1754. The main object of his policy was the preservation of peace, in conjunction with which he directed all his efforts to the promotion of commerce and manufactures, and the encouragement of literature. He bears the character of an able and upright minister, and his exertions for the abolition of feudal slavery reflect the highest honour both on his wisdom and humanity.

*BERRY, CAROLINE-FERDINANDE LOUISE, DUCHESSE DE, the daughter of Ferdinand I., king of Naples and Sicily, was born at Naples November 5, 1798. She was married to the Duke de Berry (the second son of Charles X.), on the 17th of June, 1816. Her youth, her beauty, her southern temperament, re-animated the court, to which the grave and austere virtues of the Duchess of Angoulême had given a tone of gravity not popular in France. The Duchesse de Berry cultivated and patronised the arts, and devoted herself to the gaieties of the gay capital. Her present seemed all joy—her future all happiness. She had indeed by 1820 lost two children, but she had one daughter still. The Duke of Orleans, the elder brother of her husband, was dead; a throne was in immediate prospect. On Sunday, the 13th of February, on quitting the opera, her husband, while handing her to the carriage, was struck by the poniard of an assassin, and fell mortally wounded. On September 29, 1820, she gave birth to a son, who received at his birth the title of Duc de Bordeaux. During the three days of July 1830 the duchess displayed considerable courage and force of character; she desired to oppose the revolutionists by force, and offered to place herself in the midst of the troops, with her young son, to lead them on. She then accompanied Charles X. in his retreat at Holywood. The legitimist party were however active in France in favour of Henry V., as the Duc de Bordeaux was now named, and to support his claims organised plans for an insurrection in France. At length the duchess left Massa in Italy, whither she had accompanied her son, partly to be more uncontrolled in her projects, which were not approved of by Charles X. and the other members of his family, and landed on the night of August 28, 1832, a few leagues from Marseille. A movement was there attempted in her favour, but failed, and she hastened to La Vendée. She found friends in Brittany; they armed, and a civil war commenced. She was however betrayed by a converted Jew, who discovered the house at Nantes where she was secreted, in a hole behind a stove, only three feet and a half long by eighteen inches broad, and in which during the sixteen hours she had been shut up, her hands and her dress had been burned. She was confined in the castle of Blaye, but shortly afterwards she announced to the government of France that she had re-married. She was released in June 1833, and repaired with her husband, a son of the Prince of Lucchesi-Palli, to Sicily, in which retreat she still remains.

BERRY, CHARLES FERDINAND D'ARTOIS, DUC DE [CHARLES X.]

BERRY, JEAN, DUC DE, Count de Poitou, Macon, Auvergne, and Boulogne, the third son of John II., king of France, was born November 30, 1340. In 1356 he fought valiantly with his father at the battle of Poitiers, and was afterwards one of the hostages given to England by the treaty of Bretigny in 1360. He visited his domains on more than one occasion, and on the death of King John he ultimately recovered his freedom in 1367. In 1381 the Duc de Berry assisted at the coronation of Charles VI., who, unfortunately for his country, re-appointed him governor of Languedoc. He had been appointed first in 1359, but had behaved so tyrannically that he had been removed. He now redoubled his oppressions, and in 1384 broke out the bloody revolt of the Jacquerie. The hordes were crushed by the government, and the discontents suffocated in blood. Charles VI. however investigated the causes of this insurrection, some of the agents of the misgovernment were punished, and the duke was for a time deprived of his office. In 1407, as uncle to the dukes of Orleans and Burgundy, he endeavoured ineffectually to reconcile those ambitious princes; but on the assassination of the Duc de Orleans, he joined the party called Armagnacs against that of the Burgundians. He subsequently endeavoured to dissuade Henry V. from invading France, sending the archbishop of Bourges for that purpose. Previous to the battle of Agincourt he opposed himself to the plan of the French beginning the contest, remembering Poitiers, and advised delay. On June 15, 1416, he died in his Hotel de Neale at Paris.

The Duc de Berry has left a memory redeemed from general execration by his patronage of learning and the arts. At Bourges, at Poitiers, and at other places he erected or adorned some of the finest buildings of the age. In his hotels at Paris he formed a collection of manuscripts, which was the germ of the most important collection now

possessed by France, and which even now offers to the antiquarian an inexhaustible source of riches.

*BERRYER, ANTOINE PIERRE, is the eldest son of Pierre Nicolas, a celebrated French pleader and parliamentary advocate, who died in 1841. Antoine was born in Paris January 4, 1790. He was sent at an early age to the college of Juilly, where he by no means distinguished himself as a student. On leaving the college he evinced a strong desire to enter into holy orders, but his father opposed his wishes, and prevailed upon him to study for the bar. He accordingly went through the law course, acquainted himself with the practice by attendance for some months at an attorney's office, and made his début at the bar at the age of twenty-one. In 1815 the young councillor, who inherited legitimism from his father, entered himself as a royalist volunteer, and repaired to Ghent. After the return of the Bourbons however, believing that the restoration could never be rendered secure but by moderation and by mercy, he hesitated not to undertake the defence of those generals who had followed Bonaparte to Waterloo. He was associated with his father, and M. Dupin the elder, in the defence of Ney. Some days after he defended alone generals Debelle and Cambronne. For the last he obtained an acquittal, after one of his most eloquent addresses; General Debelle was found guilty, but Berryer threw himself at the feet of the king, and obtained his pardon: for Ney he could effect nothing. In his pleading for Cambronne however he had ventured to assert that "it was the duty of a general to obey the government de facto, and the man to whom the treaty of Fontainebleau had preserved the title and rights of a sovereign." For these sentiments he was cited before the Council of Advocates by the procureur-général, who asked only for a simple warning, which was pronounced.

This did not prevent M. Berryer's independent course. In 1816 he scrupled not to attack violently the measures of the minister of police, at that time M. Decazes, whom he accused of having been the true cause of the insurrections at Lyon and Grenoble. He was also a consistent supporter of the liberty of the press, and gave his aid as a barrister to journalists of all parties. He also defended the proscribed exiles of 1815, and was engaged in the processes against the bankers Séquin and Ouvrard. Indeed at this period of his life his professional business appears to have been immense.

One of the founders of the Société des Bonnes Lettres, he prepared himself in some degree for the parliamentary career he had resolved to enter upon by delivering a course of political lectures, which were remarkably well attended. Having attained the required age, in 1830 he was returned by a large majority by the electoral college of Puy, in the department of Haute-Loire. His first display was an attempt to convince the chamber that the monarch was not compelled to choose his ministry from the ranks of the majority, when a majority had voted against Polignac, who would not resign. The display was brilliant, but in vain. Charles X. acted as though he had been convinced by the orator, but the revolution of July triumphed alike over the reasoning of the lawyer and the obstinacy of the monarch.

After this event the royalist party left the two chambers in a mass. M. Berryer alone intrepidly undertook to remain there as the champion of the fallen cause. He took up a position between the majority—the adherents of the Orleans government—and the opposition party, composed of many shades of opinion. He allied himself with neither; he carefully watched both; exposing their errors or giving them the benefit of his advice. Thus on August 7 he denied the right of the chamber to give a new constitution to France; but being defeated on this point, he took an active part in the revision of the charter of 1814, and always in favour of the enlargement of political rights. He also supported at later periods the right of an appeal to a jury in cases of offence by the press; the reduction of the tax upon newspapers; the extension of municipal franchises; and the election of the maires by the electors of the various communes. When Casimir-Perier in 1831 was urging his restrictive laws against the press on the ground of supporting good order, M. Berryer exclaimed, "You have sapped the base of order—you have unchained anarchy; principles overpower you; you must submit to the consequences." In 1831 also he defended the hereditary rights of the peerage in conjunction with Thiers, Guizot, Roger-Collard, and others. The abolition was however carried by a large majority.

When the Duchesse de Berry landed in France in 1832 M. de Berryer, as the organ of the legitimists in Paris, quitted his parliamentary labours, and arrived in the neighbourhood of the gallant woman on May 22nd. His efforts to dissuade her from an appeal to arms having failed, he resolved to quit France for a time. At Angoulême, on his way to Switzerland, he was arrested, conveyed back to Nantes, and placed in prison. La Vendée was then under military law, and Berryer was to have been tried by a court-martial on June 4, when a decree of the Court of Cassation arrived, remitting to the civil tribunals the trials of the insurgents. Cited before the Court of Assise at Blois, Berryer was at once acquitted.

In 1833 Berryer made an appeal from the tribune in favour of the enlargement of the Duchesse de Berry; in the same year he successfully defended Chateaubriand before the Court of Assise of the Seine; and also several journals which had written in favour of the claims of Henry V. In 1834 the government, having demanded permission of the chamber to prosecute two of its members for libel, Berryer defended his two associates, claiming their immunity as one of the consequences

established by the revolution of 1830. Berryer, though doubtless sincere in his principles, in all his speeches shows much of the advocate's readiness to avail himself of any plea that may serve his present purpose; there is consequently a strange inconsistency in the line of argument pursued by him on different occasions. It is not necessary however to track his parliamentary career. In 1834 he vehemently opposed the stringent law proposed by the Duc de Broglie's cabinet against all associations. In 1838, when in consequence of the attack of Fieschi on the king fresh restrictions were imposed on the press, although there was no proof that the attempt of the one had been excited by the other, Berryer was again a determined antagonist to the measure. In this year also he opposed, as incomplete, vicious, and premature, the law for the abolition of slavery. After the capture of Louis Napoleon at Boulogne, Berryer was employed to plead for him, and made an energetic though unsuccessful defence. In December 1843 he visited England to offer his solemn recognition of the Duc de Bordeaux, then residing in Belgrave-square; for which act he was severely censured by M. de Guizot, and could make but a feeble defence. He would have withdrawn from the chamber, only he began to foresee the danger in which the throne of Louis Philippe stood, and thought by remaining he might hasten its fall. The revolution of February 1848 came; he was named representative for the department of Bouches-du-Rhône, and took an active part in the proceedings in favour of his own cause. But he felt that France was not prepared to receive Henry V. He visited him at Wiesbaden, and then declared that the "Count de Chambord had no power to enter France but with the title that adhered to him—the first Frenchman." When by the removal of General Changarnier from his command the executive had broken with the majority, Berryer joined Thiers and the other Orleanists in opposing the pretensions of the president, though he evinced less personality. On the 2nd of December 1851 he was one of the few constituents who met to protest against the coup-d'état, and spoke boldly and resolutely. Since then he has not appeared in public except professionally.

(*Nouvelle Biographie Universelle*; Long, *France and its Revolutions*.)

BERTHIER, LOUIS ALEXANDRE, Prince of Wagram, was born at Versailles on November 20, 1753, the son of an officer of engineers, who gave him a good military education. He entered the army, and served with Lafayette and Rochambeau in the American war. In 1789, when major-general of the national guards, he favoured the flight of the Aunts of Louis XVI. He served under Lukner during the insurrection in La Vendée, and in 1796 was appointed chief of a division of the army in Italy under Bonaparte, who then, as first consul, commanded there; and when Bonaparte left he took possession of Rome in satisfaction of the death of General Duphot, and proclaimed a republic: in this campaign he attached himself to Bonaparte, who made a confidant of him. On the 18th Brumaire (November 1799) Berthier was one of the generals who joined Bonaparte in putting an end to the Directory; and was rewarded afterwards with the post of secretary of war. When Bonaparte became emperor he was still further advanced: in rapid succession he was created *marchal*, grand huntsman, chief of the first cohort of the legion of honour, sovereign prince of Neufchâtel, and was married to a niece of the king of Bavaria. These were his rewards: his services were also numerous. Berthier was at the battle of Austerlitz, December 2, 1805, and was left in command of the army when Bonaparte quitted the camp for Munich. In the campaigns against Prussia and Russia, ending with the treaty of Tilait, Berthier took a part, but was not in a prominent position in any of the great battles. On the renewal of the war with Austria in 1809, Berthier was appointed commander-in-chief until Bonaparte himself arrived. After the battle of Wagram Berthier was created Prince of Wagram on the field for his distinguished services. In the campaigns of 1812, 1813, and 1814, he acted under Bonaparte's eye as general quarter-master and chief of the staff. For these situations he had admirable capabilities, which Napoleon knew and appreciated; though he deemed him wholly unfit to command in chief. After the fall of his great leader and friend, Berthier evinced but little gratitude. He resigned the principality of Neufchâtel, and repairing to Louis XVIII. at Compiègne, made his submission, and was rewarded by being created a peer of France, a marshal, and a captain of the royal body-guards. Bonaparte, though utterly selfish himself, could not credit this selfishness in Berthier. He wrote to him from Elba explaining his views. Berthier never answered: he could neither make up his mind to risk his present fortune in the bold adventure of his old master, nor could he be faithful to his new patron by showing him the letter. On Bonaparte's return in March 1815, he endeavoured to remain neuter, and took refuge in Bamberg with his father-in-law. Here, on the 1st of June 1815, it is said, six men in masks entered his chamber, and threw him out of the window; another statement is, that looking out of the window on some Russian troops, proceeding to attack France, he threw himself out. It is at least certain that he was found on the pavement, so crushed, that he died immediately. (*Conversations-Lexikon*; *Nouvelle Biographie Universelle*.)

BERTHOLLET, CLAUDE LOUIS, a distinguished chemical philosopher, was born at Talloire, near Annecy in Savoy, on the 9th of December 1748. He commenced his studies at Chambéry, and completed them at the College des Provinces at Turin, an establishment in which many eminent persons have been educated. Having obtained

a medical degree, he soon afterwards went to Paris, where he continued chiefly to reside during the remainder of a long life devoted to the acquisition of knowledge.

Berthollet became acquainted at Paris with M. Tronchin, a medical practitioner of eminence and a native of Geneva, and through him obtained the appointment of physician to the Duke of Orleans; in this situation he studied chemistry with great assiduity and success, and soon made himself advantageously known by his 'Essays' on the subject. In 1781 he was elected a member of the Academy of Sciences; and a few years afterwards the Duke of Orleans procured for him the situation of government commissary and superintendent of dyeing processes, which had been occupied by Macquer. To this appointment chemistry was indebted for his work on dyeing, which contains a better account both of the theory and practice of the art than any which had before made its appearance.

At a meeting of the Academy of Sciences in 1785, Berthollet announced his belief in the antiphlogistic doctrines recently propounded by Lavoisier, and he was the first French chemist of any celebrity who did so. On one subject he, indeed, differed from this illustrious chemist, for he did not admit oxygen to be the acidifying principle; and the justness of Berthollet's views is now universally admitted. In this year he completed the discovery of the composition of ammonia, by following out the previous experiments of Priestley. He also published his first essay on dephlogisticated marine acid, now called chlorine, and proposed the use of it in the process of bleaching; an application which has been most extensively and beneficially adopted.

When the French revolution broke out, and France became involved in war, it was found necessary to obtain, if possible within the limits of the French territories, many of the requisites for carrying on war, which had previously been imported. Berthollet accordingly visited almost every part of the country, for the purpose of pointing out the means of extracting and purifying saltpetre to be used in the manufacture of gunpowder; he was also employed with other men of science in teaching the processes of smelting iron and converting it into steel. In the year 1792, being appointed one of the commissioners of the Mint, he introduced considerable improvements into the processes employed in it. In 1794 he was made a member of the commission of agriculture and arts, and professor of chemistry at the Polytechnic and Normal Schools.

When the Institute was organised in 1795, he became an active member of it, and in the following year he was appointed by the Directory to proceed, in company with Monge, to Italy, in order to select works of science and art to be sent to the French capital. On this occasion he became acquainted with Bonaparte, which led to his joining the expedition to Egypt, and the subsequent formation of the Institute of Cairo, the memoirs of which body were printed in one volume at Paris in the year 1800.

Berthollet in conjunction with Lavoisier, Guyton de Morveau, and Fourcroy, planned and proposed a new and philosophical chemical nomenclature. This, even with all the errors and omissions necessarily attendant upon so new an attempt, has been of essential service to chemical science, and reflects much honour upon its authors. Berthollet was the author of more than eighty memoirs, some of the earlier of which were inserted in the memoirs of the Academy; his later memoirs are generally printed in the 'Annales de Chimie,' 'Journal de Physique,' and the 'Mémoires de Physique et de Chimie de la Société d'Arcueil,' so called from the place in which Berthollet lived, at whose house the sittings were held.

Some of the first memoirs which he published were on sulphurous acid, on the volatile alkali, and the decomposition of nitre; in these he adopted, and for some time strenuously defended, the phlogistic theory. In a paper on soaps, he showed that they are chemical compounds, in which the oil, by combining with the alkali, acts the part of an acid. In 1785, following and extending the experiments of Priestley, he proved that ammonia is a compound of three volumes of hydrogen gas, and one volume of azotic gas. About the same time he read a paper on the dephlogisticated marine acid, as it was called by Scheele its discoverer, on which occasion he renounced the doctrine of phlogiston; in his experiments on this supposed acid he found that water impregnated with it, when exposed to light, lost its green tint, gave out oxygen gas, and became common marine acid. This experiment seemed satisfactorily to prove, that dephlogisticated marine acid was composed of oxygen and muriatic, then called marine acid; Berthollet accordingly gave it the name of oxygenised muriatic acid, shortened by Kirwan into oxymuriatic acid. In this experiment however the agency of water was not taken into the account, and the incorrectness of Berthollet's opinion has been fully demonstrated by the experiments of Davy, Gay-Lussac, and Thenard; the name of chlorine is now given to this body. In his essay on sulphuretted hydrogen, in 1778, he showed that this gas, though containing no oxygen, possessed acid properties; and in 1787, in an essay on prussic acid, he further proved the same fact, determining, by an analysis attended with great difficulties, that this acid contained no oxygen, and consequently exhibited an additional proof that oxygen was not, as Lavoisier had supposed, the acidifying principle.

Berthollet was also the discoverer of the ammoniuret of silver, generally called fulminating silver; and he first obtained hydrate of

potash in a state of purity, by dissolving it in alcohol. His experiments on the sulphurets and hydro-sulphurets contributed to elucidate an obscure part of chemistry, but they were not complete, because the nature of the fixed alkalies, then unknown, is involved in the question.

In 1803 Berthollet published his work entitled 'Essai de Statique Chimique,' in which he opposes the views of Bergman on the subject of chemical affinity. Although Berthollet's experiments, in some degree, modify the conclusions of Bergman, they by no means disprove them; and his opinions, though supported with great ingenuity, both of reasoning and experiment, have not made many converts. Sir H. Davy, in his 'Elements of Chemical Philosophy,' p. 117, has given an excellent synopsis of the peculiar views of Berthollet, and has clearly shown that his reasonings are unsupported, except by facts which are better explained on different principles.

In a controversy which Berthollet had with Proust, he maintained an opinion which now seems too extraordinary ever to have been broached, that bodies are capable of combining in all proportions. The discussion was carried on with great vigour but equal courtesy on both sides, and though the ingenuity with which Berthollet sustained his views was greater than most persons could have brought to their support, it is now universally admitted that his ideas were totally inaccurate, while those of Proust have acquired fresh proof from the doctrine of definite proportions.

Upon his return from Egypt, Berthollet was nominated a senator by the First Consul; and afterwards received the distinction of grand officer of the Legion of Honour, grand cross of the order of Re-union, and under the Emperor he was created Count; after the restoration of the Bourbon he was created a peer of France. The advancement to these offices produced no change in the manners of Berthollet. Of this he gave a striking proof, by adopting, as his armorial bearing (at the time that others eagerly blazoned some exploit), the plain unadorned figure of his faithful and affectionate dog. He was no courtier before he received these honours, and he remained equally simple and unassuming, and not less devoted to science, after they were conferred.

The latter years of his life were embittered by the misconduct and suicide of his son, M. Amodée Berthollet, who had distinguished himself by his chemical researches. In 1822 he was attacked by a slight fever, which left behind it a number of boils: these were soon followed by a gangrenous ulcer of uncommon size. Under this he suffered for several months with surprising fortitude. He himself, as a physician, knew the extent of his danger, felt the inevitable progress of the malady, and calmly regarded the slow approach of death. At length, after a tedious period of suffering, in which his equanimity had never once been shaken, he died on the 6th of November, when he had nearly completed the seventy-fourth year of his age.

BERVIC, CHARLES CLEMENT BALVAY, the most distinguished engraver of France during the French revolution, was born at Paris in 1756. He was the pupil of J. G. Wille, and in 1784 was elected a member of the French academy of painting. A large full-length portrait of Louis XVI. which he engraved in 1790, from the picture by Callet, is one of the finest engravings of the kind that has been produced. It is distinguished for excellent drawing, extreme softness of tone, and a true effect of colour, but is rather defective in force. After the execution of the king, Bervic, wishing to escape suspicion, and at the same time preserve the plate, cut it in half, thus attaining both objects. The half plates were reunited after the restoration, and excellent impressions were again taken from it; but the earlier impressions are much more valued, and command very high prices. Müller of Stuttgart engraved the same picture. Other masterpieces of Bervic's graver are the Rape of Deianira, and the Education of Achilles, after Guido and Regnault; La Demande Acceptée, and Le Repos, after Lépicié; and the ancient group of the Laocoon. The state of his health obliged him some years before his death to give up the practice of engraving, and he confined himself to teaching the art. He died in 1822. He was a member of the French Institute, and Chevalier of the order of St. Michel, of the Légion d'Honneur, and of the Réunion. (Huber, *Manuel des Amateurs*, &c.; Bartsch, *Peintre-Graveur*; Joubert, *Manuel de l'Amateur d'Antiques*; Gabet, *Dictionnaire des Artistes*, &c.)

BERWICK, JAMES FITZJAMES, DUKE OF, a natural son of James, duke of York, afterwards James II. of England, by Arabella Churchill, sister of the great duke of Marlborough, was born at Moulins in the Bourbonnois, August 21, 1670. He was educated in France, and in 1696 served in the Austrian army at the siege of Budá. In 1697 he was created Duke of Berwick, and received the order of the garter. Having returned to England after the campaign of 1697, he received several important military appointments.

On the breaking out of the revolution of 1688, the Duke of Berwick exerted himself to check its progress, and afterwards accompanied the king on his retirement to France. In 1689 he served in the expedition to Ireland, undertaken for the restoration of James II., whence he returned to France in 1691. Having entered the French service, he was promoted to the rank of lieutenant-general in 1693. In 1696 he was sent to England to negotiate with the Jacobite party in England, but speedily returned without success. In 1703 he was naturalised as a subject of France; and in the beginning of the following year was appointed to the command of the French forces in Spain. After having

essentially served the cause of Philip V. by his military skill, he was recalled through court intrigue at the end of the campaign of 1704. In the beginning of 1706 he was made a marshal of France, and was again sent to command in Spain, where in 1707 he won the decisive battle of Almanza, against the Earl of Galway and the Marquis de las Minas, immediately after which Philip V. created him a grandee of the first class, by the title of Duke of Liria and Xerica. Having served on the Rhine and in Flanders in 1708, he was sent in 1709 to command in Provence and Dauphiny; his successful defence of this frontier against the superior force of the Duke of Savoy, is the chief foundation of his military fame, and has been considered a masterpiece of strategy. During the remainder of his life he was constantly employed in important commands, with the exception of the period from 1724 to 1733, during which he lived in retirement. He was killed by a cannon ball at the siege of Philippsburg, June 12, 1734.

The Duke of Berwick was twice married; first in 1695, to a daughter of the Earl of Clanricarde, who died in 1698. By her he had one son, who succeeded to his titles and estates in Spain. His second wife was a niece of Lord Bulkeley. In 1709 he was created a duke and peer of France, with remainder to his children by her. In military reputation, particularly for the conduct of defensive war, the Duke of Berwick stands high among the generals of his period. Both his public and private character are represented by Montesquieu as deserving of the highest panegyric. His memoirs down to the year 1716, written by himself, with a continuation to his death by the editor, and a sketch of his character by Montesquieu, were published at Paris in 1778.

BERZELIUS (or BERZEL), JÖNS JACOB, one of the most distinguished of modern chemists, was born August 20th 1779 at Wätersunda, a village near Linköping, in East Gothland. Beyond the fact that he received the elements of learning from his father, who was parish schoolmaster—a functionary of some consideration in Sweden—and who died while his son was yet a boy, we know nothing of his early years. At the age of seventeen the youth entered on the study of medicine at the university of Upsal, and attended the dull lectures on chemistry delivered by Afzelius and Ekeberg. So little care was at that time taken to render scientific instruction clear to the mind, that Berzelius had to discover and investigate facts and draw conclusions for himself, and soon became remarkable for his diligence and discernment. As an instance of the way in which he was initiated into chemical manipulation, he used laughingly to relate in after life:—"Afzelius first gave me sulphate of iron to calcine in a crucible, for the preparation of colcothar. 'Any one may do work of this kind,' I replied; 'and if this be the way you are to teach me, I may as well stay at home.' 'A little patience,' answered the professor, 'your next preparation shall be more difficult.' On the next occasion I got cream of tartar to burn, in order to make potass; which so disgusted me, that I vowed never to ask for any further employment." But he continued to attend notwithstanding his vow, and soon frequented the laboratory every day, although by the rules pupils were entitled to admission but once a week, his masters offering no opposition. Ekeberg was however vexed at times that the young student pursued his tasks in silence, asking no questions. "I preferred," said Berzelius, "to endeavour to instruct myself by reading, meditating, and experimenting, rather than question men without experience, who gave me replies, if not evasive, at least very little satisfactory on the subject of phenomena which they had never observed."

In 1798, after two years' study, he left Upsal, and engaged himself as assistant to the physician-superintendent of the mineral springs at Medevi, a watering-place much resorted to by the Swedes. Here with his habitual diligence he analysed the waters, and in conjunction with Ekeberg published a paper embodying the results. This was the first of the long series of papers that remain to illustrate his fame.

In 1804 Berzelius returned to Upsal, and took his degree of Doctor in Medicine; and soon after published his 'Physical Researches on the Effects of Galvanism on Organised Bodies,' a work which exhibits much of his sagacious insight and painstaking. Davy, who was born in the same year with the illustrious Swede, had made known his experiments; and Berzelius, taking up the subject, then a wonder to scientific men, materially widened his applications. His growing reputation gained for him, on his going to reside at Stockholm in 1805, the post of assistant to Sparrmann, professor of medicine and botany, who had sailed as naturalist in Cook's second voyage of discovery. The emoluments were so scanty that Berzelius had at times to practise medicine to eke out his resources. In 1806 he succeeded to the chair, and in the same year, jointly with Hisinger, he commenced the 'Afhandlingar i Fysik, Kemi, och Mineralogie,' to which, during the twelve years of its existence, he contributed forty-seven original papers. This periodical was at once translated into German, and subsequently into French, and generally prized for its trustworthy elucidation of chemical principles. This however was but a small part of what Berzelius undertook: he set to work to revise the labours of his predecessors, accepting no conclusion that did not admit of the clearest demonstration. His skill as an analyst is described as "consummate," and when Dalton and Davy put forth their views he, by innumerable analyses, established the laws which regulate chemical combinations, and reduced them to a form so simple as to give them a twofold value. "When these laws were once well ascertained," says an eminent foreign savant, "it became

possible to control the results of analyses—even to foresee a great number of combinations then unknown—and to carry into every operation an accuracy previously thought altogether unattainable.”

By his elaborate examination, beginning with the salts and going through the whole range of elements, including the products of organised existence, Berzelius anticipated Dalton in some of his conclusions, and afterwards found a perfect agreement between his results and those of the Manchester philosopher. His knowledge of the laws of definite combinations enabled him to elucidate the nature of minerals, and to show at the same time, by the composition of the minerals, the universality of the laws. He helped indeed to bring the atomic theory to perfection, and to introduce it into science. He framed moreover an electro-chemical theory, and published ‘Lectures on Animal Chemistry,’ a work filled with rare proofs of original research and clear perceptions on a branch of science then least understood. On the publication of these lectures the Swedish government made him a grant of two hundred dollars a year, to enable him the better to prosecute his labours. In 1807 he joined with seven leading members of the profession in establishing the Medical Society of Sweden, now a flourishing institution; and in the following year he was admitted a member of the Royal Academy of Sciences of Stockholm. In 1810, being then at the age of thirty-one, he was elected President of the Academy—a striking proof of the estimation in which he was held by his colleagues.

Berzelius visited England in 1812, and while here learned how prelections could be made really interesting as well as instructive by attending Dr. Marcet's lectures at Guy's Hospital. In conjunction with Dr. Marcet he wrote a paper entitled ‘Experiments on the Alcohol of Sulphur, or Sulphuret of Carbon,’ which was published in the ‘Philosophical Transactions’ for 1813; and in the same year he was elected a foreign member of the Royal Society.

On his return to Stockholm Berzelius at once changed his style of lecturing, and with the happiest results. His dry readings became living discourses, illustrated by experiments, of which he greatly multiplied the number suitable for public exhibition by his quick imagination. Men whose names have since become famous attended his teachings. In 1815 he was made Chevalier, and afterwards Commander of the order of Wasa; and in 1818 he was chosen perpetual Secretary of the Academy, which distinguished post he held for the rest of his life. In the same year, at the coronation of Charles-John, he was ennobled with permission, contrary to custom, to retain his name. In 1821, at the instance of the Academy, he commenced that series of annual reports on the progress of chemistry and physics, which, while contributing materially to the advancement of those sciences, confirmed and heightened his own reputation. Speculative philosophers charged him with jealousy and envy, because of his intolerance of unsubstantial theories. No theory was ever accepted or started by him that was not supported by a solid basis of facts. If “too cautious,” as was often said, he studied but the interests of science; and if jealous, it was for chemistry, and not for himself. Regarding himself as a vidette ever on duty, he warned and alarmed whenever the occasion required, and confident in integrity, delivered his opinions with unqualified freedom. So faithful a censor will not be easily replaced.

In the hands of Berzelius the blowpipe became a most important instrument in the analysis of inorganic substances. A translation of his treatise on the subject appeared in English in 1822—‘On the Use of the Blowpipe in Chemical Analysis, and the examination of Minerals.’ There was scarcely a question that he did not bring to the test of experiment, and reduce to its proper place in science, as may be seen in his great work ‘Lehrbuch der Chemie,’ which has gone through five editions, and as many translations. The last was published at Paris in six volumes octavo in 1845-50.

In 1832 Berzelius resigned the professorship which he had held for twenty-six years; but still kept on with his scientific labours. He married about this time, and on the day of his wedding the king wrote to confer on him the dignity of ‘Freiherr,’ or Baron, observing that, “Sweden and the world were the debtors of a man whose entire life had been devoted to works as useful to all, as they were glorious to his native country.” Subsequently he had the further honour of receiving the Grand Cross of the Royal Swedish order of the Polar Star. The directors of the Swedish iron-works awarded him a pension in acknowledgment of his eminent services to their branch of industry. And in 1836 the Royal Society of London showed their sense of his merits by giving him their Copley Medal.

So the life of Berzelius flowed on in a tranquil current. He enjoyed all the honours his native land could give, had the satisfaction of seeing his name enrolled among the members of nearly all the scientific societies of the world, more than 100, and of knowing that foreign governments recognised his worth. As he approached the age of fifty his sight began to fail, and his memory to lose somewhat of its power. Infirmities now increased on the philosopher, whose health had never been robust. He was seized with paralysis of the lower extremities; but retained the serenity of his mind till death approaching, as one has said, “with slow steps, as a messenger who regretted his errand,” closed his career on the 1st of August, 1848. His death was felt as a national calamity, and the scientific societies of his native land wore mourning for two months in respect for his memory.

BESSA'RION, JOHN, was born at Trebizond, on the south-east coast of the Euxine, in 1389, or, according to Bandini, who has written his life (4to, Rome, 1777), in 1395. Having removed to Constantinople he devoted himself to study under George Chrysoococes and other eminent teachers, and while yet quite young entered the strict monastic order of St. Basil. He passed twenty-one years in a monastery in the Peloponnesus, where he studied under the philosopher George Gemistus Pletho, from whom he acquired that admiration for Plato which he retained to the end of his life. In 1433 was held the council of Ferrara, for the purpose of effecting a union between the Greek and Latin churches, and so great was the reputation of Bessarion for learning and talent, that he was selected by the emperor John Palaeologus to accompany him as one of the conductors of the conference on the part of the Greeks, and before he set out was raised to the dignity of archbishop of Nicaea. Both at Ferrara and after the council had, on account of the plague, been removed to Florence, Bessarion earnestly exerted himself in promoting the union, which was agreed to in the year 1439. After the close of the council he returned to Constantinople, but finding himself an object of popular enmity on account of his conduct at Ferrara and Florence, and having in the end of the same year been raised to the cardinalate by Eugenius IV., he settled in Italy. Here he devoted himself to study, the patronage of learned men, and the collecting of books and manuscripts, which he afterwards, in the year 1463, presented to the Venetian senate, and which formed the basis of the celebrated library of St. Mark. Pope Nicholas V. conferred on him the archbishopric of Siponto. In 1449 that pontiff created him cardinal bishop of Sabina, and in the same year translated him to the see of Tusculum or Frascati. In 1463 Pius II. conferred on him the empty title of Patriarch of Constantinople.

In the reign of Nicholas V. Bessarion held for five years the office of legate at Bologna, the duties of which he discharged with much applause. He was also employed on several embassies, the last of which, undertaken for the purpose of reconciling Louis XI. of France and the Duke of Burgundy, is said to have occasioned his death through vexation at the insulting behaviour of the King of France. On his way back to Rome he died at Ravenna in 1472. His works on various subjects are numerous; some of them have been published, others exist only in manuscript. The most celebrated are his Latin translation of the ‘Memorabilia of Xenophon;’ that of the ‘Metaphysics of Aristotle;’ and his treatise ‘Contra Calumniatorem Platonis,’ first published in 1469. This is a controversial tract written against George of Trebizond, who had endeavoured to exalt Aristotle by deifying Plato.

BESSEL, FRIEDRICH WILHELM, was born at Minden on the 22nd of July 1784. His father was a civil officer (justizrath) under the Prussian government; his mother a clergyman's daughter; and there being a family of nine children to rear on but narrow means, the future astronomer received only an ordinary education. Among his earliest manifestations was a dislike of classical literature, and a love for arithmetic. His quickness in calculation led to his being articled at the age of fifteen as clerk in a mercantile house at Bremen. Here he showed himself diligent to fulfil the duty that lay immediately before him, whatever it might be; and this remained his especial characteristic. The hope of being offered the post of surcargo on a foreign voyage was then his stimulus; and to qualify himself for the responsible office he began to study French and Spanish, and Hamilton Moore's old work on navigation. Dissatisfied with the rules and processes laid down for nautical reckoning, he sought for better information in a popular treatise on astronomy, and finding therein the means for overcoming his difficulties, he pursued the study with eagerness, till ignorance of mathematics brought him to a stand. Regarding the check as a call for greater exertions, he betook himself to a course of mathematical reading, and so interested did he become in this new study, that all his spare hours, chiefly in the night, were devoted to it. There was no longer the same charm in commercial pursuits, or in the hope of a voyage. And now appeared a trait that marked his character through life—turning theory or knowledge to positive and practical uses. With a rude wooden sextant, made by a carpenter, and a common clock, he began to make time-observations; and having observed the occultation of a star by the moon, he got therefrom, to his great joy, an approximate latitude of Bremen. This was one of the successes that gladden the heart of the student, repay his toil, and animate him to renewed exertions.

From this time his progress in astronomical studies was surprisingly rapid. While still a clerk in a counting-house, he had formed designs of original inquiry, such as are expected only from veterans of science. Harriott's and Terporley's rough observations of the comet of 1607 had been found by Baron Zach, while searching the collection of Harriott's papers in the possession of the Earl of Egremont, and these being the first instrumental observations of that comet—since known as Halley's—their reduction was a desideratum of first-rate importance. Bessel, when in his 20th year, undertook the task, and executed it in so masterly a manner that Olbers, to whom he communicated the results, foreseeing his future eminence, praised him in the warmest terms, and sought to enlist him in the astronomical ranks. The reductions—Bessel's first published work—appeared in Zach's ‘Monatliche Correspondenz,’ and was speedily followed by a

theoretical paper of great merit, 'On the Calculation of the True Anomaly in Orbits nearly Parabolic,' the beginning of a long series of contributions to the German scientific periodicals. "So expert had he become in cometic calculations," says one of his biographers, "that Olbers, having placed in his hands, on the night of the 1st of November 1805, four observations of the comet of that year, he returned them to him the next morning, with the elements, whose calculation had occupied him only four hours."

Bessel faithfully served his term of seven years; but no sooner was he free than, abandoning all pursuit of a commercial life, he, recommended by Olbers, succeeded Harding as assistant to Schröter at Lilienthal in 1806. He was now an astronomer to all intents and purposes; and well did he justify the anticipations of his friends. Not many years elapsed before his name stood among the foremost of modern astronomers.

One of his first tasks at Lilienthal was a series of observations on the sixth, or Huyghenian satellite of Saturn, with a view to determine the mass of the planet and ring, on which he wrote an able and elaborate paper (published in the 'Königsberger Archiv für Naturwissenschaften'), discussing all the phenomena of attraction and the disturbing causes. It formed a subject for examination in after years, when more perfect instruments were available. He observed also the comet of 1807, by which, on the publication of the elements with an examination of the perturbations, in 1810, he gained the Lalande prize of the Academy of Sciences at Paris.

Bessel was one who cared little for accumulating observations without getting from them some direct practical result. He says of himself, in the preface to his 'Untersuchungen,' "that he at no time felt any especial predilection for one rather than another particular branch of astronomical occupation; but that one idea was continually present to his mind—that of always working up to an immediate and definite object." He held, that an observer who "failed to deduce actual results from observations, with a distinct view to the improvement of knowledge," neglected an essential condition of success and usefulness; and his whole life exemplified his conviction.

The king of Prussia having resolved to establish an observatory at Königsberg, Bessel was appointed director in 1810, and removing thither, he superintended the building and the mounting of the instruments, fulfilling at the same time the associated duties of professor of astronomy and mathematics in the university. The establishment, which was finished in 1813, remains no less a monument of his skill and earnestness than of the munificence that founded it amid the distractions of war. Observations were published in the same year, and have been continued ever since with incalculable benefit to practical astronomers.

Settled in a congenial home, Bessel married. His wife was daughter of Professor Hagen: he had by her one son and two daughters. And now, what he had done for the comet observations of 1807, he—also at Olbers' suggestion—undertook for Bradley's Greenwich observations, which, first published in 1805, had been but little regarded by the astronomers of the day. He had begun the task of digestion and reduction in 1807, and applying himself to it as his numerous avocations admitted, brought it to a close in 1818. The results of this long-continued labour have been for many years before the world in a folio volume, entitled 'Fundamenta Astronomiæ.' This work, published when the author was in his thirty-fourth year, is of such a nature that even grave philosophers can scarcely speak of it in sober terms; and it is especially interesting to Englishmen, being based on the twelve years' observations of Bradley. The book indeed cannot be over-praised. In the words of a scientific report—"Besides elaborate determinations of all the principal elements of the reduction, the errors of the instruments, the height of the pole, refraction, parallax, aberration, precession, proper motion, it contains a catalogue of the mean places of 3222 fixed stars, observed between 1750 and 1762 with the best instruments in existence at that time, and reduced to the epoch of 1755, with a precision and accuracy of which there was no previous example. It now furnishes astronomers with the best existing means of determining all those data which can only be deduced from a comparison of observations made at considerably distant intervals of time, and may be considered in fact as having laid the foundations of the principal improvements which have been made in astronomy since the date of its publication." Schumacher's noteworthy remark, "One may almost assert that one exact and able calculator is capable of doing better service to astronomical science than two new observatories," in this case found its verification.

Bessel's reputation was established. In 1822 he was elected a foreign member of the Astronomical Society of London, and three years later of the Royal Society; and the scientific societies on the continent hastened to enrol him among their associates. The king of Denmark conferred on him the order of the Dannebrog; and from his own sovereign, who through life was his steady friend, he received the order of the Civil Merit and of the Red Eagle, with the title of Privy Councillor; and the Berlin Academy awarded him their prize for his paper on the precession of the equinoxes.

Bessel's labours have been so numerous that anything more than a bare enumeration of them is scarcely possible. He improved the method of finding longitudes. He determined the length of the seconds' pendulum at his own observatory, and so perfectly, as to establish an

epoch in the history of pendulum experiments. He showed that in all former observations an essential cause of error had been overlooked, namely, the mass of air dragged by the pendulum in its oscillations; and that the amount of consequent disturbance would have to be calculated for every pendulum. He investigated all possible causes of error in astronomical instruments, leaving nothing unaccounted for, till he surpassed all his contemporaries in his knowledge of the theory of instruments. He was employed to determine the Prussian standard of length; and in connecting the geodetical surveys of Russia with those of Prussia, and of the west and south of Europe; and displayed in these, as in his other labours, rare ingenuity in devising new methods and avoiding causes of error. At the same time he measured an arc of the meridian of his own observatory. Then, as was his habit, taking the whole subject into view, he investigated the surveys of the British government in India and elsewhere, and of the French from the Belgian frontier to the Mediterranean, shrinking from no toil that might aid in the accomplishment of his object. An error made in the French triangulation had been calculated and allowed for by four independent geometers, but Bessel, not satisfied with this, "actually recalculated the whole of the work by his own method, producing a result agreeing with the mean of the four determinations alluded to within a fraction of a toise." In 1837 he began and carried on for three years a series of observations on the star 61 Cygni, to determine if possible the annual parallax of a fixed star—a task which had been the opprobrium of science. Thanks to his marvellous skill and delicacy of perception, he ascertained the fact; and though the amount of parallax is almost inconceivably small, only 31-100ths of a second, astronomers agree in considering it as demonstrated. By observations of other fixed stars, Sirius and Procyon, he "thought himself authorised to announce the want of uniformity in their proper motions as a positive astronomical fact." And he threw out a speculation as to the cause, namely, that the stars in question are double stars, of which one is not luminous: hence we see the disturbances, but not the disturber.

A more trustworthy guide than Bessel could not be followed: to his example the present excellence of astronomical science in Germany is due. He was a copious writer; the more remarkable, as his writings exhibit proofs of as much profound research, as of variety of attainments. His 'Tabula Regiomontana,' which may be regarded as a supplement to the 'Fundamenta,' &c., appeared in 1830. Nearly two hundred papers, neither short nor unimportant, in the 'Astronomische Nachrichten,' bear his signature; and others are to be found in the 'Abhandlungen der Berlin Academy,' and in scientific journals, some of which are named above. He published also two volumes of 'Astronomische Untersuchungen,' and, as is said, left a third in preparation.

Bessel visited England in 1812, and was received and honoured in a way accordant with his desert. There is reason to believe that on his return he intended to investigate the problem which, in the hands of Adams and Le Verrier, led to the discovery of Neptune. The preliminary reductions were made: but grief over the loss of his son, a young man of great promise, who died in 1811, and the approaches of disease of a very painful nature upon the astronomer himself, stayed his inquiring spirit. His sufferings became severe, caused by a fungous growth in the abdomen: he died on the 7th March 1846, at the age of sixty-two.

BESSIÈRES, JEAN-BAPTISTE, was born at Preissac, near Cahors, in the department of Lot, on August 6, 1768. In 1792 he served for a few months in the constitutional guard; and on the disbanding of this body, in November of the same year, he entered as a private in a cavalry regiment. His valour secured his promotion step by step, during his service with the army of the Moselle. Passing into the army of Italy he attracted the favourable notice of Bonaparte. At the battle of Roveredo, September 4, 1796, he so distinguished himself that he was appointed a lieutenant-colonel on the field. Created brigadier-general in 1798, he took part in the campaign in Egypt. On his return to France with Bonaparte, he was comprised in the new organisation of the army of Italy; and receiving a command of cavalry, made the last determined charge which decided the battle of Marengo. On July 18, 1800, he became general of brigade, in 1802 general of division, and in 1804 marshal, and chief of the third cohort of the legion of honour. In the war with Austria in 1805, Bessières marched to Vienna with the imperial guard, and by a skillful attack defeated Kutusoff with 6000 Russians, at Olmütz, in November. At the battle of Austerlitz also he contributed greatly to the success of the day. At Jena, at Friedland, and at Eylau he showed equal skill.

The scene of his operations was then changed. In 1808 he was sent to command in Spain a division of 18,000 men, which occupied the province of Salamanca. On arriving he found that General Cuerta had posted himself between Valladolid and Burgos, so as to cut off the communication of Madrid with France. The danger was imminent, and he ordered an instant attack. After six hours of severe conflict, the Spaniards were defeated, with a loss of 900 killed, 6000 prisoners, their artillery, and camp equipage. After this victory Napoleon exclaimed that Bessières had placed his brother on the throne of Spain. On December 4, he was at the capture of Madrid, and then followed the routed remains of the army of Castanos. For these services he was created Duke of Istria in May 1809; and then

proceeded to the grand army in Germany to take the command of a cavalry division, at the head of which, at the battle of Esslingen, on July 6, he overthrew the division of the Austrian general Hohenzollern.

In the expedition to Russia, Bessières was chief commander of the cavalry of the guard. On the opening of the campaign in Germany in 1813, he received the command of the whole of the French cavalry. On the morning before the battle of Lützen he was desirous of reconnoitring the field from the defile of Rippach. He was on foot, and advanced by the side of the skirmishers, with his usual bravery; the enemy began to withdraw, when a bullet pierced his breast, and at once put an end to his life. His death was not made known at first, in order not to dispirit the army.

(*Conversations-Lexikon; Biographie Universelle.*)

BETHAM, SIR WILLIAM, was born in 1779 at Stradbroke in Suffolk. His father was the Rev. William Betham, author of 'Genealogical Tables of the Sovereigns of the World,' folio, 1795, and of a 'Baronetage,' in 5 vols. 4to, published in 1801-5. Although young Betham appears to have inherited his father's tastes, he had to carve out his own career, having been placed by his father as apprentice to a printer in London. His first literary employment was in the revision of the 3rd and 4th volumes of Gough's edition of Camden's 'Britannia.'

In 1805 he went to Dublin as clerk to Sir Charles Fortescue, Ulster king of arms. A few years later he became the deputy of Sir Charles; and he succeeded him as Ulster king of arms in 1820. Mr. Betham was appointed Genealogist of the Order of St. Patrick in July 1812, on which occasion he was knighted. He also received the appointment of Deputy Keeper of Records at Dublin, an office in itself of little emolument, but which placed under his control a large number of records, of which he availed himself to form an immense collection of historical and genealogical references, extending to several hundred volumes, which has since served as an invaluable store-house in family, historical, and legal inquiries. Sir William also formed an index to the names of all persons mentioned in the wills deposited at the Prerogative Office, Dublin, a task which occupied a considerable portion of his time from 1807 to 1823, and extended to 40 large folio volumes. Sir William was likewise a diligent collector of old manuscripts connected with Irish history and antiquities: his collection was purchased by the Irish Academy in 1851.

Sir William Betham was elected in 1825 a member of the Irish Academy, and soon after became its foreign secretary, which office he held till 1840, when he resigned it in consequence of the council refusing admission in the 'Transactions' of the society to some of his philological speculations. He was a zealous but credulous antiquary, and some of his archaeological and philological speculations were of a very singular but wholly untenable character. For a long series of years he devoted himself to the investigation of primeval Irish, or rather Celtic, antiquities, and he fancied that he had discovered traces of the connection of the Celtic races with several of the most remarkable nations of antiquity. His first separate antiquarian publication, 'Irish Antiquarian Researches, or Illustrations of Irish History,' 1826-27, contains many of his peculiar views; but they are more fully developed in his two principal works of this class, the titles of which will sufficiently indicate the character of his notions: the first of these was entitled 'The Gael and Cimbri; or an Inquiry into the Origin and History of the Irish, Scots, Britains, and Gauls, and of the Caledonians, Picts, Welsh, Cornish, and Bretons,' 8vo, 1834; but the full expansion of his opinions was not arrived at till some eight years later, when appeared his 'Etruria Celtica, Etruscan Literature and Antiquities Investigated; or the Language of that People compared and identified with the Ibero-Celtic, and both shown to be Phœnician,' 2 vols. 8vo, 1842. He also contributed numerous papers on Irish antiquities to the 'Transactions of the Irish Academy,' which have their value unfortunately greatly lessened by his strange want of critical discernment. Sir William was elected a Fellow of the Society of Antiquaries, London, in 1825, but only two or three papers by him were printed in the 'Archæologia.'

In his own proper line of research Sir William was a far more trustworthy guide. Besides several genealogical memoirs, and a valuable work on 'Parliamentary and Feudal Dignities,' Sir William published in 1834 an able and learned treatise on 'The Origin and History of the Constitution of England, and of the Early Parliaments of Ireland.'

For many years before his death Sir William occupied a prominent place in the general and literary society of Dublin; and he was looked up to as a leader in most of the religious and charitable as well as the literary and scientific movements in the Irish metropolis. Kindly and courteous to all who sought his advice or assistance, and always ready to place his stores at the service of the historical or antiquarian inquirer, his death, though at a ripe old age, was generally regretted. He died at Dublin, October 23, 1853, aged seventy-four.

(*Gentleman's Magazine*, 1853.)

BETHLEN-GABOR, prince of Transylvania, and king of Hungary, was born about 1580. He was the descendant of a noble family in Upper Hungary, possessing also large estates in Transylvania, and which had adopted the Protestant faith. During the troubles which distracted the country under the governments of Sigismund and

Gabriel Bathori, Bethlen formed a party among the magnates of the country; and, on the death of the Bathoris, with the aid of the Turks, assumed the rank of prince of Transylvania in 1613. Austria was at that time in no condition to withstand his pretensions; and when, in 1619, the Bohemian states also rose against Austria, Bethlen entered into a treaty with them, entered Hungary, took Presburg, menaced Vienna, and caused himself to be elected king of Hungary on 25th August 1620. Austria however recovered herself, and Bethlen concluded a peace with the emperor Ferdinand, by which he surrendered Hungary, gave up the title of king, and received in return the town of Kaschau, seven Hungarian counties, and the Silesian principalities of Oppeln and Ratibor. In 1623 he again attacked Austria, and advanced to Brünn in Moravia with 60,000 men. Bethlen-Gabor's policy had always been to support the Protestant interest in Germany, and he expected to have been joined at Brünn by Christian duke of Brunswick; but Brunswick had been defeated by Lilly, and had fled to England. This induced Gabor to conclude a truce with Austria, and subsequently a peace confirming the conditions of the previous treaty. In 1626 Gabor was induced again to take up arms by Count Christian von Mansfeld, and they were to join their forces in Hungary. Mansfeld was twice beaten by Wallenstein, but reinforced his army; and on September 8th reached the banks of the Waag in Hungary, though with not more than 5000 men. Wallenstein was between him and Gabor with 50,000 men. Mansfeld thereupon gave up the command of his troops to the duke of Saxe Weimar—withdrew, and died a few weeks afterwards; and Gabor concluded a new treaty with the emperor. He did not survive long, dying on November 5, 1629, without children, leaving his country and his wife, by his will, to the protection of Ferdinand II., and naming as executor the Turkish sultan.

The reign of Bethlen was a glorious one for Transylvania. The part which he took in the thirty years' war gave an European importance to that country, which she has never since attained; and he raised her in civilised rank by founding the Academy of Karlsburg (Weissemburg), for which he procured the assistance of several eminent professors. Bethlen himself was a man of great talent, a consummate general, of indefatigable energy, and of determined resolution. He was a rigid Calvinist, but though he professed to fight for the religious liberties of Hungary, he scrupled not to put to death dissenters from the orthodoxy of Transylvania.

(*Conversations-Lexikon.*)

BETTERTON, THOMAS. This celebrated actor was born in August 1635, in Tothill-street, Westminster, his father being at that time under-cook to Charles I. Shortly after the breaking out of the civil war young Betterton was apprenticed to a bookseller named Rhodes, at the sign of the Bible, Charing Cross. In 1659 Rhodes, who had been wardrobe-keeper at the theatre in Blackfriars before the civil wars, obtained a licence for a company of players to act at the Cock-pit in Drury-lane; and here young Betterton commenced his career as an actor at the age of twenty-four, performing with the greatest success in several of Beaumont and Fletcher's plays, then most in fashion.

In 1662 he was engaged by Sir William Davenant, and appeared on the opening of the theatre in Lincoln's Inn Fields in Sir William's new play the 'Siege of Rhodes.' His performance of Hamlet about this time received high commendation from Addison, Cibber, and others. He became so much in favour with Charles II. that Cibber asserts he went over to Paris at his Majesty's especial command to study the French stage, and introduce from it whatever he thought would improve our own, and that it is to him we are indebted for moving scenery, although some writers ascribe its introduction to Sir William Davenant.

In 1670 he married an actress of the name of Saunderson, whose Lady Macbeth was considered one of the most admirable representations on the stage. In 1692 Betterton had the misfortune to lose all his little savings (which, though his salary is said never to have exceeded 4l. per week, had amounted to 2000*l.*) in a commercial speculation. The influence of the Earl of Dorset obtained for him shortly afterwards the royal licence for a new theatre, which he was speedily enabled, by the voluntary subscriptions of many persons of quality, to erect within the walls of the Tennis Court, Lincoln's Inn Fields. He opened it April 30th, 1695, with Congreve's comedy of 'Love for Love,' which was very successful; but after a few years, the profits arising from the theatre proving very insignificant, and Mr. Betterton growing very infirm and suffering continually from the gout, he retired at once from management and the stage. The narrowness of his circumstances being known to the public, it was determined to give him a benefit; and on Thursday, the 6th of April, 1709 (see the 'Tatler,' No. 1), the comedy of 'Love for Love' was performed for that purpose, Betterton himself, though nearly seventy-four, sustaining the youthful part of Valentine. The profits of the night are said to have amounted to 500*l.* He was prevailed upon to perform occasionally during the following winter. On Thursday, the 18th of April 1710, he took another benefit, an invitation to which was published in the 'Tatler' of Tuesday, the 11th (No. 157). On this occasion he enacted his celebrated part of Melantius in the 'Maid's Tragedy.' The event however proved fatal; for having been suddenly attacked by the gout, in order to prevent disappointment he made use of some outward applications, which reduced the swelling and enabled

him to walk on the stage with one foot in a slipper; but the violence of the remedy drove the distemper into his head, which a few days afterwards terminated his existence in the seventy-fifth year of his age. He was buried on Tuesday, May 2nd, 1710, in the cloisters of Westminster, "with much e-remony," according to the 'Tatler' for Thursday, May 4th (No. 167). Betterton was the greatest actor of his time, and his personal character was excellent. He enjoyed the rare felicity of being lauded by Dryden, Rowe, and Pope, as well on account of his character as his abilities. Pope painted his portrait in oil, and the picture is said to be still preserved at the Earl of Mansfield's, Caen Wood.

Mr. Betterton wrote and altered several dramatic pieces, but none of them have kept possession of the stage. Queen Anne settled a pension upon his widow, who survived him only a year and a half.

BETTINELLI, SAVERIO, was born at Mantua in 1718, and studied at Bologna, where he entered the order of the Jesuits in 1736. He was afterwards sent to Brescia, and there became acquainted with Mazzuchelli, Duranti, Cardinal Quirini, and other learned men, whose conversation encouraged him in his literary pursuits. In 1744 he returned to Bologna, in 1748 he went to Venice, and in 1751 to Parma, where he was director of the studies in the college of the nobility. In 1755 he travelled through part of Germany as tutor to the two sons of Prince Hohenlohe. Towards the end of 1757 he accompanied the princess of Parma to Paris; he afterwards visited Normandy, and then went to the court of King Stanislaus at Nancy, who was a patron of literary men, and who charged Bettinelli with a commission for Voltaire, relative to half a million of francs which Voltaire intended to employ in Lorraine. Voltaire received Bettinelli with great kindness, and afterwards occasionally corresponded with him. Bettinelli returned to Parma in 1759. In the same year he went to Verona, where he stayed about eight years, and there wrote his 'Risorgimento d'Italia negli Studj, nelle Arti e nei Costumi dopo il Mille,' which he published in 1773, just after the suppression of the order of Jesuits. On his return to his native Mantua, he published, in 1780, an edition of his various works in eight vols. 8vo. In 1796 the French invasion drove Bettinelli away from Mantua, and he took refuge at Verona, where he became acquainted with Ippolito Pindemonte. Bettinelli returned to Mantua after that place had surrendered to the French, and resumed his literary occupations, notwithstanding his advanced age of fourscore. Bonaparte made Bettinelli a knight of the Iron Crown, and a member of the National Institute. Bettinelli died at Mantua in September, 1808, being past ninety years of age. His life is chiefly remarkable on account of his having been intimate with several successive generations of learned men, and his forming a connecting link between the Italian literature of the 18th and 19th centuries.

Bettinelli's 'Risorgimento' is the only work by which his literary reputation is now sustained. In the first part of the work he gives a minute and interesting account of the gradual progress of literature and science in Italy, from the darkness of the 9th to the brilliancy of the 14th century, thus carrying the reader towards the age of the Medici, which constitutes a second and distinct epoch. In the second part of his work he treats of the fine arts, of the progress of industry, of commerce, of wealth, and of manners and habits during the same period. The 'Risorgimento' was reprinted at Milan in four vols. 12mo, 1819-20. Among Bettinelli's other works we may mention 'L'Entusiasmo;' 'Lettere Virgiliane,' in which the author shows a great deficiency of taste and critical judgment, accompanied by much flippancy and dogmatism. In a reply to Gasparo Gozzi, who vindicated Dante's fame, Bettinelli persisted in his depreciation of the great poet, whom he absurdly placed below Bembo and Della Casa in poetical rank.

BEVERIDGE, WILLIAM, was born at Barrow, in the county of Leicester, in the year 1638. He was admitted of St. John's College, Cambridge, in 1653; and during his residence there was remarkable for close attention to his studies, for his piety, and the general regularity of his conduct. So assiduous was his application, and more especially in the learning of the Oriental languages, that he published at the early age of twenty a treatise in Latin, 'De Linguarum Orientalium, præsertim Hebraicæ, Chaldaicæ, Syriacæ, Arabicæ, et Samaritanæ, præsentia et usu, cum Grammaticâ Syriacâ, tribus libris traditâ,' a work held in great esteem. He took his degree of Bachelor of Arts in 1656, and that of Master of Arts in 1660, in which latter year he was ordained both deacon and priest. Soon after he was presented by Sheldon, bishop of London, to the vicarage of Ealing in Middlesex, where he wrote his work on chronology. This treatise is considered to be a useful introduction to that study; it was published in 1669, and entitled 'Institutionum Chronologicarum libri duo, unâ cum totidem Arithmetices Chronologicæ libellis.' In 1672 he was elected by the lord mayor and aldermen of London to the rectory of St. Peter, Cornhill, on which occasion he resigned the vicarage of Ealing; and in the same year he published in two volumes folio his learned and laborious work, 'Συνόδιος, sive Pandectæ Canonum SS. Apostolorum et Conciliorum ab Ecclesiâ Græcâ receptorum; nec non Canonicarum SS. Patrum Epistolarum,' &c.: a collection of the various canons issued from those attributed to the apostles to those of the Synod of Constantinople, which restored Pholius, with various canonical letters; the whole being elucidated by copious and very learned notes.

In his new parochial charge his earnestness and diligence were so constant, and his labours in the service of the church so unwearied yet

prudent, that he obtained the appellation of 'the great restorer and reviver of primitive piety,' and his parish was referred to as a model of Christian regularity and order. It is delightful to contemplate such a character in any instance, but in this it is the more remarkable and the more worthy of admiration when we look to the nature and course of his studies. The favourable notice of his diocesan, Dr. Henchman, was exemplified in his collation by that prelate in 1674 to the prebend of Chiswick, in the cathedral of St. Paul's; and in 1681 he received a further mark of approbation and confidence in his collation by Bishop Compton, the successor of Henchman, to the archdeaconry of Colchester. In 1684 he became prebendary of Canterbury, and at the revolution was nominated chaplain to King William and Queen Mary. On the deprivation of Bishop Kenn, who had refused to take the new oaths, the bishopric of Bath and Wells was offered to him, which however he declined; and it was not till July 1704 that he attained episcopal rank as Bishop of St. Asaph on the translation of Dr. Hooper to Bath and Wells. As in every station he had hitherto filled the performance of his duty was his main object, so in this he manifested the same activity and the same earnestness; it seemed to be the aim of his endeavours to make others what himself had been. Immediately on his promotion he addressed a 'Pastoral Letter to his Clergy,' pressing upon them the important duty of catechising; and the more to enforce his recommendation, he at the same time printed his 'Church Catechism Explained,' a useful tract, as the many reprints of it testify. This excellent man possessed his episcopal see not quite four years, dying on the 5th of March 1708, in the seventy-first year of his age. He died at Westminster in the cloisters of the abbey, and was buried in St. Paul's cathedral. The larger portion of his property he bequeathed to the uses of the two societies for Promoting Christian Knowledge, and for Propagating the Gospel in Foreign Parts. The works already described do not comprehend the whole of the published writings of the bishop, but they are all which were published in his lifetime. A number of posthumous works, including his well-known and often-reprinted 'Private Thoughts upon Religion,' 'Private Thoughts upon a Christian's Life,' 'Meditations,' and 'Sermons,' were published afterwards; and the whole, with the life of Bishop Beveridge and copious indexes, were published in 1824, in 9 vols. 8vo, by the Rev. Thomas Hartwell Horne.

BEVERLEY, JOHN DE, a celebrated English ecclesiastic of the 7th and 8th centuries. Fuller remarks, in recording the history of Yorkshire worthies, that St. John of Beverley may be claimed by this county on a three-fold title: because he was born at Harpham in the county; because he was upwards of thirty-three years archbishop of York; and because he died at Beverley, in this county, in a college of his own foundation. He was one of the first scholars of his age, having been instructed in the learned languages by Theodore, archbishop of Canterbury, and he was himself tutor of the venerable Bede. The following works are attributed to him:—1, 'Pro Luca Exponendo,' an essay towards an exposition of St. Luke, addressed to Bede; 2, 'Homiliæ in Evangelia;' 3, 'Epistolæ ad Herebaldum, Andenum, et Bertinum;' 4, 'Epistolæ ad Holdam Abbatissam.' He was advanced to the see of Haguotold, or Hexham, by Alfred, king of Northumberland; and on the death of Bosa, archbishop of York, in 687, he was translated to the vacant see. In 704 he founded a college at Beverley for secular priests. In 717 he retired from his archiepiscopal functions to Beverley, where he died, May 7th, 721. Three or four centuries after his decease his body was exhumed by order of Alfric, archbishop of York, and placed in a richly-adorned shrine. When William the Conqueror ravaged the north with a numerous army, he gave orders that the town of Beverley should be spared; and a synod, which was held at London in 1416, directed the anniversary of his death to be commemorated among the festivals of the church. Fuller says, in his account of John of Beverley, which was published in 1660, that his picture was to be seen in a window at the library at Salisbury, with an inscription under it, "whose character may challenge three hundred years of antiquity, affirming him the first Master of Arts in Oxford."

In the 14th century lived JOHN OF BEVERLEY, the Carmelite monk. He was a doctor and professor of divinity at the university of Oxford, and wrote, 1, 'Questiones in Magistrum Sententiarum;' 2, 'Disputationes Ordinariae.'

BEWICK, THOMAS, justly called the reviver of wood-engraving, was born at Cherryburn, near Newcastle-upon-Tyne, in 1753. He evinced from his infancy an ability to draw, and was accordingly, at the usual age, apprenticed to Ralph Beilby, an engraver of Newcastle, who had some reputation in that town. Dr. (then Mr.) Hutton consulted Beilby upon the best method of engraving the diagrams to his treatise on Mensuration; the engraver strongly recommended that they should be cut in wood, for various reasons, and by Thomas Bewick. Accordingly, in 1770, the work appeared, with complete success; and was followed by several other mathematical works.

Bewick now attempted works of much higher pretensions. He designed a set of illustrations to Gay's Fables, and for one of the cuts, the 'Old Hound,' he obtained, in 1775, a premium for the best wood engraving offered by the Society of Arts. The work was published in 1779. In 1784 Mr. Saint published a set of 'Select Fables,' with cuts by Bewick. After these works he commenced, in partnership with his old master Mr. Beilby, to prepare a 'General History of Quadrupeds,' which was completed in 1790, went through several

editions, and obtained Bewick a great reputation. The designs in this work are by Bewick and his brother John, who was his pupil; and they are all executed with great natural truth, and in a free correct manner. The cuts themselves are superior to anything that was ever done in the same style before, and are inferior only to the best cuts of the present day in mechanical execution and clearness of line. As works of art they still have the advantage. His history of Quadrupeds was followed, in 1795, by Goldsmith's 'Traveller' and 'Deserted Village,' Parnell's 'Hermit,' and Somerville's 'Chase.' The 'Chase' was the last work in which Thomas was assisted by his brother; all the cuts were executed by Thomas, but the designs were by John. John Bewick died of consumption in 1795, aged thirty-five. In 1797 Thomas published the first volume of his 'History of British Birds,' which is his best serial work: the second volume was published in 1804. This is also the last work he undertook in partnership with Mr. Beilby. They dissolved partnership during its progress.

Bewick had a numerous school, and was latterly much occupied in teaching; and in his last works was greatly assisted by his pupils, of whom Harvey and Clennel have since particularly distinguished themselves in the same line of art.

The most considerable of Bewick's latest works is 'The Fables of Æsop and others.' He prepared some vignettes for a work on 'British Fishes,' but they were not published. His very last work was a cut of an old horse, for the head of a paper against cruelty to animals. He died in 1823, aged seventy-five. His masterpiece is considered to be a large cut of a bull of the ancient Caledonian breed, from Chillingham Park; a proof of this cut on vellum has been sold for twenty guineas. Bewick's services and merits are fully discussed in 'The History of Wood Engraving, with Illustrations' by J. Jackson; and there is a memoir of him, of considerable detail, in the 'Gentleman's Magazine' of 1829.

BEZA, an eminent theologian of the Calvinistic branch of the reformed church. He is commonly known by the Latinized name of Beza, but his real name was Théodore de Bèze. He was a Frenchman, born of noble parents, in 1519, at Vezelay, a small town of which his father was bailli, in the department of Yonne. While yet only an infant he was sent to Paris, and placed under the care of an uncle, Nicolas de Bèze, who held the office of judge in the parliament of Paris. The cause of this early separation from his parents does not appear. This uncle brought him up tenderly, and before he was ten years old placed him under the care of Melchior Wolmar, a learned German, resident at Orléans, who was especially skilled in the Greek language. On Wolmar being appointed to a professorship in the university of Bourges, Beza accompanied him, and remained, in the whole, for seven years under his tuition. During this time he became an excellent scholar, and he afterwards acknowledged a deeper obligation to his tutor, for having "imbued him with the knowledge of true piety, drawn from the limpid fountain of the word of God." In 1535 Wolmar returned to Germany, and Beza repaired to Orléans to study law; but his attention was chiefly directed to the classics and the composition of verses. His Latin verses, published in 1548, were chiefly written during this period of his life.

Beza obtained his degree as licentiate of civil law when he had just completed his twentieth year, upon which he went to Paris, where he spent nine years. He was young, possessed of a handsome person, and of ample means; for though not in the priesthood, he enjoyed the proceeds of two good benefices, amounting, he says, to 700 golden crowns a-year. The death of an elder brother added considerably to his income, and an uncle, who was abbot of Froidmond, expressed an intention of resigning that preferment, valued at 15,000 livres yearly, in his favour. Under such circumstances, in a city like Paris, he was exposed to strong temptation; and his conduct during this part of his life has incurred great censure. That his life was grossly immoral he denies; but he formed a private marriage with, or rather engaged to marry, a woman of birth, he says, inferior to his own, but possessed of such virtue that he never found reason to repent of the connection. It was covenanted that he should marry her publicly as soon as the obstacles to that step should be removed, and that in the meantime he should not take orders, a thing entirely inconsistent with taking a wife. Meanwhile his relations pressed him to enter into the church; his wife and his conscience bade him avow his marriage and his real belief; his inclination bade him conceal both and stick to the rich benefices which he enjoyed; and in this divided state of mind he remained till a serious illness brought him to a more manly and a more holy temper. Immediately on his recovery he fled to Geneva, at the end of October 1548, and there publicly solemnised his marriage and avowed his faith.

The more serious charges brought against him in after life in the heat of controversy, appear to rest on no good foundation. One is to be excepted. The charge of general licentiousness has been supported by reference to the indecency of some of his early poems published at Paris in 1548, in his 'Juvenilia,' which his enemies justly alleged to be inconsistent with the character of a reformer and father of the church. This offence, which Beza never sought to extenuate, is a grave one, but it affords no ground for casting the imputation of hypocrisy, or any other, on his subsequent life. When he became earnest in his religion, he repented of his indecency; and both by public avowals of his contrition, and by endeavouring to suppress

the offensive verses, he made such amends as he could for his offence against morality.

After a very short residence at Geneva, and subsequently at Tübingen, Beza was appointed Greek professor of the college of Lausanne. During his residence here he took every opportunity of going to Geneva to hear Calvin preach, at whose suggestion he undertook to complete Clement Marot's translation of the Psalms into French verse. Marot had translated 50, so that 100 Psalms remained: these were first printed in France with the royal licence in 1561. Beza, at this time, employed his pen in support of the right of punishing heresy by the civil power. His treatise, 'De Hæreticis a Civili Magistratu puniendis,' is in defence of the execution of Servetus at Geneva in 1553. Beza was not singular in maintaining this doctrine; the principal churches of Switzerland, and even Melancthon, concurred in justifying by their authority that act which has been so fruitful of reproach against the party by whom it was perpetrated. His work 'De Jure Magistratum,' published at a much later time in his life (about 1572), presents a curious contrast to the work 'De Hæreticis,' &c. In this later work he asserted the principles of civil and religious liberty and the rights of conscience; but though he may be considered as before most men of his age in the boldness of his opinions as to the nature of civil authority, his views of the sovereign power, as exhibited in this work, are confused and contradictory. During his residence at Lausanne, Beza published several controversial treatises, which his friend, colleague, and biographer, Antoine la Faye, confesses to be written with a freer pen than was consistent with the gravity of the subject. To this portion of Beza's life belongs the translation of the New Testament into Latin, completed in 1556, and printed at Paris by R. Stephens in 1557. The best edition is said to be that of Cambridge, 1642. It contains the commentary of Camerarius, as well as a copious body of notes by the translator himself. For this edition he used a manuscript of the four Gospels, which in 1581 he gave to the University of Cambridge. It is generally known as Beza's Codex, and a fac-simile edition of it was published in 1793.

After ten years' residence at Lausanne, Beza removed to Geneva in 1559. The admiration which he already felt for Calvin was greatly increased by closer intimacy. About this time he entered into holy orders. At Calvin's request he was admitted to be a citizen of Geneva; he was appointed to assist that remarkable man in giving lectures in theology; and on the academy or university of Geneva being founded by the legislature, he was appointed rector, upon Calvin declining that office. It seems to have been in the same year that, at the request of some leading nobles among the French Protestants, he undertook a journey to Nerac, in hope of winning the king of Navarre to Protestantism, or at least of inducing him to interfere in mitigation of the persecution to which the French Protestants were then exposed. His pleading was successful, and he remained at Nerac until the beginning of 1561, and at the king of Navarre's request attended the conference of Poissy, opened in August of that year, in the hope of effecting a reconciliation between the Catholic and Protestant churches of France. Beza was the chief speaker on behalf of the French churches. He seems on the whole to have managed his cause with temper and ability, and to have made a favourable impression on both Catherine of Medicis and Cardinal Lorrain.

Catherine requested him to remain in France, on the plea that his presence would tend to maintain tranquillity, and that his native country had the best title to his services. He consented; and after the promulgation of the edict of January 1562 often preached publicly in the suburbs of Paris. The short-lived triumph of toleration was ended by the massacre of Vassy and the civil war which ensued. During that contest, which closed in March 1563, Beza attached himself to the person of Condé, at that prince's earnest request. He was present at the battle of Dreux, where Condé was taken prisoner; but not as a combatant, as he positively asserts in his answer to his calumniator, Claude de Xaintes. We may here notice the accusation brought against him of having been concerned in plotting the murder of the Duke of Guise in 1563, founded on the confession of the murderer Poltrot; but Poltrot retracted this accusation, and, to the hour of his death, asserted the innocence of Beza.

At the end of the war Beza returned to Geneva. In 1564 he was appointed teacher of theology, on the death of Calvin, whose labours he had shared, and with whom he had lived in strict union and friendship. He then took an assistant, as Calvin had taken him: at a later period Antoine la Faye filled that office. Beza succeeded not only to the place, but to the influence of Calvin, and thenceforth was regarded as the head and leader of the Genevese church. In 1571 he was requested to attend the general synod of French Protestants held at Rochelle; and he was elected moderator or president of that assembly, by which the confession of faith of the Gallican church was settled. In 1572 he was again requested to attend a synod held at Nismes, where he opposed successfully a new form of church discipline, which Jean Morel attempted to introduce. After the massacre of St. Bartholomew, in 1572, Beza showed himself prompt to succour the distressed Protestants who flocked to Geneva. He supported, according to La Faye, fifty clergymen, who were among them, for three years, chiefly by his exertions in raising subscriptions in their behalf in England, Germany, and France.

His first wife died in 1588. In the course of a few months he took

a second wife, a young widow, to whose care his declining years were indebted for much comfort. He scarcely manifested the infirmities of age until 1597, when he was obliged on more than one occasion to quit the pulpit, leaving his sermon incomplete. In the autumn of 1598 he ceased to attend the schools. He preached for the last time, January 13, 1600. He declined gradually under the weight of years, but excepting the partial loss of memory in respect of recent occurrences, he retained his intellect unclouded to the last. He died October 13, 1605. An interesting account of his last moments is given by La Faye.

Beza was a man of undoubted learning, talent, and zeal for the interests of the church to which he belonged. His eminence is testified by the virulence with which he has been attacked both by Roman Catholic and Lutheran divines. His writings are now nearly forgotten: in addition to those which we have specified, we may add his 'Confession of the Christian Faith,' 1560, written, it is said, to justify himself, and in hope of converting his father; and his 'Ecclesiastical History of the Reformed Churches of France, from 1521 to 1563,' published in 1580. He also wrote a 'Life of Calvin.' La Faye has given a list of Beza's works, which are fifty-nine in number.

(Antonius Fayus, *De Vita et Obitu Bezae*; Bayle.)

BIANCHINI, FRANCESCO, born at Verona, December 13, 1662, studied at Padua, where he applied himself to mathematics under the learned Professor Montanari. He also made great progress in classical learning, a taste for which induced him, after he left the university, to proceed, in 1684, to Rome, where he became librarian to Cardinal Pietro Ottoboni. In this situation Bianchini devoted all his time to study: he investigated the monuments, medals, inscriptions, and other remains of antiquity which Rome abounds; and he then conceived the idea of a universal history, grounded not so much upon written authorities, as upon the monuments of former times which have been found in various parts of the world.

In 1680, according to Lalande in his 'Bibliographie Astronomique,' he published at Bologna a 'Dialogo Fisco-Astronomico contro il Sistema Copernicano.' In 1689, Cardinal Ottoboni having become pope, under the name of Alexander VIII., was enabled to provide for Bianchini, by making him a canon of Santa Maria ad Martyres, and bestowing on him some pensions besides. Alexander's pontificate was very short, but it placed Bianchini above want. Alexander's nephew, also called Cardinal Ottoboni, continued after his uncle's death to patronise Bianchini, and retained him in the office of librarian.

In 1697 Bianchini published the first part of his universal history: 'Istoria Universale provata coi Monumenti e figurata coi Simboli degli Antichi,' 4to, Rome, 1697. It begins with the first records we have of the eastern nations, and ends with the destruction of the Assyrian empire under Sardanapalus, and is full of curious erudition: it is illustrated by plates. Bianchini however did not continue the work. Clement XI., who was raised to the papal chair in 1700, sent him to Naples in 1702, to accompany the Cardinal Legate Barberini, who went to congratulate Philip V. of Spain when he came to take possession of that kingdom. Clement also bestowed several minor appointments on him, and made him a canon of Santa Maria Maggiore. Bianchini had taken deacon's orders, but he never would be ordained presbyter.

In 1703 Bianchini wrote two dissertations on the Julian Calendar, and on the various attempts made, especially by St. Hippolytus, for reforming it previous to the Gregorian reform: 'De Calendario et Cyclo Cæsaris, ac de Canone Paschali Sancti Hippolyti martyris,' 'Dissertationes duæ ad S. D. N. Clementem XI., Pont. Max., Roma, 1703. Bianchini was employed by the pope in drawing a meridian line in the church of La Madonna degli Angeli, like that traced by Cassini in the church of San Petronio at Bologna. In 1712 he was sent by Clement XI. to France to carry the cardinal's hat to the newly-made cardinal, Rohan Souffise. After going to Paris, he went to Holland, and afterwards to England, when he visited Oxford, and was received everywhere with marked attention by the learned. Having returned to Rome in June 1713, he resumed his labours both in astronomy and archaeology. He superintended, with great care, a fine edition of the lives of the popes by Anastasius, with notes and comments: 'Vitis Romanorum Pontificum a B. Petro Apostolo ad Nicolaum I. perductæ, curâ Anastasii S. R. Ecclesiæ Bibliothecarii,' 3 vols. folio, 1718-28. The fourth and last volume was published after Bianchini's death by his nephew, Giuseppe Bianchini, in 1745.

In the year 1726, an ancient building was discovered near the Via Appia, about a mile and a half outside of Rome, consisting of three sepulchral chambers of the servants and freedmen of Augustus and his wife Livia. Only one of the three rooms was cleared of the earth and rubbish, which Bianchini inspected carefully. Rows of small niches, like pigeons' nests, one row above the other, ran along the four sides of the room, and every niche contained two or more 'olla cineraria,' or little urns of terra cotta, in which the ashes of the dead were deposited. Above the niches were tablets containing the names and the offices of the persons whose remains lay in the urns beneath. The total number of urns in that one room was above 1000. Another building of the same description had been discovered some years before in another vineyard by the Via Appia, about half a mile nearer Rome. It also consisted of three rooms, which contained at least 3000 urns, likewise of servants and liberti of Augustus: Fabbretti published a description of them. The names in the inscriptions denote individuals from every part of the Roman empire, some natives

of Asia Minor and Syria, and others from the banks of the Danube, the Rhine, or the Ebro. Some of the inscriptions refer to the time of Claudius, and even to a later period, but by far the greater number belong to the time of Augustus. Other sepulchral deposits have been found of the slaves and freedmen of that emperor and his wife Livia, altogether showing the amazing number of servants attached to the great Roman families. Bianchini published the description of the room which he had inspected: 'Camera ed Inscrizioni Sepolcrali dei Liberti, Servi, ed Ufficiali della Casa di Augusto scoperte nella Via Appia, ed illustrate con le Annotazioni di Monsignore Francesco Bianchini, Veronese, l'anno 1726,' fol., Roma, 1727. After exploring by day the sepulchral chambers in the Via Appia, Bianchini used to attend to his observatory by night. The planet Venus was the principal object of his observations. By attentively examining the spots on that planet, he was enabled to determine the period of its rotation. The result of his observations was published under the title of 'Hesperii et Phosphori nova Phenomena, sive Observations circa Planetam Veneris, a F. Bianchini, S. D. N. Papæ Prelato Domestico,' Roma, 1728.

Bianchini formed the design of drawing a meridian line through Italy, from the Adriatic to the Mediterranean, passing through Rome, Mount Soracte, Assisi, Gubbio, &c. With this view he carried on his operations for eight years, at his own expense, and was obliged at last to give them up for want of means. An account of his labours was published after his death by his friend Eustachio Manfredi of Bologna.

While Bianchini was one day in 1727 exploring the ruins of the palace of the Cæsars on Mount Palatine, he fell through a broken vault to a considerable depth, and hurt himself severely. Having recovered his health in some measure, he resumed his elaborate description of those immense ruins, which however was not published till after his death: 'Del Palazzo de' Cesari in Roma, opera postuma,' fol. Verona, 1738, with some fine engravings. He died at Rome, March 2, 1729, and was buried in Santa Maria Maggiore. The city of Verona raised a handsome monument to his memory in the cathedral. There are 'éloges' of him in the 'Nouvelles Littéraires de Leipsig,' January, 1731, and the 'Hist. de l'Académie,' 1729. Mazzuchelli and Mazzoleni have written biographies of Bianchini, with a long list of his works.

*BIARD, AUGUSTE-FRANÇOIS, an eminent French painter, was born at Lyon in 1800. Originally intended for the church, it was not till his sixteenth year that he received a few months instruction in drawing in the schools of design at his native place. He was then placed for awhile in the establishment of a manufacturer of artistic paper-hangings; and afterwards in the school of painting at Lyon, where however he only studied for a single session. His knowledge of his profession has in fact been almost entirely acquired without any formal or academic instruction; and to his somewhat erratic course of study may, no doubt, be ascribed much of his singular freedom from conventionalism in composition and colour, and something also, perhaps, of his occasional seeming wilful disregard of the ordinary rules and proprieties of art.

Before fairly settling down as a painter, M. Biard obtained a wide and valuable store of experience of the customs and aspects of men in different countries. Having in 1827 obtained an appointment as draughtsman on board a sloop of war, he in that capacity visited Malta, the Grecian Archipelago, Syria, Algiers, &c. The following year he resigned this post in order to extend his travels, and journeyed in succession through England, Scotland, Switzerland, Italy, Spain, some parts of Africa, Russia, Norway, Lapland, and Sweden, filling his sketch-books and portfolios with innumerable views, portraits, characteristic groups and figures, costumes, &c., drawn from all parts of the wide regions traversed by him. As early as 1830 a picture representing 'An Attack of Brigands' had been purchased by the Duchesse de Berry; and from that time each annual exposition bore testimony to his remarkable industry and growing artistic powers. In 1832 his 'Family of Mendicants' gained the gold medal at the Paris Exposition; in 1833 his 'Les Comédiens Ambulants,' which now adorns the gallery of the Luxembourg, was purchased by the government. His position was by this time assured, and success incited him to follow more resolutely the bent of his own peculiar genius. Instead of the ordinary class of 'genre' pictures which he had at first essayed, he now painted such subjects as his 'Mohammedan Priest among the Bedouins,' a 'Concert of Fellahs,' an 'Attack of Spanish Brigands in the Sierra Morena,' and others exhibiting his observance of national peculiarities during his travels; but he also struck into that path which has given him a distinct place among the French painters of the present day, by painting, in 1834, his 'Crossing the Line,' and in 1835, the 'Slave Trade.' These, and such as these, though strikingly diverse in aim, are pictures of remarkable power and originality. Yet where, as with him is often the case, the subject is of a grave and even painful character, they have much of a grim grotesqueness intermingled with the sterner details; while, where the theme is of a humorous cast, amidst a great deal of what might be termed a species of over-elaborate pictorial buffoonery, there is not a little that is suggestive of a very opposite sentiment. The pictures above-mentioned of 'Crossing the Line' and the 'Slave Trade' were repeated by him for the Exhibition of the Royal Academy, London, in 1840, and while their vigorous conception and masterly execution commanded

general attention, their startling freedom and striking incongruities excited almost as general astonishment,—which was certainly not lessened by a picture exhibited at the Royal Academy in 1841, of a 'Scene on board a Steamer crossing from Havre to Honfleur.' Still, though M. Biard too often verges on caricature—at least for English taste—there can be no question of his remarkable success, in both the styles of which the 'Slave Trade' and the 'Hôpital de Fous,' on the one hand, and the 'Crossing the Line,' and the 'Departure from a Bal Masqué' on the other, are the types. When he attempts a more classical theme he becomes conventional and almost vapid. His Harems and works of that class, though rather numerous, are likewise not very favourable specimens of his pencil. The pictures which have made him so great a favourite with his countrymen are those more strictly burlesque ones, like the 'Distribution of Prizes in a German School,' 'Le Triomphe de l'Embonpoint,' 'Le Repas Interrompu,' 'La Poste Restante,' 'Le Concert de Famille,' 'Le Bain de Famille,' 'the Parade of the National Guard,' &c. Besides these M. Biard has painted a very large number of pictures in each of the styles he practises; and his industry has hitherto suffered little abatement. He is still in the prime of his powers, and maintains his place as one of the most original painters of the age.

(P. De Gembloix, in *Nouvelle Biographie Universelle*.)

BIAS, one of the seven philosophers called the 'Wise Men of Greece.' The exact dates of his birth and death are not known, but it appears from Herodotus (i. 170), that he was living at the time of the first conquest of Ionia by the Persians under Cyrus, B.C. 544-539. He was born at Priene, and his father was named Teutamius. One of the stories told of him is, that when Alyattes, king of Lydia, besieged Priene, Bias fattened two mules, and sent them out into the Lydian camp. The king, surprised and dispirited by the apparent plenty which the good condition of the animals indicated, sent a messenger to treat of peace. On this, Bias directed the citizens to make heaps of sand, and cover them lightly over with grain. He took care that the messenger should see these heaps; and the man on his return represented the abundance in the city in such a light, that Alyattes immediately agreed to terms of peace. A similar story is told by Herodotus of Thrasybulus, tyrant of Miletus (i. 21, 22). The same author (i. 27) relates the manner in which either Bias or Pittacus deterred Croesus from invading the Grecian islands. These stories are worth notice, as indicating what is to be understood of the Seven Wise Men. They were not philosophers in the sense in which the word is commonly used, to designate men who have entered deeply into speculative science, for Thales, the founder of the Ionic school, was the only one of them who had any claim to that title: they seem merely to have been men of high repute for moral, political, or legislative knowledge, such as it then existed. Thus the few remains of them which are extant are comprised in the form of short pithy maxims, generally in verse, with the sentiment of which we are now so familiar, for the most part, as to regard them as self-evident propositions or truisms, and are therefore likely to underrate the merit of those who first enunciated them. Of this class of sayings we find the following, among others, ascribed to Bias:—Being asked "What is difficult and unpleasant?" he replied, "To bear with nobleness the changes from better to worse." "What is sweet to man?" Answer, "Hope." He said that it was better to arbitrate between your enemies than between your friends, because one of the enemies was sure to turn to a friend, and one of the friends sure to turn to an enemy.—"Life should be so ordered as if men were to live a long time and a short one."—"Be slow to set hand to work, but what you begin abide by."—"Take wisdom as the provision for travelling from youth to age, for of all possessions that sticks the closest." Agreeably to this, it is said that on one occasion, when all persons but himself were collecting their valuables for flight, he replied to those who expressed their wonder at his indifference, "I carry everything of mine about me." He was celebrated for his skill in pleading causes, which however he has the credit of having always employed on the right side. His death took place, after he had pleaded a cause successfully, in extreme old age. After the exertion he reclined with his head on the bosom of his grandson, and on the breaking up of the court he was found to be dead. His fellow-citizens gave him a splendid funeral at the public expense, and consecrated a temple to him, which they called Teutamium. Bias is one of the speakers in the 'Symposium' of Plutarch.

There are three collections of the sayings of the Wise Men: two, attributed to Demetrius Phalereus and Sossiodas, are preserved in Stobæus; a third is by an unknown author. Diogenes Laertius and Plutarch have preserved several apophthegms not found in these collections. The first two collections are preserved in the editions of Stobæus; the third was printed by the elder Aldus at the end of his 'Theocritus,' 1495. The most complete collection of these sayings is by Joh. Conr. Orelli, in the first volume of his 'Moralisten.'

BICHAT, MARIE FRANÇOIS XAVIER, an eminent French anatomist and physiologist, was born November 14, 1771, at Thoirette, in the present department of the Ain. He was the eldest son of Jean Baptiste Bichat, doctor of medicine, of the university of Montpellier. At an early period he manifested a preference for the study of mathematics, but he also mastered with much facility the first difficulties of practical anatomy, which he had commenced under his father's tuition; and his teachers, on becoming further acquainted with him, were

impressed with the indications he gave of mental acuteness. Driven a second time from Lyon by the events of the revolution, he went in 1793 to Paris, in order to study surgery under the celebrated Desault, at that time the great master of the surgical art. Without a single introduction, it is said without even a single acquaintance in this city, he entered the school of Desault, and diligently attended the lectures of his master. In this school it was the practice for some chosen pupils, each in his turn, to make an abstract of the lecture of the day, and on the next day, at the close of the lecture, in the presence of the second surgeon of the hospital, this abstract was publicly read. On one occasion the pupil whose turn it was to give the abstract of the preceding day was absent. Bichat, who had not been a pupil more than a month, stepped forward from the crowd of pupils and offered to supply his place. His account was clear, accurate, and full; and was delivered with extraordinary calmness and precision. Desault had a conversation with young Bichat soon after, and formed such an estimate of his abilities that he insisted on his immediately coming to reside with him; and subsequently adopted him as his son, associated him in his labours, and destined him for his successor. Bichat continued to live with his master in uninterrupted friendship until the death of Desault, about two years from the commencement of their intimacy. After this event the first care of the pupil, as the best expression of his gratitude and affection, was to collect, arrange, and publish the works of his master. At the same time he opened a school for teaching anatomy, physiology, and surgery; dissected for his own lectures; carried on an extended and laborious series of experiments on living animals; gave a course of operative surgery; and when in the evening he returned home exhausted with the labours of the day, instead of betaking himself to repose, devoted the greater part of the night to the duty of putting in order the papers and works of his friend and master. His constitution received a severe shock from this excessive labour; he appears to have suffered particularly from the exertion of public speaking, and in a short time his pursuits were interrupted by an attack of hæmoptysis, or spitting of blood. In the confinement to his chamber which this alarming disease imposed, he appears to have matured his views on some of the most interesting departments of anatomy and physiology, and to have sketched the plan of the works in which those views were subsequently developed. No sooner had his malady disappeared than he resumed the whole of his former occupations, which he pursued with no less intensity than before, spending his days in public teaching and his nights in the composition of his works. One day, when he had been longer than usual in the place where he conducted his experiments on animal tissues—a low and damp room, full of putrid exhalations from the maceration of animal substances—or when, from previous exhaustion, he had been more powerfully impressed by its malign influence, he felt giddy on leaving the room. In this state, on descending the stairs of the Hôtel-Dieu, his foot slipped, and he received by the fall a severe blow on the head. He was taken up insensible, and was carried home; but the next day he thought himself sufficiently recovered to pursue his ordinary occupations, and accordingly began his usual round. In a short time however he fainted from fatigue, and in a day or two symptoms of fever came on, which soon assumed a typhoid character, and proved fatal on the fourteenth day of the attack. Thus perished, at the age of thirty, a young man of extraordinary genius and energy—a melancholy example of a life which promised to be one of uncommon brilliance and usefulness, cut short by the intensity of its devotion to science.

Bichat gave an impulse to the progress of physiology which is still powerfully felt not only in France, but in every country in which the science is known. The idea had been suggested before his time that the animal body consists of a congeries of organs, and that there are primary substances which enter in common into the composition of the several organs; but he was the first, by a systematic analysis, to reduce the complex structures of the body to their elementary tissues, and to ascertain the properties, physical, chemical, and vital, which belong to each simple tissue. This he has done to an extent and with a degree of completeness truly astonishing in a first attempt, in his 'Anatomie Générale,' a work which alone would have given him immortality; which in the production of the material that constitutes its subject-matter indicates minute and laborious research, elaborate and extended experiment, and great manual and practical skill; and in the general conclusions deduced and established, a truly philosophical mind. Scarcely had this work, which was immediately and universally recognised as a production of extraordinary genius, appeared, before it was followed by his 'Anatomie Descriptive.' Besides many separate memoirs of various excellence, he likewise published an elaborate work, entitled 'Recherches physiologiques sur la Vie et la Mort,' in which he suggested and developed the distinction between the organic and the animal life—a distinction of scarcely less importance to the surgeon and physician than to the speculative and experimentalising physiologist.

(M. F. R. Buisson, *Précis Historique sur M. F. X. Bichat*, Paris, 1802.)

BICKERSTAFF, ISAAC, was born in Ireland probably about 1735. He was one of the pages of Lord Chesterfield, who became Lord-Lieutenant of Ireland in 1746. Afterwards he became an officer in the marines, in which service he continued until forced to quit under

circumstances of a highly discreditable nature. He is known as the successful author of a number of light comedies and musical pieces, produced under Garrick's management, of which some yet retain possession of the stage. The principal are—'Love in a Village,' 1763; the 'Maid of the Mill,' 1765; 'Love in the City,' 1767 (since altered to the farce of 'The Romp'); 'The Hypocrite,' 1768; 'Lionel and Clarissa,' 1768; 'The Padlock,' 1768; 'The Captive,' 1769; 'He Would if he Could,' 1769. His last piece, 'The Sultan,' was produced in 1787. The music to many of these pieces was composed by Charles Dibdin. The time and manner of Bickerstaff's death are uncertain: all that is known is that he withdrew to the continent, and died in obscurity. (*Biographia Dramatica; Theatrical Dictionary.*)

BICKERSTETH, REV. EDWARD, was born March 19, 1786, at Kirkby Lonsdale, Westmorland. He was the fourth son of Mr. Henry Bickersteth, a surgeon of that town, and the younger brother of the late Lord Langdale, master of the rolls. He received his early education at the grammar school of Kirkby Lonsdale, but was removed thence on receiving a clerkship in the post-office, London, at the age of fourteen. Here he remained for six years, when he was received into the office of Mr. Bleasdale, a London attorney, as an articled clerk. Having completed his term of five years, he entered into partnership with Mr. Bignold, a fellow clerk, whose sister he married, and commenced business as a solicitor at Norwich in 1812.

The business soon became a flourishing one, and Mr. Bickersteth's prospects appeared very favourable. But he had become deeply impressed with the importance of religious truths, and he soon took a prominent part in the various religious movements for which Norwich was becoming celebrated. The Norwich Church Missionary Society was founded by him, and he was active in promoting the operations of the Bible Society, and several other religious societies in that city. He also wrote and published, in 1814, 'A Help to the Study of the Scriptures,' which in its enlarged form has had an enormous circulation. His own strong religious feelings, aided perhaps by an acquaintance he had formed with Mr. Pratt, Mr. Budd, and some other leading clergymen of the 'evangelical' section of the church, led him to desire earnestly to devote himself to the ministerial office—a desire which those gentlemen strongly encouraged. Accordingly, Mr. Bickersteth was, December 10, 1815, ordained a deacon of the Church of England; the Bishop of Norwich having been induced to dispense in his case with the usual university training, in consequence of its being represented to him that the Church Missionary Society were anxious to obtain the services of Mr. Bickersteth to proceed on a special mission to inspect and re-organise the stations of the society in Africa, and to act afterwards as their secretary. A fortnight later the Bishop of Gloucester admitted him to full orders, and he almost immediately departed with his wife to Africa. He returned in the following autumn, having satisfactorily accomplished the purposes of his visit.

He continued in the zealous discharge of the duties of his secretaryship for the next fifteen years, organising new and visiting old branch associations, directing the studies of the missionaries, continually advocating the interests of the society in the pulpit and on the platform, as well as with his pen; and in the course of his frequent official journeys through all parts of the kingdom, acquiring a constantly increasing amount of influence and popularity in what is commonly designated the religious world. At the end of 1830 he resigned his office, and also his ministerial charge at Wheler Chapel, Spitalfields, upon accepting the rectory of Watton in Hertfordshire. At Watton Mr. Bickersteth spent the remaining twenty years of his life. But his labours were by no means bounded by his parish. He was during the whole of that time in constant request as the advocate, by sermons and speeches, not only of the missionary, but of almost every other religious society connected with the church, or in which, as in the Bible Society, and the Evangelical Alliance (of which he was one of the founders), churchmen and dissenters associate. And he also produced during his residence at Watton a constant succession of religious publications, which were for the most part read in the circles to which they were chiefly addressed with the greatest avidity. Indeed it may be said that during most of these later years of his life Mr. Bickersteth was one of the most influential and generally popular clergymen of that section of his brethren among whom he was classed.

During this period he took a very decided part in all those measures which he regarded as having a direct bearing on the religious condition of the country. He was especially earnest in opposing the Maynooth grant, and in calling for its withdrawal; and he was equally zealous in denouncing the spread of what are known as Tractarian opinions in the Church of England; yet his opposition was free from all personal bitterness, and his influence was directed to softening the asperities of religious strife. In his later years he manifested a growing interest in the study of prophecy. The unfulfilled prophecies were made the frequent subject of his discourses, and he published several pamphlets and tracts and three or four elaborate treatises in elucidation of the prophetic writings.

His principal works besides the 'Scripture Help' already noticed, and a large number of sermons, tracts, &c., were:—'The Christian Student,' 'A Treatise on the Lord's Supper,' 'A Treatise on Prayer,' 'Family Expositions of the Epistles of St. John and St. Jude,' 'A Treatise on Baptism,' 'The Signs of the Times,' 'The Promised Glory of the Church of Christ,' 'The Restoration of the Jews,' 'A Practical

Guide to the Prophecies,' &c. His collected works have been published in 16 vols. 8vo. Among his literary labours ought to be mentioned the Hymn-book which he compiled, and the 'Christian Family Library,' which he edited, and which extended to fifty volumes.

Mr. Bickersteth was in 1841 attacked by paralysis, the result of too prolonged mental exertion. He recovered from this, and resumed his labours. In 1846 he was, when proceeding to a meeting of the Evangelical Alliance, thrown from his chaise under a heavily laden cart, the wheels of which passed over him; but though dreadfully injured he was after a time restored to health and activity, and survived till February 24, 1850, when he died of congestion of the brain, aged sixty-three.

(Birke, *Memoir of the Rev. Edward Bickersteth.*)

BIDDLE, JOHN, styled the Father of the English Unitarians, was born in 1615, at Wotton-under-Edge in Gloucestershire, where his father carried on the trade of a woollen-draper. Being sent to the grammar school of his native town, he gave such proofs of talent and proficiency as attracted the notice of George Lord Berkeley, who conferred on him, at an earlier age than any other scholar, an exhibition of 10*l.* per annum. In 1632, in his 17th year, he was admitted a student of Magdalen Hall, Oxford. He took his degree of Bachelor of Arts in 1638, and that of Master of Arts in 1641. About this time he was elected master of the free school in the crypt in the city of Gloucester, and he performed its duties in a manner that raised the character of the school. His theological studies meanwhile were prosecuted with great ardour; and carrying into these his characteristic freedom of inquiry, he printed for private circulation the result of his investigations in a small tract, entitled 'Twelve Arguments, drawn out of the Scripture, wherein the commonly received opinion touching the deity of the Holy Spirit is clearly and fully refuted.' Having adopted the views indicated in this title, he gave unrestrained expression to them in conversation, and speedily drew upon himself the attention of the authorities. His printed tract was brought under the notice of the parliamentary committee then sitting at Gloucester, and, after the fashion in which religious opinions were handled in those days, he was summoned before a bench of magistrates, who committed him to the county jail, December 2, 1645, although suffering at the time from a dangerous fever. His release on bail was not obtained without considerable difficulty. At his examination before the magistrates he delivered a "confession of faith," which, from its ambiguity, shows that Biddle's mind was then in a state of transition from Trinitarianism to Unitarianism, without being quite decided either way. Six months afterwards Archbishop Usher had a conference with him on the doctrine of the Trinity, without being able to convince him that it was founded in Scripture. About the same time he was summoned before the parliament at Westminster, who appointed a committee to inquire into his case. The proceedings of this committee were protracted through a period of nearly eighteen months, when a decision was arrived at unfavourable to Biddle, who was committed to the custody of one of the officers of the House of Commons, and deprived of his liberty for five years. In the meantime the case was referred to the assembly of divines then sitting at Westminster, before whom Biddle often appeared. Their answers to his doubts only increased his conviction of their validity, and made him feel the importance of giving them greater publicity. For this purpose he resolved to publish the 'Twelve Arguments,' &c., which had only been privately circulated. This was no sooner done than it raised such a spirit of opposition that the book was immediately ordered to be burnt by the common hangman. Undaunted by this proceeding, in the year 1648, while yet in prison, he printed a 'Confession of Faith concerning the Holy Trinity according to the Scriptures, with the Testimonies of several of the Fathers on this Head.' This was followed by another tract, entitled 'The Testimonies of Irenaeus, Justin Martyr, Novatianus, Theophilus (who lived the two first centuries after Christ was born or thereabouts), as also Arnobius, Lactantius, Eusebius, Hilary, and Brightman, concerning that one God and the persons of Holy Trinity.' The publication of these works in succession stimulated the Westminster divines to call upon the House of Commons to pass a measure by which the punishment of death was awarded to the denial of the Trinity, and to other doctrinal points, besides attaching severe penalties to minor offences. This act, or ordinance as it was styled, was especially aimed at Biddle; and he must certainly have been the first victim to it but from an opposition which was raised to it in the army; and this circumstance, aided by the dissensions in parliament concerning it, caused the ordinance to remain inoperative. His confinement continued with unabated strictness until after the death of Charles, when through the influence of Cromwell and Fairfax a relaxation of the penal laws relating to religion took place. Favoured by these changes, Biddle was released from prison under certain conditions, and retired into Staffordshire, where he was hospitably received into the house of a justice of the peace, who not only made him his chaplain and procured him a congregation, but at his death left him a legacy. His retirement was disturbed by Bradshaw, president of the council, who being informed of it remanded him to prison. The loss of freedom during his long confinement was hardly a greater hardship than the loss of his friends, who were alienated from him by the odium cast upon him by the charge of heresy and blasphemy; not a single divine, except Dr. Gunning, afterwards bishop of Ely, paid him a visit while

in prison. His funds being exhausted, he was exposed to severe privations, but was unexpectedly relieved by some pecuniary assistance which he obtained for correcting the press for a Greek Septuagint, then being printed by Roger Daniel, in London, an employment for which he was singularly qualified.

In 1651 an act of indemnity and oblivion was passed by parliament, which included all heretical offences. To this measure Biddle was indebted for his liberty, after a confinement, with a short intermission, of seven years. The first use that he made of his freedom was to collect around him those friends and adherents whom his writings had brought over to his opinions. They met on the Lord's Day for the purpose of expounding the Scriptures, and gradually formed themselves into a society on this leading principle, namely, that "the unity of God is a unity of person as well as nature." The members of this society were called Bidellians, and from their agreement in opinion concerning the unity of God and the humanity of Christ with the followers of Socinus, they were sometimes denominated Socinians. The name adopted eventually by themselves was that of Unitarians. This was, indeed, the rise of the English Unitarians. Among the early members of this church was Nathaniel Stuckey, who published a translation of Biddle's 'Scripture Catechisms, for the use of Foreigners.' The publication of the two catechisms from which these translations were made brought the vengeance of government again upon their author. He was summoned to the bar of the House of Commons, and on his refusal to criminate himself, was committed to close confinement in the Gate-House. When Cromwell dissolved the parliament, Biddle again obtained his liberty, after ten months more imprisonment; but his book shared the fate of his former tract, being publicly burnt. Twelve months had scarcely elapsed after this release, when in consequence of an information lodged against him, on account of some expressions used in a public discussion with Mr. Griffin, a Baptist minister, he was committed to the Compter, July 3, 1655. From this prison he was removed to Newgate, and tried for his life on the ordinance against blasphemy and heresy. His trial was conducted with such indecent haste and such a total disregard to justice, that Cromwell himself interfered, and, in order to baffle the designs of the prosecutors without seeming to yield too much to the more tolerant party, he banished Biddle to Star Castle, in St. Mary's, one of the Scilly Isles, with an annual subsistence of a hundred crowns. In this state of exile he continued for three years, when the solicitation of his friends and change of circumstances induced the Protector to grant a writ of 'habeas corpus,' under which he returned, and no charge being preferred against him, he was set at liberty. He then became the pastor of an Independent congregation in London, the duties of which office he faithfully discharged until the elevation of the Presbyterian party, after the death of Oliver Cromwell, induced him to withdraw into the seclusion of the country. The sudden dissolution of that parliament brought him again to London, where he remained till the restoration of Charles II. Biddle tried to evade the threatening storm which fell upon all who dissented from the Episcopalian mode of worship, now re-established, by retiring from public duty, but his caution was unavailing. On June 1, 1662, he and the friends who met with him privately for worship were apprehended and taken to prison: they were fined in 20*l.* each, and Biddle himself in 100*l.* Not being able to pay this penalty, he was remanded to prison, where, in less than five weeks, through the pestilential atmosphere of the place and want of exercise, he contracted a disease which terminated his life, September 22, 1662, in the forty-seventh year of his age. During his exile he drew up an essay to explain the Apocalypse; and in 1663 he published several small pieces, translated from the works of the Polish Unitarians, among which was Przypocivius's 'Life of Faustus Socinus.' All his contemporaries describe him as a man of irreproachable life; and Anthony Wood, who had no great love for heretics, said of him, that "except his opinions, there was little or nothing blameworthy in him."

(Toulmin, *Life of Biddle.*)

BIDLOO, GODEFROID, an anatomist, was born at Amsterdam, in 1649. He first studied surgery, which he practised with great success, and was at one time surgeon to the forces. Afterwards he took the degree of Doctor of Medicine, and was appointed physician to William III., king of England, upon whose recommendation he was in 1694 made professor of anatomy and surgery in the university of Leyden.

In 1685 Bidloo had published at Amsterdam, in one volume folio, 105 plates, representing the anatomy of different parts of the human body, which were admirable as works of art, having been engraved by Lairese, but in many instances were deficient in accuracy. This work was reprinted at Leyden in royal folio, with 114 plates, and again at Utrecht in 1750, with a supplement. Bidloo accused Cowper, an English anatomist, of having reprinted it without acknowledgment, and with only a few alterations. In this charge there was considerable truth, and Cowper made in reply a very lame defence. Bidloo also carried on with much asperity a controversy with Frederick Ruysch, who exposed several of the errors in his works. Among the other writings of Bidloo are: 'De Anatomie Antiquitate Oratio,' Leyden, 1694, being his inaugural discourse, when he took possession of the chair of surgery and anatomy; 'Observationes de Animalculis in Hepate Ovillo et aliorum Animalium detectis,' 4to, 1698; 'Exercitationum Anatomico-Chirurgicarum Decades Duz,' 4to, 1703, in which

occur several important remarks on surgical diseases; and 'Opuscula omnia Anatomico-Chirurgica edita et inedita,' 4to, with plates, 1715. Bidloo died in 1713, in the sixty-fourth year of his age. He had a brother named Lambert, who wrote on botany; and a nephew Nicolas, who became physician to Peter the Great.

BIELA, WILHELM, BARON VON, was born at Rosla, near Stolberg, in the Harz Mountains, in Prussia, his patrimonial estate, on March 19, 1782. When he was born Stolberg was an independent state, and he entered young into the Austrian army. He had taken an early predilection for astronomy, as an amateur, and while serving with his regiment at Josephstadt in Bohemia, in 1826, he became distinguished by the first discovery of the comet since called after him. Retiring from the military service, he continued to take an interest in the science of astronomy, and corresponded with many of the most eminent men of science. He died on February 13, 1856, at Venice.

BILDERDYK, WILLEM, ranked by his countrymen among the first, by some as the very first modern poet and writer of Holland, and also distinguished by his varied erudition, was born at Amsterdam in 1756. His studies at Leyden took a very extensive range, for besides philology and languages—most of the modern languages included—he applied himself to history, archæology, jurisprudence, divinity, medicine, and geology; and appears, in short, to have left scarcely any branch of science untouched. It was in the character of poet however that he made his début in 1776, when his 'Invloed der Dichtkunst,' &c. ('The Influence of Poetry on States and Governments'), obtained the prize from the Leyden Society of Kunst door Arbeid. Bilderdyk's poem was in some degree a foreboding of his future career, which, it must be confessed, was rather too much in accordance with the motto of his first Leyden patrons—"Kunst door Arbeid," or 'Art through Industry,' since, though his productions manifest great industry, ability, and superior mastery of language, he rarely soars into the more elevated regions of imagination.

His poem on the 'Love of Fatherland' obtained him a second prize the following year; and in 1779 he published his translation of the 'Edipus Tyrannus' of Sophocles, intended to exhibit to his countrymen the genuine form and spirit of Greek dramatic poetry, in opposition to the spurious classicality of French models, by a servile imitation of which they had enervated both their language and their taste. About 1783 he began to practise at the bar at the Hague, yet without renouncing his literary occupations, for it was about the same time that, in conjunction with Feith, he undertook not merely to re-edit and illustrate with an historical commentary Van Haren's 'Geuzen,' but to reshape the work itself by dressing it up in more poetical language—treatment not a little singular for a contemporary production whose author was just dead. Thus renovated, the poem first appeared in 1784. Towards the end of 1786 the unsettled state of public affairs induced Bilderdyk to quit Holland and seek an asylum in Germany, where he supported himself by teaching, as he did subsequently in England. This self-imposed exile lasted nearly twenty years, during the first half of which his muse was silent. It was not till 1799 that he produced two volumes of miscellaneous pieces entitled 'Mengelpoesie,' containing a poem on astronomy and some translations from Ossian. In 1803 first appeared his 'Buitenleven,' or 'Rural Life,' which is considered by some almost as his masterpiece; yet it has no claim to originality, being no more than a free and spirited imitation of Delille's 'L'Homme des Champs.' The same may be said of a subsequent translation by him of the whole of 'Fingal.' On his return to Holland he was received as one whom the nation had reason to be proud of, and was taken into favour by Louis Napoleon (then just made King of Holland), who was desirous of rendering himself popular with his new subjects, and appointed Bilderdyk his instructor in the Dutch language, and president of the Institute founded by him at Amsterdam, upon the model of the French one. He was thus all at once placed in comparatively prosperous circumstances, and his literary reputation was not a little increased also by his 'Ziekte der Geleerden' (the Maladies of Literary Men), a subject equally repulsive and unpoetical, but so treated as to be of powerful though painful interest. He next attempted tragedy, and produced several pieces of the kind, which, although unsuccessful upon the stage, are marked by great poetical beauties. They were published in 1803, in three volumes, and among them are two by his wife, namely, 'Elfrida,' and 'Iphigenia in Aulis.' In 1809 he was thrown into great affliction by the loss of several of his children, and in the following year the abdication of Louis Napoleon deprived him of his pension, and he was again in very embarrassed circumstances, and so continued till the return of the Prince of Orange, when they began to improve. A year or two afterwards he removed to Leyden, where, as he had done all along, he continued to put forth one new production of his muse after another. The noblest of them all however, his 'Ondergang der Eerste Wereld,' or 'Destruction of the First World,' did not appear till a later period. So far from betraying any decline of intellectual power, this fine poem displays more of imagination and invention than any of his former ones; but unfortunately he proceeded no further than with five books of it. On the 16th of April he lost his second wife, Catherina Wilhelmina, a lady of considerable literary attainments: besides the two tragedies already mentioned, she wrote, among other things, a poem on the battle of Waterloo, and translated Southey's 'Roderic.' Bilderdyk did not survive her very

long, for he died at Haarlem in the following year, December 18, at the age of seventy-five. Among the numerous manuscripts he left behind him was a history of Holland, which has since been edited by Tydemann.

BINCK, JACOB, a celebrated old German engraver and painter, and one of the so-called little masters, was born about 1500, in Cologne; some authorities make him, incorrectly, a native of Nürnberg. He however lived some time in Nürnberg, and was probably the pupil of Albert Dürer. Sandrart says he studied with Marcantonio at Rome; but all the accounts of him are little better than conjectures. In 1546 Binck appears to have been living at Copenhagen as portrait painter to Christian VIII. of Denmark. Later he was living at Königsberg in the service of Duke Albert of Prussia, who sent him in 1549 on a commission to the Netherlands. In 1550 he was employed again by Christian VIII., to select a fit spot for the erection of a fortress in Holstein. He died probably at Königsberg, in the service of Albert of Prussia, about 1560.

Bartsch describes ninety-eight prints by Binck, including one woodcut. There are many other prints attributed to him, which are marked J. B., but these according to Bartsch belong to some other artist, who probably is the same who studied, according to Sandrart's account, at Rome. Binck's monogram is made of J. C. and B. intermingled, the C. signifying Coloniensis, 'of Cologne'; in one print the word Coloniensis is written in full. Many of his prints have been copied with a view to profit by the deception, as is the case with the works of other celebrated masters. Binck's drawing is superior to that of the little masters generally, but his style is very similar to that of Barthel B-ham.

(Heineken, *Dictionnaire des Artistes, &c.*; Huber, *Manuel des Amateurs, &c.*; Meusel, *Neue Miscellaneen Artistischen Inhalts*, No. 8; Bartsch, *Peintre-Graveur*; Brulliot, *Dictionnaire des Monogrammes, &c.*)

BION, a name common to many Greek authors, more or less known to the moderna. They are usually distinguished by their ethnical names. Clemens Alexandrinus ('Strom.' vi. p. 629, A.) mentions a BION PROCONNESIUS, who wrote an abridgment of the work of Cadmus the historian, and he is probably the person cited by Athenæus (II., p. 45): according to Diog. Laert. (iv. 58) he must have lived about the middle of the 6th century B.C., being a contemporary of Pherecydes of Syros.

BION BORYTHENITES was a philosopher, who seems to have belonged to nearly all the different sects in succession. He was born some time near the 120th Olympiad, and is supposed to have died about B.C. 241, Olymp. 134. 4. He is mentioned by Strabo (i. 15) as a contemporary of Eratosthenes, who was born B.C. 275, and of Zeno the Stoic, who died B.C. 263 (Comp. Athenæus, iv. 162, D.). His father was a freedman, his mother a Lacedæmonian harlot, named Olympia. On account of some malpractices in his capacity of tax-gatherer, his father was sold with his whole family. Bion, who was then a child, was purchased by a rhetorician, who made him his heir, and after his patron's death he went to Athens, where he set up as a philosopher. He was first an auditor of Crates; then he turned Cynic; afterwards he attended the lectures of Theodorus, and finally became a disciple of Theophrastus. He was a great jester, and remarkable more for the point than for the good-humour of his witticisms. (Horat., 'Epist.' ii. 2, 60, and Cic., 'Tuscul.' ii. 26.) He died at Chalcis in Eubœa. (Diog. Laert., iv. 46-58.)

But the most celebrated person of this name is BION SMYRNEUS, the Bucolic poet; of whom however we know little more than that he lived at the same time with Theocritus and Moschus, of whom the former mentions him in his poems, and the latter has written an elegy on his death. He died by poison. An attempt was made many years ago by Giovanni Vintimiglia to deprive Smyrna of the honour of his birth, and to prove that he was born in Sicily, where he undoubtedly spent a great part of his life (Lorenzo Crasso, 'Historia de Poeti Greci,' p. 90); but not only is his name mentioned by Moschus in connection with the Smyrnan river Meles, but we have also the express testimony of Suidas (voc. Θεόκριτος) that he was born at a village called Φλώσις, near that city. His longest Idyll is a lament over Adonis. Bion's poems are generally published along with Theocritus and Moschus. The best edition is that of L. F. Heindorf, Berlin, 1810. We are not acquainted with any good English version of Bion. There is a German translation by J. H. Voss, Tübingen, 1808.—Several other Bions are mentioned by Diogenes Laertius, but nothing is known about them.

* BIOT, JEAN-BAPTISTE, was born at Paris in 1774. From a term of study at the college Louis-le-Grand, he passed into the artillery; but soon abandoning the military service for scientific pursuits, he entered the École Polytechnique, and won such distinction by his diligence and ability as to be appointed professor of mathematics in the Central School at Beauvais. The way in which he fulfilled his duties, at an age when there is commonly more need to receive than ability to give lessons, the interest which he imparted to his lectures, and his skill in discovering new results and simplifying difficult questions, inspired great hopes of his future career. Nor have they been disappointed. While here, as he relates, "being full of ardour for geometry, and many things, I thought only of following with delight the inclinations of my mind towards all sorts of scientific studies, I had an inordinate ambition to penetrate into the highest regions of

mathematics." Unable to procure the scattered works of the great mathematicians, he wrote to Laplace, who was then publishing the first volume of his 'Mécanique Céleste,' requesting permission to read the proof sheets, in which he knew all the important results would be brought together. The request, at first refused, was granted on a second application; and the youthful professor thereby gained not only the advantage of revising the calculations for his own instruction, but the friendship of the illustrious geometer, whose house from that time became open to him, and whose counsels, patiently and even affectionately bestowed, were always ready in cases of difficulty.

Biot had taken up one of Euler's problems, which had never been directly solved; and one day he submitted to Laplace a method for its solution, and by his advice presented it to the Academy. At the next meeting the young man was permitted to draw his diagrams on the black board, and to read his paper to the assembled savants, who at its close felicitated him on its originality. Monge was delighted at the success of his former pupil. After the meeting Laplace invited Biot home, praising him on the way for the clearness of his demonstrations; and on arrival he took a paper from a closet in his study, and placed it in the young man's hands. It was already yellow with age; and what was his surprise on opening it to find the solutions for which he had just gained so much applause all worked out, and by the process of which he thought himself the inventor. Laplace had years before gone through the work, but checked by the same difficulties that stopped Euler, it was laid aside for future study; and with rare magnanimity he kept all knowledge of it from Biot until the latter had initiated his reputation before the Academy. He enjoined him moreover to silence; and the incident would have remained a secret, had not Biot himself revealed it fifty years afterwards.

The paper here in question, 'Sur les Équations aux Différences Mêlées,' is printed in the first volume of 'Mémoires' of the Institute ('Divers Savants,' vol. i., 1806). The report thereon, signed by Laplace, Lacroix, and Bonaparte, was presented at the meeting on the 21st Brumaire, only three days after the eventful 18th, which decided the fortune of Bonaparte. The consul was present at the meeting, as collected and tranquil as if occupied by nothing but mathematics.

In 1800 Biot was recalled from Beauvais, and appointed to the chair of natural philosophy in the College de France; a remarkable promotion for one only in his twenty-sixth year. He was now more favourably situated for scientific intercourse. One of his papers, written shortly after he left the Polytechnic School, appears in the 'Mémoires' (tom. iii. an. 9), entitled 'Considérations sur les Intégrales des Equations aux Différences finies,' by 'citoyen' Biot—the first of a long and valuable series of contributions. The succeeding volume contains his 'Rapport sur les Expériences du Citoyen Volta,' which recommends the award of the gold medal of the Institute to the discoverer of voltaic electricity.

Biot was elected a member of the Academy of Sciences—La Classe, as it was then called—in 1803. Soon afterwards he and Arago commenced an experimental inquiry—'Sur les Affinités des corps pour la lumière, et particulièrement sur les forces réfringentes des différens Gaz,' which was published in the 'Mémoires' for 1806. The same volume contains Biot's account of his journey to Aigle in the department of L'Orne, to verify a fall of meteorites. The facts have since remained data for the investigation of similar phenomena; and by their able elucidation many persons were first convinced that meteoric stones fall from the atmosphere.

In 1804 Biot accompanied Gay-Lussac in his first memorable balloon ascent. In 1806 he was chosen a member of the Bureau des Longitudes, and took part in the extension of the French arc of the meridian across Spain and to the island of Formentera. [ARAGO.] In 1814 he was made Chevalier of the Legion of Honour; and in the following year the Royal Society of London elected him one of their fifty foreign members.

The completion of the triangulation in the peninsula led to a wish for its extension to the north. The English arc, begun by General Roy, had been carried to the extremity of Scotland by Colonel Mudge; and the Bureau des Longitudes wished to have observations made along its line by Biot. "To desire a thing useful to science," says the latter, "was to anticipate the assent of the savants of England, and of the government of that enlightened country." On Biot's arrival in England, in May 1817, he was received with abundant cordiality by Sir Joseph Banks and other eminent philosophers. His instruments were passed at Dover under the seal of the Customs without search or delay, and conveyed without charge to Banks's residence. Every facility in short was rendered to Biot towards the accomplishment of his task. Colonel Mudge accompanied him to Scotland; and on the first station being chosen, at the fort of Leith, the commandant, Colonel Elphinstone, had a portable observatory built, and a base of heavy blocks of stone laid for the support of the instruments. "If my observations were bad," said Biot, grateful for the ready aid, "I had no excuse; it was entirely my own fault." While these observations were in progress, the opportunity was thought to be favourable for an extension of the arc to the Shetland Isles, 2 degrees more to the north than it had yet been carried. Biot was ready to assist; and all the materials and instruments having been shipped on board the 'Investigator,' brig of war, he sailed with Captain Richard Mudge for Lerwick on the 9th of July.

The little island of Unst was ultimately chosen as the station, from its being situated not only farther north, but also farther east, and consequently nearer to the line of Formentera. By the beginning of August the pendulum apparatus was set up within the solid protecting walls of a vacant sheep-fold, and the observatory, with its repeating-circle, in the garden of a resident proprietor, Mr. Edmonston, whose warm hospitalities made up for a chilly climate. What a change from the sunny islands of the Mediterranean! No trees; little vegetation besides grass and mosses; seldom free from fogs, hoarse winds, and angry seas. Captain Mudge had to leave in consequence of the ill-effects of the climate on his health, and Biot remained to carry on the work. A young native carpenter was trained into a competent assistant; and for two months such a series of observations was made as fully satisfied all requirements. The results were found to agree with theory; and when it is remembered that these results were obtained by a difference of less than three fourths of a line in the length of the pendulum between Formentera and Unst, some notion may be formed of the singular delicacy of the observations, and the consequent mental and bodily labour which they involved.

After Biot's return to Edinburgh he visited the manufacturing districts of England, the two universities, and met Arago in London. With him he repeated the observations on the measure of the second-pendulum at the Greenwich Observatory. Humboldt, who was then in England, took part in the work, "forgetting," to use Biot's words, "the multitude of his other talents to be only an excellent observer."

An account by Biot of his journeyings and labours while engaged in the triangulation, is given in the 'Mémoires de l'Académie Royale des Sciences, Année 1818,' tome 3. The same volume contains one of his papers on polarisation in crystalline bodies. To give a list of all his papers would fill whole pages; but there is one in the 13th volume of the 'Mémoires' (1835) deserving of especial notice—'Sur la Polarisation circulaire, et sur ses applications à la Chimie Organique.' In this he makes known his discovery of circular polarisation in a great number of solid and fluid substances never before examined; and, while adding largely to our knowledge of optical science, he points out a direct useful application of the remarkable phenomena—namely, of testing the quality of saccharine fluids. Instruments are now made which, when immersed in a liquid, indicate the quantity of sugar held in solution by the amount of rotation of the ray. They are used successfully in pharmacy to detect adulteration, and may be employed to denote the sugar in diabetic urine: an interesting example of a refined philosophical experiment being turned to practical uses in commerce and the arts.

In 1840 the Royal Society awarded their Rumford medal to Biot for his "researches in and connected with the circular polarisation of light." He is a member of three of the five academies which compose the Institute of France. He is a foreign member of the Royal Society of Edinburgh, of the Cambridge Philosophical Society, and of most of the academies and learned societies on the continent of Europe. Any list of his works would necessarily be incomplete, as the veteran still adds to their number; for he retains all the vigour and fertility of his intellect, and at meetings of the Academy he speaks with not less clearness and force than he writes.

On the establishment of the empire in 1804, Biot opposed any expression of opinion by the Academy, on the ground that the members constituted a scientific and not a political body; and in 1815, at the return of Napoleon I. from Elba, he voted against the 'acte additionnel' to the constitutions of the empire. He married, when in his 22nd year, the daughter of Brisson, the professor of natural philosophy and contemporary of Réaumur and Nollet. They had two children, a son and a daughter. The latter is now a grandmother; the son died in 1850, at the age of forty-seven, a member of the Académie des Inscriptions, and distinguished for his knowledge of Chinese.

Among traits of Biot's character may be mentioned his fondness for flowers. His study is always adorned with them; and it is said that when his wife, who was noted for her conversational powers, used to enter to talk with him, he would playfully form a barricade of flowers between her and himself.

Papers by Biot are to be found in the 'Mémoires de la Société d'Arcueil'; the 'Annales de Chimie et de Physique'; the 'Journal des Savants,' of which he is one of the directors; 'Mémoires de l'Institut'; and the 'Biographie Universelle,' articles Descartes, Franklin, Galilée, Leibnitz, and others. He has thrown great light on the history and practice of ancient astronomy; and as a reviewer, is remarkably able and apt in illustration. Among his other works are—'Analyse du Traité de Mécanique celeste,' 8vo, 1801; 'Essai sur l'Histoire des Sciences depuis la Révolution Française,' 8vo, 1803; 'Traité élémentaire d'Astronomie Physique,' 2 vols. 8vo, 1805; 'Recherches sur les Réfractions ordinaires qui ont lieu près de l'Horizon,' 4to, 1810; 'Traité de Physique expérimentale et mathématique,' 4 vols. 8vo, 1816; 'Recherches sur plusieurs Points de l'Astronomie Egyptienne, &c.,' 8vo, 1823; 'Recueil d'Observations géodésiques,' &c., 4to, 1821 (the history of the measurement of the arc aforementioned); 'Recherches sur la Polarité de la Lumière; Sur l'Astronomie chez les Anciens; Sur quelques Déterminations d'Astronomie ancienne, étudiées comparativement chez les Égyptiens, les Chaldéens, et les Chinois;,' and very many more.

BIRCH, THOMAS, an historical and biographical writer, was born in London, November 23rd, 1705. His parents were members of the Society of Friends, and his father carried on the trade of a coffee-mill maker, for which business the son was designed, but the strong desire which he displayed for reading and study overruled this intention. For several years he acted as teacher in different schools, and in all of them he sedulously applied to the pursuit of knowledge, stealing many hours from sleep for this purpose. His efforts were not without success, and in his twenty-fourth year being qualified to take orders, he was ordained in the Established Church without having attended either of the universities, a circumstance at that time much less frequent than at present.

He owed all his advancement in the church to the patronage of lord-chancellor Hardwicke, to whom he had been recommended early in life, and who never afterwards lost sight of him. In 1734 Birch was elected a Fellow of the Royal Society, and in 1752 he became one of its secretaries. In 1753 the university of Aberdeen conferred upon him the distinction of Doctor in Divinity; and he received a similar honour in the same year from Herring, archbishop of Canterbury. Dr. Birch was most active and indefatigable in his literary pursuits. Distinguished by unwearied industry, rather than by acuteness and discrimination, he accumulated in the course of his life a vast mass of materials of great value to those who possess a superior understanding without the doctor's spirit of laborious research. The first work of importance in which he was engaged was the 'General Dictionary, Historical and Critical.' It consisted of ten volumes in folio, and included a new translation of Bayle, besides a vast quantity of new matter. The first volume appeared in 1734, and the last in 1741. In 1742 he published 'Thurloe's State Papers,' in seven vols. folio. He published 'Lives of Archbishop Tillotson, and the Hon. Robert Boyle,' in a separate form, and edited new editions of their works; also a new edition of Milton's Prose Works, and the Miscellaneous Works of Sir Walter Raleigh. In 1744 he commenced a series of biographical memoirs of illustrious persons of Great Britain, for a work published in folio by Mr. Hawbraken and Mr. Vertue, two artists. Each memoir was accompanied by an engraving of the individual to whom it related. The work was published in numbers; the first volume was completed in 1747, and the second in 1752. In the list of his historical works are, 'An Inquiry into the share which King Charles I. had in the transactions of the Earl of Glamorgan;' 'A View of the Negotiations between the Courts of England, France, and Brussels, from 1592 to 1617, from original documents.' The same volume contained a 'Relation of the State of France, with the character of Henry IV.' In 1753 he published 'Memoirs of the Reign of Queen Elizabeth, from 1581 to her death.' In 1760, a 'Life of Henry Prince of Wales, eldest son of King James I.' His last biographical work was 'Letters, Speeches, Charges, and Advices of Lord Chancellor Bacon.' A Sermon which was preached before the College of Physicians, in 1749, appears to be the only one of his discourses which has been printed. Besides his multifarious labours for the press, he transcribed a great number of volumes in the Lambeth library. He also maintained an extensive correspondence. His biographer remarks, that Dr. Birch's habit of early rising alone enabled him to get through so much work. He found time in addition for the enjoyments of society. Dr. Birch was killed by a fall from his horse, between London and Hampstead, January 9th, 1766. He bequeathed his library and manuscripts to the British Museum, of which he was a trustee. The remainder of his property, amounting only to about 500*l.*, he left to be invested in Government Securities, the interest to be applied in increasing the stipends of the three assistant librarians at the British Museum.

BIRD, EDWARD, R.A., an excellent English 'genre' painter, was born at Wolverhampton in 1772. As he evinced a strong inclination for drawing, his father, who was a clothier, apprenticed him to a tea-board manufacturer of Birmingham, with whom it was Bird's business to paint the boards. At the expiration of the term of his indentures Bird resolved to try his fortunes in the world as an artist, and he accordingly set up as a drawing-master at Bristol. In 1807, when he was in his thirty-fifth year, he exhibited some paintings at Bath, which were much admired, and sold for thirty guineas each. These were succeeded by a piece called 'Good News,' which established his reputation. Other good works succeeded, as the 'Choristers Rehearsing,' and the 'Will;' the first was purchased by William IV., the second by the Marquis of Hastings, and the Royal Academy elected Bird an Academician. He now exhibited his masterpiece, the 'Field of Chyvy Chase the Day after the Battle,' which was purchased by the Marquis of Stafford for 300 guineas. The same nobleman purchased his next picture, the 'Death of Eli,' for 500 guineas, and he obtained by it also a prize of 300 guineas awarded by the British Institution. The picture however was not the artist's: it was the joint-stock property of three gentlemen of Bristol, who had commissioned Bird to paint it for 300 guineas, and the 500 for which the picture sold at the exhibition was divided among them. The profitable result of their speculation led them to give Bird a second commission, but the painter declined their further patronage.

In 1813 Bird was in London, and was introduced to the Princess Charlotte, who appointed him her painter; and he presented the princess with the 'Surrender of Calais,' one of his favourite pictures.

This visit to London produced a great change in his taste; no longer satisfied with the humble character of his usual subjects, he forsook the characteristics of rural and domestic life, in pursuit of the imaginary greatness of religious and historical subjects—the 'Fortitude of Job,' the 'Death of Sapphira,' the 'Crucifixion,' and the 'Burning of Ridley and Latimer,' and even the 'Embarkation of Louis XVIII. for France,' which at most could be but a costume show. This last undertaking was a great misfortune to Bird: he required the portraits of many persons of rank, native and foreign; the prevailing upon these persons to sit was a trouble and a difficulty which Bird had never contemplated, and he completely failed in his attempt. He died in 1819, in his forty-eighth year, leaving his pageant unfinished. He was buried with all the honours of the city in the cloisters of Bristol Cathedral. Three hundred gentlemen followed his body to the grave: his son, a child of seven years of age, was the chief mourner. But though at the desire of the citizens the funeral was a public one, the expense of it was left to be borne by his widow—a matter which subsequently led to much recrimination.

Of the kind of picture by which Bird gained his popularity, he executed several which have not been mentioned—as the 'Blacksmith's Shop,' the 'Country Auction,' the 'Gipsy Boy,' the 'Young Recruit,' 'Meg Merrilies,' the 'Game at Put,' and some of his earliest works, as the 'Village Politicians,' and the 'Poacher,' in six scenes.

(Cunningham, *Lives of the most eminent British Painters*, &c.)

BIRD, JOHN, a celebrated mathematical instrument maker, was born near the close of the 17th century. He was brought up a cloth-weaver in the county of Durham. What first occasioned him to turn his thoughts to the art in which he afterwards so much excelled was his accidentally observing, in a clockmaker's shop, the coarse and irregular divisions of the minutes and seconds on a clock dial-plate. He came to London in the year 1740, and began his career by dividing astronomical instruments both for Graham and Sisson, and afterwards carried on business in the Strand. His celebrated Greenwich quadrant was mounted February 16, 1750. Another instrument was erected in the Oxford Observatory. His last work was the mural quadrant for the *École Militaire* at Paris, with which D'Agelet and the two La Landes determined the declinations of 50,000 stars. In 1767 he received 500*l.* from the Board of Longitude, on condition that he should take an apprentice, instruct other persons as required, and furnish, upon oath, descriptions and plates of his methods. He died March 31, 1776, aged sixty-seven years.

BIRDE, WILLIAM, who is numbered among the most celebrated of our ecclesiastical composers, was born about the year 1540, and educated as one of 'the children' in the chapel of Edward VI., probably under the 'famous Thomas Tallis,' whose pupil he certainly was at an early period of his life. In 1563 he was chosen organist of Lincoln Cathedral, and in 1575, conjointly with Tallis, he became organist to Queen Elizabeth, as well as gentleman of her chapel. He died in 1623. Birde seems to have been highly esteemed, both in his private and professional capacity. That he was great in his art, at a time however when that art exhibited more of study than genius, his compositions afford indisputable evidence. His complete Service, together with three Full Anthems, published in Boyce's 'Collection,' prove his musical learning, which is further evinced in his 'Cantiones Sacre,' or sacred songs for many voices, printed, under letters-patent from Queen Elizabeth, in junction with his master Tallis, and republished a few years back by the Society of Musical Antiquarians. He also contributed largely to 'Queen Elizabeth's Virginal-Book,' "a magnificent folio manuscript curiously bound in red morocco," now in the British Museum, containing nearly seventy pieces for the organ and virginal. He also published other works, chiefly with Latin words, all of them displaying deep study, and a profound knowledge of florid counterpoint. But he is now generally known—is in fact well known everywhere—by his canon 'Non nobis, Domine,' a unique composition, which has rather gained than lost by the operation of time, formed as it is of materials so enduring, that in spite of the love of novelty, which in music is so influential, it has maintained its ground during nearly two centuries and a half. Some attempts have been from time to time made, particularly on the continent, to tear so valuable a leaf from Birde's laurels, but he is still left in full possession of this, his richest, never-fading ornament.

BIRKBECK, GEORGE, M.D., was born January 10, 1776, at Settle in Yorkshire, where his father was a merchant and banker. He displayed an early predilection for mechanical and scientific subjects, which led him to select the medical profession as his pursuit. He commenced his medical studies at Leeds, and at the age of eighteen repaired to Edinburgh, where he remained one session. The following winter he became a pupil of Dr. Baillie in London; but at its close he again went to Edinburgh, and at the termination of his fourth session took his degree. His reputation in the university was already considerable, and he had formed a friendship with Brougham, Jeffrey, Sidney Smith, F. Horner, and others who afterwards attained eminence. While at Edinburgh he was elected to the professorship of the Andersonian Institution at Glasgow, and in November 1799 commenced his first course of lectures there on Natural and Experimental Philosophy. There was at that time no maker of philosophical instruments at Glasgow, and he was obliged to have his philosophical apparatus made by ordinary workmen. He had employed a tinman to construct a

model of a centrifugal pump; and it was in the cellar which formed the workshop, while surrounded by the workmen who had made it, but were ignorant of its use, that he was first struck with the idea of giving a gratuitous course of lectures for the scientific instruction of the mechanics of Glasgow. In March 1800 he communicated his wishes on this subject to the trustees of the Andersonian Institution, who regarded the proposal as visionary, and nothing was done during the session. At its close Dr. Birkbeck returned to Yorkshire, and in preparing the prospectus of his course for the ensuing session, he announced his intention of establishing a class "solely for persons engaged in the practical exercise of the mechanical arts, men whose education in early life has precluded even the possibility of acquiring the smallest portion of scientific knowledge." In the style of these lectures he promised that he would study "simplicity of expression and familiarity of illustration." On his return to Glasgow a printed invitation was circulated in the different manufactories, which contained an offer of tickets for the admission of the most intelligent workmen in each manufactory into the mechanics' class at the Andersonian Institution. The number who accepted this offer was not large, and the first lecture was attended by only seventy-five persons; but it gave so much satisfaction, and excited such general interest, that at the second lecture the number was increased to two hundred; at the third lecture above three hundred mechanics were present, and at the fourth above five hundred; and as the theatre of the institution would not accommodate many more persons, it became necessary to limit the number of tickets. At the close of the course his class of mechanics presented him with a silver cup. Dr. Birkbeck continued his lectures to them for the two succeeding seasons. In 1804 he relinquished the professorship, and was succeeded by Dr. Ure.

In 1806 Dr. Birkbeck settled in London, where he soon obtained a good practice as a physician. While in active practice in London as a physician, Dr. Birkbeck had few opportunities of following up the labours which he had commenced at Glasgow for the advancement of scientific knowledge amongst artisans; but it was a subject which he had always at heart. In 1820 he gave a gratuitous course of seventeen lectures at the London Institution. In February 1823 the mechanics of Glasgow who attended the lectures at the Andersonian Institution, as a mark of respect for his character, and in gratitude to him as the 'liberal-minded projector and founder' of the mechanics class, asked his consent to allow his portrait to be taken. In July of the same year they resolved to establish a school for their own instruction, to be called the Glasgow Mechanics Institution. Many circumstances now tended to a general development of Dr. Birkbeck's favourite plans. In 1821 a School of Arts had been established at Edinburgh, through the exertions principally of Mr. Leonard Horner. In the 'Mechanics Magazine' for October 11, 1823, a paper appeared entitled 'Proposals for a London Mechanics Institute.' Dr. Birkbeck was at this time engaged in preparing an Essay on the Scientific Education of the Working Classes, and he wrote to the 'Mechanics Magazine' (of October 18th), offering information and every assistance in his power in the formation of the projected institution. He was soon actively engaged in this object, and on the 11th of November 1823, presided at a public meeting at the Crown and Anchor, which was attended, amongst others, by Dr. Lushington, Jeremy Bentham, David Wilkie, and Cobbett; Lord Brougham, who had attended the preliminary meetings, was absent from other engagements. After another meeting, on the 2nd of December, the first officers of the 'London Mechanics Institution' were appointed on the 15th of December. Dr. Birkbeck was elected president, which office he filled till his death. At the formation of the institution Dr. Birkbeck generously lent the sum of 3700*l.* for the purpose of building a lecture-room, &c. On the 20th of February 1824 he delivered an inaugural address on the opening of the institution.

Dr. Birkbeck's professional and scientific pursuits, and his services in various ways, in connection with objects of public utility, were continued to the last. He died December 1, 1841, at his residence in Finsbury-square, London, of a severe internal disease which occasioned great suffering. He left a son by his first wife, and two sons and two daughters by his second wife, who survived him. His funeral was attended by a large procession of the working-classes, the members of the Mechanics Institute and other societies, the committee of the Polish refugees and a number of Poles; and among the private carriages was that of the Turkish ambassador; altogether about a thousand persons were present.

BISHOP, SIR HENRY ROWLEY, was born in London in 1780. He received his musical education under Signor Bianchi, who was then settled in London as composer at the Opera House. In 1806 Mr. Bishop obtained the appointment of composer of ballet music at the opera, a post he occupied for some time; but little more than the titles of the pieces written by him have been preserved. The first of his long series of English operas, 'The Circassian Bride,' was produced at Drury Lane Theatre on the 23rd of February 1809, with great success; but on the following evening the theatre was destroyed by fire, and the score of his opera perished in the flames. For the next sixteen or seventeen years he wrote almost incessantly for Drury Lane and Covent Garden theatres, at the latter of which he for several years held the office of composer and musical director. During this period he is said to have produced upwards of seventy operas, ballets, and

musical entertainments. Of these many are forgotten; but others are still repeated, and, on account of their flowing melodies and animated style, are, when tolerably played, always heard with genuine pleasure. Those which best illustrate his style are 'Guy Mannering,' the 'Slave,' the 'Miller and his Men,' 'Maid Marian,' 'Native Land,' the 'Virgin of the Sun,' the 'Knight of Snowdon,' the 'Englishman in India,' &c., in all of which there is true musical power. He also 'composed and adapted' Mozart's 'Barber of Seville,' 'Marriage of Figaro,' &c. But the incessant calls upon him begot a hasty careless manner, and he frequently, in the later years of his connection with the theatres, contented himself with crude rifacimentos of the scores of foreign composers; and his fame in consequence gradually declined. At length, aroused by the production of Weber's 'Oberon' at Covent Garden Theatre, in 1826, he composed 'Aladdin' in direct rivalry to that famous work, and brought it out at the same time at Drury Lane. But instead of trusting to his own genius, 'Aladdin' was a direct attempt in the German style, and it proved an entire failure. Mortified at his loss of popularity, he never again composed for the stage. Besides his theatrical pieces, he composed three or four shorter pieces for a series of oratorios, which he conducted about 1819-20. He arranged also several volumes of the 'National Melodies;' and he composed and arranged all Moore's 'Melodies' subsequent to Stevenson's secession from that publication.

Sir Henry Bishop was knighted in acknowledgment of his musical eminence by the Queen soon after her accession to the throne. He was one of the first directors of the Philharmonic Society, and conductor of the Concerts of Ancient Music. He was also Reid professor of music at Edinburgh; and in 1848 was elected professor of music at Oxford University. He died April 30, 1855, aged seventy-five. Sir Henry had heavy domestic trials, and he was not prudent in money matters; so that his later years were clouded by much anxiety and suffering.

Bishop was one of the first English composers of modern times. Had he written less he would have written better; but as it is, though few if any of his operas are likely to retain a permanent place on the stage, and his elaborate imitative philharmonic cantatas have long been forgotten, much of his chamber and concert music—married as it so often is to immortal verse—will long continue to delight the public ear, and will indeed most likely be still popular when many far more pretentious pieces of foreign as well as home growth shall have passed away with their novelty. Many of his songs and glees have the truest inspiration of that class of music—flowing, vivid, graceful, and free from all affectation.

(*Dictionary of Musicians; Athenæum, 1855; Gentleman's Magazine, 1855.*)

BITON, a Greek writer about the time of Archimedes. A work by him on the construction of catapultæ is extant, in the collection of Thevenot; he mentions another work which he wrote, on Optics, which is lost.

BIZARI, PETER, a considerable poet and historian of the 16th century, was born at Sasso-ferrato, near Ancona, in Umbria or Spoleto, within the States of the Church. He was one of those who, having embraced the doctrines of the Reformation, were forced to leave their native country to escape the cruelties which followed on the establishment of the Inquisition in the Papal States. After spending some time at the court of London, he went to Scotland, where he was honourably received by Queen Mary and the Earl of Murray, who had then the chief direction of the government. Bizari informs us that Mary presented him with a chain of gold; and he has addressed one of his works to that princess. ('*Varia Opusc.*' fol. 28 A.) At what time he was in Scotland does not precisely appear; but in a poem inscribed 'Ad Jacobum Stuardum Scoticum,' he celebrates the victory which that nobleman gained over the Earl of Huntly, in such terms as to lead to the inference that he was then in Scotland. (*Ibid.* fol. 93 A.) The battle of Corrichie, in which Huntly fell, was fought in October 1562.

Andrew Melville, the celebrated Scottish reformer, when at the University of St. Andrews, was introduced to Bizari, who expressed his high opinion and warm regard for him in a dodecastichon of elegant Latin poetry, which, with several of Bizari's minor poems, is inserted in Gruter's 'Deliciæ Poetarum Italorum.' Mackenzie, Chalmers, and other Scottish writers, have confounded Bizari with a person whom they describe as Peter or Patrick Bisset, Bisset, or Bissart, born and educated in Scotland, and afterwards professor of the canon law in the University of Bologna, and the author of 'P. Bissarti opera omnia, viz. Poemata, Orationes, Lectiones feriales, et lib. de Irregularitate,' Venetiis, 1565.

Bizari was the author of several works of merit:—'*Varia Opuscula*,' containing various tracts and speeches, and two books of poems, published at Venice in 1565; 'A History of the War in Hungary, with a narrative of the principal events in Europe from 1564 to 1568,' Lyons, 1569: this work was afterwards translated by the author from the Italian, in which it first appeared, into Latin, and published in 1578. 'An Account of the War of Cyprus between the Venetians and Selim of Turkey,' in Latin, Bale, 1573; Antwerp, 1583. 'Epi-tome Insignium Europæ Historiarum,' Bale, 1573. 'Annals of Genoa, from 1573 to 1579,' published in Latin at Antwerp the latter year. 'Reipublicæ Genuensibus leges novæ, nunc in lucem editæ,' 1576: this

work was reprinted by Groevius in his 'Thesaurus Antiq. Italia;' tom. i.; as was also 'Dissertatio de Universo Reipublicæ Genuensibus statu et administratione,' Antwerp, 1579. 'A History of Persia,' in Latin, 1583; in speaking of which, Boxornius calls Bizari "gravissimum rerum Persicarum scriptorem." Giacobilli, in his 'Catal. Script. Prov. Umbrise,' makes mention of another work of Bizari's, entitled 'De Moribus Belgicis.'

(Mazzuchelli, *Gli Scrittori d'Italia*, tom. iv. p. 1295; Tiraboschi, *Storia della Letteratura Italiana*, tom. xi. p. 1009; Verdier, *Bibl. Francoise*, tom. v. p. 236; *Dict. Univ. Historique*; McCrie, *Life of Melville*, vol. i. pp. 16, 17.)

BLACK, JOSEPH, was born in France on the banks of the Garonne in the year 1728. His father, though a native of Belfast, and also his mother, were of Scotch descent. In 1740 Joseph Black was sent to Belfast, and six years afterwards to the University of Glasgow, where he continued his studies with great assiduity and success, devoting his attention chiefly to physical science. Having chosen the profession of medicine, he went to complete his medical studies at Edinburgh in 1750 or 1751: he had previously had the advantage of attending Dr. Cullen's lectures on chemistry at Glasgow. This science, in which he was destined to act so important a part, strongly excited his attention, and he pursued it experimentally with great vigour and commensurate success.

The chemical subject which seems first peculiarly to have excited his attention was the causticity of lime; a property till then supposed to be due to the absorption by the lime of some igneous agency. He placed the question on a scientific basis, by ascertaining the chemical difference between quick lime and other forms of the carbonate. Black wrote in 1754 an inaugural thesis on the subject, 'De Acido a cibus orto et de Magnesiâ,' and a treatise entitled 'Experiments on Magnesia, Quicklime, and other Alkaline Substances,' in 1755, in which his views were much more fully developed. In 1756 he was appointed professor of anatomy and lecturer on chemistry in the University of Glasgow, where he continued till 1766, when he was appointed to the chemical chair in Edinburgh. Between the years 1759 and 1763 he matured the speculations on heat which had for a long period occasionally occupied his thoughts. Boerhaave has recorded an observation made by Fahrenheit, that water would become considerably colder than melting snow, without freezing, and would freeze in a moment if disturbed, and in the act of freezing emitted many degrees of heat. This notice seems to have supplied Dr. Black with some vague notion that the heat received by ice during its conversion into water is not lost, but is contained in the water. He instituted a train of careful experiments on this subject, which bore out his idea; in the melting of ice, and in the boiling of water, there is a large amount of heat absorbed, which is not sensible to the thermometer, and is therefore named by him 'concealed' or 'latent' heat. It was this discovery that mainly urged Watt to the adoption of improved arrangements in the steam-engine.

Black wrote a paper in the 'Philosophical Transactions' on the freezing of boiled water; and another in the Edinburgh 'Transactions' on the hot springs of Iceland. He was never married. He died November 26, 1799, in his seventy-first year.

As a lecturer, Black was thus characterised by Dr. Robison ('Preface' to Black's 'Lectures on the Elements of Chemistry'):—"He became one of the principal ornaments of the University; and his lectures were attended by an audience which continued increasing from year to year, for more than thirty years. It could not be otherwise. His personal appearance and manners were those of a gentleman, and peculiarly pleasing. His voice in lecturing was low, but fine; and his articulation so distinct, that he was perfectly well heard by an audience consisting of several hundreds. His discourse was so plain and perspicuous, his illustration by experiment so apposite, that his sentiments on any subject never could be mistaken even by the most illiterate; and his instructions were so clear of all hypothesis or conjecture, that the hearer rested on his conclusions with a confidence scarcely exceeded in matters of his own experience."

BLACKLOCK, THE REV. THOMAS, D.D., a divine of the Established Church of Scotland, and a writer of poetry, was born at Annan in 1721. Before he was six months old he lost his sight, and it was partly to this misfortune that he owed his future distinction. Being precluded from the usual enjoyments of youth, he imbibed a stronger love of learning, which his father, who was a tradesman of an intelligent mind, took pains to gratify by reading to his son the works of the best authors. His father did not possess the means of giving his son a liberal education, but notwithstanding this disadvantage his intellectual progress was very rapid, and the mental concentration which his loss of sight occasioned became habitual to him. At an early age he acquired some knowledge of the Latin language from his more fortunate companions who attended the grammar-school; and in his twelfth year he produced verses which indicated considerable talent. When he had reached his twentieth year his sister was united to a man above her own rank of life, and young Blacklock now enjoyed the advantage of mixing with more intelligent society. His father's death, which occurred not long afterwards, appears to have greatly affected him. In a poem entitled 'A Soliloquy,' written after the death of his father, Blacklock expresses himself with much feeling, but with piety and resignation, on his helpless condition. Having

been introduced to Dr. Stevenson, a physician of Edinburgh, this gentleman was so much struck with Blacklock's talents that he offered to take upon himself the charge of his education; and in consequence of this liberality he commenced his studies at the Edinburgh Grammar school in 1741, but they were interrupted in 1745 by the Rebellion, when he returned to his friends at Dumfries. He had in this interval made gratifying progress, had published a volume of poetry, and having been introduced to the family of the lord provost, whose wife was a native of France, he had acquired the French language during the intercourse to which it led. When affairs had resumed their ordinary course, he returned to Edinburgh, and continuing his studies for six years longer, made himself master of the Greek, Latin, and Italian languages. He was, in addition, a proficient in music, of which he was particularly fond. In 1754 a second edition of his poems was called for, and a quarto edition was published in London by subscription in 1756, when David Hume and Mr. Spence, professor of poetry at Oxford, particularly exerted themselves to promote his interests.

Having completed his studies at the University, he was licensed in 1759 as a preacher of the Gospel. In 1762 he married, and immediately after was ordained minister at Kirkcudbright, in consequence of a crown presentation. Owing however to the hostility of his flock to this mode of church patronage, and also to the style of his preaching, he gave up the living after having held it two years, amidst circumstances very painful to his sensitive mind. The small annuity which he accepted in its place was scarcely sufficient for his support, and in retiring to Edinburgh in 1764, he opened his house for the reception of a few young gentlemen as boarders, to whose studies and improvement he directed his attention with much success. In this position he continued for twenty-three years, until 1787, when the state of his health induced him to withdraw from these duties. He died after about a week's illness, July 7, 1791. The degree of Doctor of Divinity had been conferred on him in 1766 by the University of Aberdeen. In private life Dr. Blacklock was distinguished by the great mildness and gentleness of his disposition, which not even the nervous irritability to which he was subject could affect, by his ardent love of knowledge, and by the simplicity and modesty of his character. His poetry will be read or referred to on account of the peculiar circumstances under which it was written. It is marked by a vein of placid elegance, but is wanting alike in vigour of thought and force of imagination.

Dr. Blacklock was not only a poet but a writer on philosophy and theology. The following is a list of his works:—'An Essay towards Universal Etymology, or the Analysis of a Sentence,' 8vo, 1756. 'The Right Improvement of Time,' a sermon, 8vo, 1760. 'Faith, Hope, and Charity Compared,' a sermon, 1761. 'Paraclesis, or Consolations deduced from Natural and Revealed Religion, in two dissertations; the first supposed to have been written by Cicero, now rendered into English; the last originally composed by Thomas Blacklock, D.D.,' 1767. 'Two Discourses on the Spirit and Evidences of Christianity,' translated from the French, and published in 1768 without his name. 'A Panegyric on Great Britain,' a poem, 8vo, 1773. 'The Graham,' an heroic poem, in four cantos, 4to, 1774. In 1793 a posthumous edition of his poems was published by Mackenzie, author of the 'Man of Feeling,' with a Life of Blacklock. In addition to the Lives by Spence and Mackenzie, the Life of Blacklock has been written by Dr. Anderson and Mr. Gordon.

BLACKMORE, SIR RICHARD, a physician, poet, and miscellaneous writer, was the son of an attorney at Corham, Wilts, and was born about the year 1650. In his thirteenth year he was sent to Westminster school, whence he proceeded to Oxford, where he remained thirteen years. After this it is said that he was for some time employed as a schoolmaster. He then made a tour on the continent, in the course of which he took the degree of M.D. in the University of Padua. On his return to England he was chosen Fellow of the Royal College of Physicians, and commenced practice in the metropolis. His attachment to the principles of the Revolution procured him the appointment of physician to William III, and he was for some time one of the court physicians in the succeeding reign. He wrote several medical treatises, none of which are in any way remarkable, except perhaps one on the small-pox, in which he combated the practice of inoculation. He also published an historical work: 'A true and impartial History of the Conspiracy against King William in 1695.'

The numerous poems which Blackmore wrote are now nearly forgotten. His 'Prince Arthur,' an heroic poem in ten books, reached a third edition in 1696. The following year he published 'King Arthur,' another heroic poem in twelve books. Both these poems were published in folio. Besides the above, he wrote 'Eliza,' a poem in ten books, also printed in folio; 'the Redeemer,' a poem in six books; and 'King Alfred,' a poem in twelve books. Dr. Johnson remarks that "the first of his epic poems had such reputation as enraged the critics; the second was at least known enough to be ridiculed; the two last had neither friends nor enemies." In 1700 he published 'A Paraphrase on the Book of Job, and other parts of Scripture;' in 1716, two volumes of 'Essays;' in 1718, a 'Collection of Poems,' in one volume; and in 1721, 'A new version of the Psalms of David, fitted to the Tunes used in Churches.' In a paper addressed to the king, and signed by the two archbishops and fifteen of the

bishops, this work was strongly recommended on account of its agreement with the original Hebrew, and its clearness and purity of English style." In 1721 and 1725 he wrote in opposition to Arianism; and in 1728 he published a work entitled 'Natural Theology, or Moral Duties considered apart from Positive; with some observations on the desirableness and necessity of a Scriptural Revelation.' The 'Accomplished Preacher, or an Essay upon Divine Eloquence,' was published at his express desire after his death, which took place October 8, 1729.

Never perhaps was any writer the object of such general attack by his contemporaries as Sir Richard Blackmore. Nearly all the wits of his day seem to have joined in this confederacy. One topic of abuse against him was that he lived in Cheapside, whence he was sometimes called 'the Cheapside Knight,' and 'the City Bard.' Sir Samuel Garth addresses him as "the merry poetaster at Sadler's Hall in Cheapside." He was considered, 'par excellence,' as the poet of dulness. In spite of these raileries he continued to put forth his 'heroic poems,' which display little art either in their plan or composition, and as little imagination. His professed object being "to engage poetry in the cause of virtue," he seems to have imagined that the graces of language were unworthy of his attention; and, confident in his own powers, he continued his course, regarding the attacks of his opponents with comparative equanimity. The intention of his 'Satire upon Wit' was to castigate the authors of works of an immoral tendency, and he took this opportunity of retaliating on his assailants. He always reprehended with severity the licence of the stage, and, though no puritan, lamented the licentiousness which succeeded the Restoration. It was probably this course, rather than the alleged dulness of his writings, that occasioned the ridicule of the day to be so strongly directed against him. The 'Creation,' a philosophical poem, is not undeserving of commendation; indeed there are several important testimonials in its favour. Addison states that it was "undertaken with so good an intention, and executed with so great a mastery, that it deserves to be looked upon as one of the most useful and noble productions in our English verse." Dr. Johnson, in his 'Life of Blackmore,' says that if he had written only this poem it "would have transmitted him to posterity among the first favourites of the English Muse." At a later day, Cowper, although he confesses that Blackmore has "written more absurdities in verse than any writer of our country," acknowledges that "he shines in his poem called the 'Creation.'" Since this opinion was expressed this poem has been gradually sinking into the neglect which Blackmore's other writings experienced much sooner.

In November 1713, Sir Richard commenced a periodical paper called the 'Lay Monk,' which appeared three times a week. He was induced to undertake this publication from a belief that he could do good by it; but it only reached forty numbers. It may be mentioned to his credit, that the purity of his private character was never once called in question by his most bitter critics. His temper was serious, and he was a firm supporter of what he considered the interests of virtue and religion.

BLACKSTONE, SIR WILLIAM, an English judge, is best known as the author of 'Commentaries on the Laws of England.' He was born in London, July 10th, 1723, a few months after the death of his father, who was a silk-mercant; he also had the misfortune to lose his mother at an early age. His education was carefully superintended by an uncle, who sent him, when about seven years old, to the Charterhouse, where at the end of five years he was placed on the foundation. At the age of 15 he was at the head of the school; and in his 16th year he removed to Pembroke College, Oxford. Having selected the law as his profession, he entered the Middle Temple, on which occasion he wrote the verses entitled 'The Lawyer's Farewell to his Muse,' which were printed in Dodsley's 'Miscellany.' He had displayed some ability as a writer of small pieces, and also had obtained a gold prize medal for verses on Milton. In 1743 he was elected Fellow of All Souls College, Oxford, and three years afterwards was called to the bar. After an experience of seven years in the courts at Westminster, during which he discovered that his talents were not calculated to ensure him any very eminent professional rank, he withdrew to his fellowship at Oxford, intending to lead an academic life. In 1749 he was appointed recorder of Wallingford, Berks, on the resignation of his uncle.

As the University of Oxford did not afford facilities for studying the principles of the English constitution and laws, he resolved upon supplying the deficiency by a course of lectures. This course opened in Michaelmas Term 1753, and was so well received that it was repeated with additions for several years. The advantage of rendering such a course of lectures permanent being fully demonstrated, a gentleman named Viner left by will a provision for this purpose. In 1758 Blackstone was appointed the first Vinerian professor, and from the assiduity with which he discharged the duties of the situation he attracted a large class of students. Having been requested to read his lectures to the Prince of Wales, Blackstone declined the honour, as he did not think himself at liberty to break his engagements with his class at Oxford; however, he sent copies of many of the lectures to be read to the young prince.

Having been engaged as counsel in a contested election (for he occasionally practised), the right of copyholders to vote came under

his consideration, which circumstance led him to publish his opinions on this question. He denied their right; and the enemies of popular privileges being glad to find themselves thus supported, the consequence was an act of parliament taking away the franchise from this description of electors.

The popularity of his lectures, together with the publication of a new edition of the 'Great Charter and Charter of the Forest,' accompanied by an historical preface, prepared the way for his return to the law courts in the metropolis, where he was soon engaged in extensive practice. He entered parliament in 1761, and sat for Hindon. The ministry of Lord Bute marked their approbation of his conduct by granting him in 1762 a patent of precedence to rank as king's counsel, and by appointing him solicitor-general to the queen in the following year. He had previously declined the office of Chief Justice of the Court of Common Pleas in Ireland. About this time he married Sarah, eldest daughter of James Clitheroe, Esq., of Boston House, Middlesex, by whom he had nine children, seven of whom survived him. As he lost his fellowship by marriage, the Earl of Westmorland, then chancellor of the university of Oxford, appointed him principal of New Inn Hall: a year afterwards he resigned this appointment, as well as the Vinerian professorship.

The first volume of the 'Commentaries on the Laws of England' was published at Oxford in 1765. The other three volumes appeared not long afterwards. The work called forth an anonymous pamphlet entitled 'A Fragment on Government,' the author of which was the late Jeremy Bentham. Dr. Priestley also made a fierce attack on some of the opinions which the work contained relative to offences against the doctrines of the Established Church. On the question 'whether a member expelled was or was not eligible in the same parliament,' the opinions which Blackstone expressed in the House of Commons being deemed contradictory to his writings, he was attacked in a pamphlet understood to be written by one of the members. He defended himself in a pamphlet which 'Junius' noticed in his 'Letters.' With Priestley and 'Junius,' and the author of the 'Fragment on Government,' as his opponents, the ministry of the day (Lord North's) naturally became his protectors, and continued their favours towards him. In 1770 he was offered the situation of solicitor-general, which he declined. He was then made one of the justices of the Court of Common Pleas. Previous however to his patent being passed, Mr. Justice Yates expressed a wish to retire from the Court of King's Bench into the Court of Common Pleas, an arrangement to which Sir W. Blackstone, from motives of personal regard, at once consented. Four months afterwards, on the death of Mr. Justice Yates, he removed to the Court of Common Pleas. He sat in the Court of Common Pleas till his death, which occurred February 14, 1780, from a dropsical complaint.

As a judge, Sir William Blackstone had a great respect for the usages and formalities which surround the bench, and he strove to impress others with the same feeling. His political sentiments were of the class called moderate. He disliked the contentions of parties, and one of the consequences of his elevation, on which he most congratulated himself, was his removal from the House of Commons, "where," as he used to observe, "amidst the rage of contending parties, a man of moderation must expect to meet no quarter from any side." His talents for business were very superior, and some offices which he had undertaken at the university he discharged with great advantage to the interests of those concerned. He kept his own accounts with rigorous exactitude. His brother-in-law, who drew up a memoir of his life, which is prefixed to the 'Reports' published after his death, says that "he was an excellent manager of his time, and extremely rigid in observing the hour and minute of an appointment." It may be stated, on the same authority, that in private life he was a cheerful and facetious companion; a faithful friend; an affectionate husband and parent; economical, but at the same time charitable and generous. He was severe to those less strict than himself in the observance of the ordinary duties of life; and as he advanced in years, his temper, which was somewhat irritable, was rendered worse by a nervous affection. The university of Oxford contains several memorials to his honour. In 1784 a statue by Bacon was erected in All Souls' College, and in one of the windows of the chapel belonging to this college are placed his arms. His portrait was presented to the picture gallery by the scholars on the Vinerian foundation.

The 'Commentaries' have been edited by Coleridge, Archbold, Williams, Chitty, Christian, and Lea, each of the six editions being in four vols. 8vo, with notes. The best edition is that of Stephen. They have been abridged by Curry, by Gifford, and also by Warren; published in the form of letters in one volume 8vo; and 'elucidated' by Jones. With the exception of Burn's 'Justice,' perhaps no law-book, and few books of any kind, have had a sale equal to that of the 'Commentaries.' ('Life of Sir W. Blackstone,' by Clitheroe; 'Life,' by Thomas Lee, Esq.) On the appearance of the fourth volume of Blackstone's 'Commentaries,' Dr. Priestley published some remarks written with great acrimony and considerable vigour, on those passages which related to the dissenters. The pamphlet is dated Leeds, July, 1769. 'The Reply' of Blackstone (dated Wallingford, 1769) is in a calm and moderate, but feeble tone, and forms a curious contrast with the vigorous argument and somewhat coarse invective of Priestley. The commentator admits that one of the passages animadverted upon is

"somewhat incorrect and confused;" but declares that his views towards the dissenters are very different from what Dr. Priestley imputes to him. Several of these obnoxious passages were modified or cut out in subsequent editions of the 'Commentaries.'

The number of testimonials in favour of the 'Commentaries' is doubtless much greater than the number which can be quoted against them. The weight of opinion perhaps lies on the other side. In the admirable Preface to his 'Fragment,' Bentham clearly points out the fundamental error of Blackstone, the source of his endless confusion. "There are two characters," he says, "one or other of which every man who finds anything to say on the subject of law may be said to take upon him; that of the expositor, and that of the censor. To the province of the expositor it belongs to explain to us what, as he supposes, the law is; to that of the censor, to observe to us what he thinks it ought to be.—Of these two perfectly distinguishable functions, the former alone is that which it fell necessarily within our author's province to discharge." These two provinces Blackstone has confounded all through his work: he continually mixes up with his exposition of what the law is, the reasons why it is so; and as the reasons frequently appear not the best in the world, it often happens that the absurdity of the law, which, if simply stated by itself, would have been regarded as a fact and nothing more, is surpassed by the absurdity of the reason given for it. Hence arises, as Bentham remarks, the continual use of the words *for*, *because*, *since*, by Blackstone. The instances to which Bentham refers are a fair specimen of the whole work, and two or three will serve for illustration as well as a larger number, which may easily be collected from almost every page.—"Burglary cannot be committed in a tent or booth erected in a market fair: though the owner may lodge therein: for the law regards thus highly nothing but permanent edifices; a house, or church, the wall or gate of a town; and it is the folly of the owner to lodge in so frail a tenement." "There needs no formal promulgation to give an act of parliament the force of a law, as was necessary by the civil law with regard to the emperor's edicts: because every man in England is, in judgment of law, party to the making of an act of parliament, being present therat by his representative." The law, according to the 'Commentaries,' first says that a man is present where he is not and cannot be, and then, according to a general principle, turning this fiction into a fact, very properly concludes, that as the man was present when the law was made, it is quite unnecessary to give him any further notice of it.

This kind of objection applies to every part of the 'Commentaries;' the author has not kept to his province of stating what law is, but continually goes out of his way to give reasons which are not required nor wanted. (See an instance in the chapter on the 'Law of Descents,' in the short paragraph beginning "We are to reflect," &c., ii. p. 211, Chitty's ed., which the utmost attainable degree of confusion pervades; the remark on the policy of allowing a man to devise his lands by will, ii. p. 374; and the remark on the "piety of the judges," ii. 375.) Blackstone is only excusable for mixing up his reasons with his law, when he traces the history and historical causes of a law; and even here, and in all matters that belong to the constitutional history of the country, he has long since been pronounced to be very far from profound by very competent judges. His illustrations derived from the Roman law, which are not unfrequently, are not always pertinent, and sometimes not correct. His learning, though not wanting in surface, was evidently deficient in depth.

It remains briefly to notice, and more briefly than the importance of the subject demands, the arrangement of the matter of law in Blackstone; for with the facts of law as stated by him we have little to do. The work as far as it goes is useful; at least on this point there is not so much difference of opinion. In Blackstone's chapter on the 'Absolute Rights of Individuals,' we have his fundamental definition of law, which, coupled with his views contained in the Introduction, will sufficiently account for the confusion that prevails in numerous passages. (See vol. i. p. 133, and indeed the whole of the chapter entitled 'Of the Absolute Rights of Individuals.') In this chapter he says that the "primary and principal objects of law are rights and wrongs." 'Rights,' he subdivides into—"first, those which concern and are annexed to the persons of men, and are then called *jura personarum*, or 'the rights of persons;' or they are, secondly, such as a man may have over external objects or things unconnected with his person, which are styled *jura rerum*, or 'the rights of things.'" He divides 'wrongs' into 'private' and 'public,' the foundation and the nature of which division must be sought in those writers who adopt it. (See Blackstone, i. 122, &c.) In his division of his matter into these great heads, and the subdivision of these heads into their several parts, Blackstone followed the 'Analysis' of Hale, though, so far from improving upon it, his division and arrangement are very much inferior.

The singular confusion in Blackstone's notions of the rights of persons and things is rendered still more apparent by comparing the first chapter of vol. ii. of 'Property in General,' with the beginning of chap. 2 of the same volume, where he comes to speak of the division of property into things 'real' and 'personal,' according to the system of English law. He borrowed the terms 'rights of persons and things' from Hale's 'Analysis,' who however has used them in a sense far less objectionable than Blackstone.

BLACKWELL, THOMAS, was born at Aberdeen in 1701. His

father was one of the ministers of that city, and filled at the same time the office of principal of Marischal College. After having taken the degree of A.M. in the University of Aberdeen, at the age of seventeen, and been appointed by the crown professor of Greek in the Marischal College in 1723, he succeeded his father as principal in 1748. In 1752 the degree of LL.D. was conferred upon him. He had the merit of introducing an improved system of education into Marischal College, and before his death had the gratification of witnessing its success. An account of this plan was printed by direction of the college authorities.

Blackwell is allowed to have been a man of considerable acquirements, but he often rendered himself ridiculous by his pedantry and affectation of universal knowledge. He was well versed, according to the learning of that day, in the Greek and Latin writers, and was acquainted with the principal languages of modern Europe. His habits were studious and retiring, but he rather courted the acquaintance of men of superior reputation. Being afflicted with a consumptive disease, he left Aberdeen in February 1757, with a view of trying the effect of a change of air, but he died at Edinburgh in the following month.

The following is a list of his works: 'An Inquiry into the Life and Writings of Homer,' 1735; 'A Key to the Inquiry, containing a translation of the numerous Greek, Latin, Spanish, Italian, and French notes in the original work,' 1736; 'Letters on Mythology,' 1748; 'Memoirs of the Court of Augustus,' 3 vols.; the first was published in 1753, the second in 1755, and the third, which is incomplete, was published in 1764, after his death.

BLAINVILLE, HENRI MARIE DUCROTAY DE, a distinguished zoologist, was born at Arques near Dieppe, September 12, 1778, of a noble and ancient family. He went first to the military school at Beaumont-en-Auge, being destined for the army; but left it suddenly in 1792, and as is said shipped on board a channel cruiser, and took part in sundry engagements with English vessels. Afterwards he entered the École de Genie at Paris, and was drawn for the conscription of 1798, but obtained exemption through a partial stiffness of the right arm caused by an accident. He remained at Paris without any definite plan of life, occupying himself in a desultory manner by attending lectures on the natural sciences, and by drawing and painting, in which he became very expert. He had reached the age of twenty-seven when, having heard one of Cuvier's eloquent lectures at the Collège de France, he resolved on devoting himself to the science of comparative anatomy, and at once entered as student in the School of Medicine. Here he took his degree of Doctor of Medicine in 1808, after three years of study; and chose as the subject of his inaugural dissertation, the influence of the eighth pair of nerves in respiration, as demonstrated by his own experiments.

The science of anatomy now became De Blainville's sole pursuit. His remarkable skill as a draughtsman led to his merits being recognised by Cuvier, who employed him as practical anatomist and artist at a salary of 2000 francs a year; and the great zoologist was so impressed by his assistant's ability, that he intrusted to him the delivery of a part of his course of lectures on zoology at the college. It was De Blainville's ambition to become professor, and in 1812 he competed with other candidates for the chair of zoology and physiology at the Faculty of Sciences. Having won the honourable post, he defended his well-known thesis 'On the Natural Affinities of the Ornithorhynchus Paradoxus.'

A flattering political position, obtained through his influential family connections on the restoration of the Bourbons, was offered to De Blainville; but he resisted the allurements of public life for his favourite science. He came to England in 1816, and during a short stay, made diligent use of his opportunities for adding to his zoological knowledge, and carried away drawings of the rare *Mollusca* in the British Museum, and of anatomical specimens in the museum of the Royal College of Surgeons. Some of his papers published in the 'Bulletin de la Société Philomatique,' bear testimony to the good use he made of his sojourn in this country.

In 1825 De Blainville was elected a member of the Academy of Sciences at Paris. On the retirement of Lamarck in 1830, he was appointed to the chair of the natural history of *Mollusca* and *Radialia* at the Jardin des Plantes; and on Cuvier's death in 1832, he was appointed to succeed that great anatomist as professor of comparative anatomy in the same establishment. Thus in twenty-eight years after his resolve on a life of scientific study, he found himself as the result of his persevering labours, in the chair of his master, and acknowledged head of one of the most important branches of science. In the same year he was elected a foreign member of the Royal Society, and subsequently of the Geological Society of London. He was also a member of other scientific societies on the continent.

De Blainville availed himself of his new position to commence what has since been recognised as his great work: 'Ostéographie, ou Description iconographique comparée du Squelette et du Système dentaire des cinq classes d'Animaux vertébrés récents et fossiles,' &c. Twenty-three parts of this magnificent work had been published, and the author had corrected the twenty-fourth part (*Camelus*), when on the arrival at Rouen of a railway train in which he had taken a place, he was found in a state of apoplectic insensibility. This was the 1st of May 1850. On the previous day he had delivered his usual
